PREFACE

GASTROENTEROLOGY ABSTRACTS and CITATIONS is a publication of the National Institute of Arthritis and Metabolic Diseases. This specialized information medium has been initiated to fill an existing great need in the field of gastroenterology and to assist the Institute in meeting its obligations to foster and support laboratory and clinical research into the nature, causes, and therapy of diseases of the gastrointestinal tract. Publication of GASTROENTEROLOGY ABSTRACTS and CITATIONS makes available citations of all current papers relevant to this field from medical journals published throughout the world. Approximately one-third of the citations dealing with the major aspects of gastroenterology have accompanying abstracts.

The issuing of GASTROENTEROLOGY ABSTRACTS and CITATIONS under the auspices of the National Institute of Arthritis and Metabolic Diseases will provide a much needed current awareness tool to scientists and will facilitate greater integration of research and clinical efforts in this field. The number and great diversity of publications in the area of gastroenterology makes it imperative that an appropriate service be available to investigators and practitioners so that they may be apprised of progress with a minimum of delay. Our aim is to provide the readers with a readily systematized compilation of current published work. The publication will provide the greatest usefulness if these interested investigators will contribute their ideas and comments for consideration whenever possible.

GASTROENTEROLOGY ABSTRACTS and CITATIONS is published monthly and includes citations and abstracts from the biomedical world literature as they are currently received. In addition, yearly cumulated subject and author indexes are published.

This publication is available free to National Institutes of Health grantees and contractors working in the field of gastroenterology and libraries of medical schools. Requests from these qualified individuals to receive free copies of this publication must include their grant or contract number and the title of their project. These requests as well as address changes and other communications should be addressed to:

Scientific Communications Office
Gastroenterology Abstracts and Citations
National Institute of Arthritis and Metabolic Diseases
National Institutes of Health
Bethesda, Maryland 20014

Other individuals and libraries may receive this publication by subscribing *directly* to the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Subscription price per year in the United States, Canada, and Mexico, $16.00; foreign, $4.00 additional; and $1.25 for a single copy. Payment is required in advance, and check or money order should be made payable to the Superintendent of Documents.

MORPHOLOGY, CELLULAR STRUCTURE AND HISTOCHEMISTRY

4688 DISULFIDE REDUCTION IN RAT LIVER: I. EVIDENCE FOR THE PRESENCE OF NONSPECIFIC NUCLEOTIDE-DEPENDENT DISULFIDE REDUCTASE AND GSH-DISULFIDE TRANSHYDROGENASE ACTIVITIES IN THE HIGH-SPEED SUPERNATANT FRACTION. *(E.)* Tietze, F. (Natl. Inst. Arthritis Metab. Dis., Natl. Inst. Hlth., Bethesda, Md.). *Arch Biochem Biophys* 138(1):177-188, 1970.

The subcellular distribution and metabolic characteristics of microsomal disulfide-reducing systems were studied in rat liver and other mammalian tissues, and the presence (in the high-speed supernatant fraction of rat liver) of enzyme systems catalyzing the reduction of disulfide bonds of proteins was investigated. Enzyme extractions and assay procedures were carried out at pH 7.5 in 0.1M phosphate or Tris buffers containing 5mM EDTA. Subcellular fractions of fasted male Sprague-Dawley rats were prepared by differential centrifugation of homogenates in 0.01 M Tris - 0.25 M sucrose. Enzymatic reduction of disulfide bonds by reduced pyridine nucleotide was determined by measurement of the formation of sulfhydryl groups with 5,5'-dithiobis-(2-nitrobenzoic acid) or by measurement of the rate of oxidation of reduced pyridine nucleotide by differential spectrophotometry at 340 mμ. Dialyzed preparations of the 100,000 g supernatant extract of rat liver were found to promote the reduction of the disulfide bonds of protein (insulin) and nonprotein substrates when supplemented with NADPH, but not with NADH. The addition of NADPH to a mixture of the extract and insulin resulted in a steady rise in total sulfhydryl content of the reaction mixture from a baseline value of 0.6 μmoles sulfhydryl to nearly 2.5 μmoles in 4.5 hr, while addition of NADH resulted in a value of only 0.7 μmoles of sulfhydryl content in 4 hr. Extracts of the microsomal and mitochondrial fractions were inactive in reducing sulfhydryl bonds in the presence of both NADPH and NADH. Spectrophotometric measurements (at 340 mμ) of the utilization of reduced pyridine nucleotides in the insulin-microsomal supernatant reaction mixtures indicated that the addition of insulin to the mixture resulted in a linear increase in relative absorbance (0.35 O.D. units in 8 min) in the presence of NADPH, but no change in absorbance in the presence of NADH. Extension of these spectrophotometric studies to reactions with cystine and lipoic acid further demonstrated the specificity of the reaction. The D- and L- forms of cystine were reduced by the enzyme system at equal rates. The supernatant fraction also exhibited an arsenite-insensitive GSH-disulfide transhydrogenase activity capable of catalyzing the reduction of both protein and nonprotein disulfide substrates by GSH when coupled with NADPH and glutathione reductase.

4689 DISTRIBUTION OF PHOSPHOPYRUVATE CARBOXYLASE IN PIG LIVER. *(E.)* Swiatek, K. R. (U. Illinois Coll. Med., Chicago), K. L. Chao, H. L. Chao, M. Cornblath and T. Tildon. *Biochim Biophys Acta* 206(2):316-321, 1970.

The cellular distribution and kinetics of phosphopyruvate carboxylase were studied spectrophotometrically in nuclei, mitochondria, microsomes and particle-free fractions of liver from fed and fasted (72 hr) pigs. In both fed and fasted pig livers, the cellular distribution of phosphopyruvate carboxylase was 60-70% in the soluble cell fraction and 15-25% in the mitochondrial cell component. The specific activity (μmole oxaloacetate/mg protein/min) of phosphopyruvate carboxylase in the soluble and mitochondrial fractions from fed pig liver were measured as 0.065 and 0.096, resp., while in the fasted pig liver, a two-fold increase in the specific activity occurred; activity in the soluble fraction measured 0.176 and mitochondrial fractions 0.181. The total protein content of both the soluble and mitochondrial cellular fractions were essentially identical in livers from fed and starved animals. The K_m constants for pig phosphopyruvate carboxylase at pH 6.4 obtained from 100,000 x g cell supernatant were phosphoenolpyruvate, 6.65×10^{-4} M; Mn^{2+}, 8.33×10^{-4} M; $NaHCO_3$, 1.47×10^{-2} M; and IDP, 5.4×10^{-5} M. Phosphopyruvate carboxylase activity in supernatant fractions prepared from livers stored at -60° for up to 35 days remained unchanged, however particle-free supernatants frozen and thawed several times lost 27% of activity, and supernatants at 4° lost almost 50% of activity after 35 days.

4690 DNA POLYMERASE PATTERNS IN DEVELOPING RAT LIVER. *(E.)* Ove, P. (Dept. Anat. Cell Biol., U. Pittsburgh, Pa.), M. D. Jenkins and J. Laszlo. *Cancer Res* 30(2):535-539, 1970.

Fetal and developing rat tissues were assayed for DNA polymerase using the Mantsavinos isolation and assay procedure and Sephadex G-200 fractionation. Six days before birth, fetal rat liver had a preference for denatured DNA primer (enzyme activity 4.32 mμmoles/mg protein fraction/hr thymidine triphosphate-^3H incorporated) over native DNA (1.64 mμmoles/mg protein fraction/hr). Fetal kidney (2.77 mμmoles/mg protein fraction/hr) and spleen (7.31 mμmoles/mg protein fraction/hr) also showed a preference for denatured DNA (values for native DNA were 0.66 and 1.40, resp.). One day prior to birth the enzyme activity for fetal liver decreased to 0.8 mμmoles/mg protein fraction/hr. The chromatographic elution of the pH 5.0 protein fraction on Sephadex G-200 yielded two distinct peaks. Peak I activity was higher for denatured DNA primer and was very high in fetal liver 6 days before birth while at birth, the activity was barely detectable (as in normal rat liver). Peak II polymerase activity increased until 1 week after birth at which time it decreased to the adult level. Peak I DNA polymerase seemingly is characteristic of fetal rat liver and may decrease during malignant transformation.

4691 MULTIPLE MONOAMINE OXIDASES IN RAT LIVER MITOCHONDRIA. *(E.)* Sierens, L. (Dept. Biochem., U. Ottawa, Canada) and A. D'Iorio. *Canad J Biochem* 48(6):659-663, 1970.

A radioisotopic assay for monoamine oxidases based on the enzymes' affinities for labeled and unlabeled benzylamine and serotonin was performed on rat liver mitochondria. For serotonin, the apparent Michaelis constant was $1.4 \times 10^{-4} \pm 4.3 \times 10^{-5}$ and was significantly different from the apparent inhibitor constant for substrate amines of $1.2 \times 10^{-2} \pm 4.4 \times 10^{-3}$, as determined in whole rat liver mitochondria. Similarly, the benzylamine apparent Michaelis constant was $2.5 \times 10^{-4} \pm 3.3 \times 10^{-5}$ compared with an apparent inhibitor constant of $2.1 \times 10^{-4} \pm 9.6 \times 10^{-5}$. Electrophoresis of the solubilized mitochondria yielded two peaks of activity. The difference in activity was confirmed by data on enzyme activity after elution from the gel and concentration by ultrafiltration. With labeled benzylamine as substrate, activity corresponding to peak I emitted 46.5 counts per min. and that corresponding to peak II emitted 451.3 counts per min and when labeled serotonin was the substrate, peak I emitted 102 counts per min compared with 3 counts per min from peak II. Hepatic mitochondria of rats seemingly contain different types of monoamine oxidase activity.

4692 ENZYME AND TEMPLATE STABILITY AS REGULATORY MECHANISMS IN DIFFERENTIATING INTESTINAL EPITHELIAL CELLS.

(E.) Balis, M. E. (Cornell U. Med. Coll., New York, N. Y.), A. R. Imondi and M. Lipkin. *J Biol Chem* 245(9):2194-2198, 1970.

Effects of actinomycin D (an inhibitor of RNA synthesis) and of cyclohexamide (an inhibitor of protein synthesis) on the activities of adenosine deaminase, thymidine phosphorylase, and purine nucleoside phosphorylase were studied in intestinal epithelial cells of Wistar rats. Activities of adenosine deaminase, thymidine phosphorylase, and nucleoside phosphorylase increase approximately 12-fold, 10-fold, and 5-fold, resp., from jejunal crypts to tips of villi. Purine nucleoside phosphorylase is relatively stable in the villus cells, but in the crypt cells is labile, and its synthesis is subject to inhibition by cyclohexamide. Both adenosine deaminase and thymidine phosphorylase undergo rapid turnover, although their rate of synthesis exceeds their rate of degradation. Adenosine deaminase is synthesized from an unstable template, in contrast to thymidine phosphorylase which is synthesized from a template which is stable for over 3 hr. The differential turnover of proteins and templates seemingly is one of the regulatory mechanisms operating within intestinal epithelial cells and is involved in controlling enzymic patterns characteristic of their differentiative process.

4693 METABOLISM OF NATURALLY OCCURRING HOMOPOLYMERS I. THE ISOLATION AND METABOLISM OF ADENINE-RICH POLYNUCLEOTIDES OF MOUSE LIVER.

(E.) Lim, L. (Yale U. Sch. Med., New Haven, Conn.), Z. N. Canellakis and E. S. Canellakis. *Biochim Biophys Acta* 209(1):112-127, 1970.

A method for the isolation of the naturally occurring purine polymucleotides (polyadenylic acid and polyguanic acid) from the extracts of mouse liver was developed and was used in a study of the metabolism of the naturally occurring, adenine-rich hepatic nucleotides. The mice (BDF-1 strain, males) were starved for 16 hrs, injected at different times with labeled ^{32}P, and then were sacrificed. Livers were removed and were homogenized in 0.44M sucrose as a 20% homogenate. Mitochondrial fractions were separated by ultracentrifuge, the purine nucleotides were separated by a controlled nuclease digestion, and chromatography on polystyrene columns was performed. Radioactive samples of RNA were hydrolysed with carrier RNA, the hydrolysate was separated into constituent nucleotides using paper chromatography, and radioactivity was determined by scintillation counts of the chromatograms. Nuclear polynucleotides were synthesized in concert with bulk RNA, as determined by parallel absorbance and radioactivity of these compounds. In the ribosomes the purine nucleotides were characterized by a more rapid labeling of the adenine-rich fraction (77% of ^{32}P in nucleotide at 2 hr) than the guanine-rich fraction (15% of ^{32}P in nucleotide in 2 hr). The membrane fraction (derived by deoxycholate treatment of microsomes) contained purine polynucleotides that were predominantly adenine-rich (15%) and formed a large part of the bulk RNA of this fraction. The synthesis of the membrane polynucleotides was resistant to inhibition by actinomycin D, although actinomycin D (1.5 mg/kg) inhibited the synthesis of ribosomal RNA by 80% in cellular fractions, and inhibited the uptake of ^{32}P into nuclear RNA by 55%.

4694 FURTHER STUDIES ON THE SUBCELLULAR ENZYMES OF RAT LIVER IN ACUTE THREONINE DEFICIENCY.

(E.) Wilfred, G. (Christian Med. Coll., Vellore, India) and T. N. Sekhara Varma. *Biochim Biophys Acta* 208(2):328-330, 1970.

The activities of characteristic enzymes of liver nuclei (NMN adenyltransferase), lysosomes (arylsulphatase A, acid phosphatase and α-glucosidase), and soluble supernatant fraction (fructose-1,6-diphosphatase and UDP-glucose pyrophosphorylase) were measured in rats force-fed a threonine-free diet and compared to those in rats fed a complete diet. NMN adenyltransferase activity (nm NAD^+/20 min/mg protein) was similar in the threonine-deficient rats (18.1) and the normal rats (17.4). The diphosphatase and pyrophosphorylase activities of the soluble supernatant fraction were not affected by threonine deficiency. Although the ratio of free activity (determined in the absence of Triton X-100) to bound activity (with Triton) of the lysosomal enzymes remained unchanged and acid phosphatase and α-glucosidase activities were unaltered, arylsuphatase A activity was significantly increased in threonine deficiency (free activity per whole liver rose from 58.5 to 109.1 and per mg of protein from 0.17 to 0.26).

4695 LIPID COMPOSITION OF NUCLEAR MEMBRANES ISOLATED FROM BOVINE LIVER.

(E.) Keenan, T. W. (Dept. Anim. Sci., Purdue U., Lafayette, Ind.), R. Berezney, L. K. Funk and F. L. Crane. *Biochim Biophys Acta* 203(3):547-554, 1970.

Nuclear membrane fractions isolated from beef-liver nuclei by treatment with deoxyribonuclease and $MgCl_2$ contained about 0.33 mg lipid per mg protein with a protein to total lipid ratio of 2.96. The total membrane lipids consisted of 62% phospholipids and 38% neutral lipids, with no non-phosphorus-containing polar lipids. Based on lipid phosphorus distribution, the major phospholipids were phosphatidylcholine (55%), phosphatidylethanolamine (23%), phosphatidylinositol (8%), phosphatidylserine (6%), and sphingomyelin (6%). Unesterified cholesterol (42%) and free fatty acids (36%) were the major neutral lipid components in nuclear membrane fractions. Phosphatidylcholine was the least saturated and sphingomyelin the most saturated of the major phospholipids. Eighteen-carbon chain-length fatty acids accounted for 70% of the acyl residues of the total lipid fraction, and the palmitic to oleic acid ratio was 0.55.

4696 ELECTRON MICROSCOPIC OBSERVATIONS ON THE INNERVATION OF THE INTESTINAL INNER MUSCLE LAYER. *(E.)* Gabella, G. (Dept. Anat., U. Turin, Italy). *Experientia* 26(1):44-46, 1970.

The ultrastructure of the intramuscular plexus from the inner muscle layer of small intestine from 4- to 6-month-old albino rats was examined with the electron microscope. Intramuscular nerve fibers range from 0.1 to 1.8 μ in diameter and were located adjacent and parallel to the smaller blood vessels. It was not possible to distinguish between the true intramuscular and perivascular nerve fibers, since each bundle type was intimately related to the smooth muscle cell of the tunica muscularis. Three distinct types of varicosities or vesiculated nerve processes were observed, but the only nerve fibers identified were the fibers with small, dense-core, catecholamine storage vesicles (which are postganglionic orthosympathetic fibers of extrinsic origin). Nerve processes with similar vesicles were observed inside the ganglia of Auerbach's plexus.

4697 A STIMULATING FACTOR FOR DNA TRANSCRIPTION FROM RAT LIVER. *(E.)* Nohara, H. (Niigata U. Sch. Dent., Japan), K. Iizuka, T. Mizuno and A. Igarashi. *Biochim Biophys Acta* 209(1):86-96, 1970.

A stimulating factor for the transcription of rat liver DNA was isolated and purified from rat liver supernatant, and its mode of action was studied. In an attempt to obtain an RNA-synthesizing system which was resistant to nuclease action, a ribonuclease inhibitor fraction was prepared from rat liver through DEAE-cellulose column chromatography, and it was observed that addition of this inhibitor enhanced the incorporation of labeled GTP by a system including liver DNA and *E. coli* RNA polymerase. This ribonuclease inhibitor fraction was further purified on a hydroxylapatite column and was obtained as the HA-4 fraction which had no activity as a template DNA and polymerase, but was able to promote the transcription of rat liver DNA by a purified *E. coli* polymerase. Rat liver (undenatured) used as a DNA template incorporated 0.657 nmoles of AMP without addition of the stimulating factor, and 1.229 nmoles of AMP in the presence of the factor; while in the *E. coli* preparation, the amount of AMP incorporated in the absence of the stimulating factor was 0.190 nmoles, and with the stimulating factor was 0.199 nmoles. The fraction HA-4 was incubated for 5 min at 50° and 60°, which resulted in a 49% and a 75% inactivation of the DNA stimulating activity, resp. When the incorporation of radioactive phosphorus-labeled ATP was measured in the RNA polymerase reaction primed with DNA (in the presence and absence of the HA-4 fraction) the incorporation of ATP increased with increasing amounts of the stimulating factor. The RNA synthesis incubation system without fraction HA-4 incorporated 4.09 pmoles of ATP, while the system with 4 μg of fraction HA-4 incorporated 4.77 pmoles of ATP, and with 8 μg of the factor, 5.96 pmoles of ATP were incorporated. The stimulating factor seemingly functions in the initiation of RNA synthesis, but not in chain elongation.

4698 A QUANTITATIVE HISTOCHEMICAL STUDY OF INTESTINAL MUCOSA AFTER X-IRRADIATION. *(E.)* Gaijaard, H. (Med. Biol. Lab., Nat. Defense Org., Rijswijk, Netherlands), J. Buys, M. Van Duuren and J. Giesen. *J Histochem Cytochem* 18(4):291-301, 1970.

The effects of low doses of X-irradiation (50-400 R) on enzyme activity in crypts and villi of Wistar rat intestinal mucosa was studied by histochemical staining methods and microchemical analyses of frozen-dried sections. With irradiation doses up to 400 R, there was no change in activities of enzymes which are localized exclusively or mainly in villus epithelium (leucine aminopeptidase, alkaline phosphatase, acid phosphatase, 5-nucleotidase and adenosine triphosphatase) or are evenly distributed along epithelium of crypts and villi(succinic dehydrogenase, β-hydroxybutyrate dehydrogenase, and isocitrate dehydrogenase). Lactic dehydrogenase and glucose-6-phosphate dehydrogenase activities were slightly decreased in crypts and villi from 48-96 hr after a dose of 400 R and from 48-72 hr after 200 R. Irradiation (50-400 R) markedly decreased nonspecific esterase activity both in crypt and villus epithelium and this occurred 36 hr after irradiation and was not dose dependent. Duration of the irradiation effect and number of crypt cells increased with higher irradiation doses. Quantitative analysis showed that esterase activity in the villi (mean, 23.6 μmoles/mg) was approximately 4-5 times higher than activity in crypts (5.1 μmoles/mg). The quantitative study was in agreement with information from histochemical staining methods. The observation that some intestinal functions are impaired while others are not after irradiation seemingly may be explained by different localization and activity in crypt epithelium of enzymes involved in various intestinal functions.

4699 METABOLISM OF NATURALLY OCCURRING HOMOPOLYMERS II. CHARACTERIZATION OF ADENINE-RICH POLYNUCLEOTIDES OF MOUSE LIVER RIBOSOMES. *(E.)* Lim, L. (Yale U. Sch. Med., New Haven, Conn.), Z. N. Canellakis and E. S. Canellakis. *Biochim Biophys Acta* 209(1):128-138, 1970.

The metabolic activity and response to actinomycin D of the nucleotides found in association with mouse liver ribosomes was studied. Homogenates of mouse liver were fractionated, RNA was extracted and purine polynucleotides were isolated by elution with sodium dodecyl sulfate of RNA digest chromatographed on polystyrene columns. Fragments of rough endoplasmic reticulum and free polysomes were obtained and a differential pH extraction of RNA from free and bound membrane ribosomes was performed. Ribosomal subunits were dissociated by EDTA and were separated by sucrose density-gradient centrifugation. Total ribosomal RNA, up to 3 hr after labeling with ^{32}P had a specific activity of 1,473 counts/min compared with a membrane RNA specific activity of 22,431 counts/min, however there was 15 times more RNA in the ribosomes than in the membrane fraction. The specific activities of adenylic acid and guanylic acid after alkaline and enzymatic hydrolysis were compared for the 5'-nucleotides and the 2'-3'-nucleotides, and had a ratio of adenylic acid/guanylic acid varying from 2.5 to 3.0 in all cases studied (this indicated that the sodium dodecyl sulfate fraction consists primarily of clusters of adenine nucleotides and clusters of guanine nucleotides and the ^{32}P exists as a link between similar nucleotides). A small molecular weight polyadenylic acid of about 20 nucleotides was synthesized by an actinomycin D-dependent pathway. Within 1 hr after administration of actinomycin D, spectrophotometric analysis showed that this compound appears in the 16-S region and within 4 hr it is associated with the 32-S region of the free ribosomes. A larger molecular weight polydadenylic acid (in the 4-5-S region) was synthesized by an actinomycin D-independent pathway and was in association with the membrane fraction of the bound ribosomes (3-5-S region), but was not found in association with either the 47S or the 32S region of the bound ribosomes.

4700 IMMUNOFLUORESCENT LOCALIZATION OF ORNITHINE AMINOTRANSFERASE IN RAT LIVER. *(E.)*

Brennan, P. C. (Argonne Nat. Lab., Ill.), C. Peraino, R. J. M. Fry and R. W. Swick. *J Histochem Cytochem* 18(4):264-267, 1970.

Immunofluorescent localization of ornithine aminotransferase (L-ornithine:2-oxoacid aminotransferase, EC 2.6.1.13) was studied with an indirect fluorescent antibody technique in livers of Sprague-Dawley rats fed various diets differing in protein content. Brilliant fluorescence was observed in liver mitochondria from rats fed 60% protein diet treated with antiserum; numerous fluorescent cells appeared throughout liver lobules. Stained hepatic cells of rats fed 24% protein diet (standard laboratory diet) appeared less numerous and fluorescence was less intense than in rats fed a 60% protein diet. No specific fluorescence was observed in livers from rats fed a 0% protein diet. Data correlated well with ornithine aminotransferase activity measurements in extracts of livers from rats fed similar diets. These techniques appear useful for further studies of enzyme localization in normal and diseased livers.

4701 PANCREAS ACINAR CELL DIFFERENTIATION: III. IMPORTANCE OF METHIONINE IN DIFFERENTIATION OF PANCREAS ANLAGE IN ORGAN CULTURE. *(E.)*

Fitzgerald, P. J. (St. U. New York, Downstate Med. Ctr., Brooklyn), I. Parsa and P. J. Fitzgerald. *Amer J Path* 59(1):1-11, 1970.

Dorsal pancreas anlage of Wistar rat embryos at day 13 of enbryogenesis were used to study the importance of methionine in the differentiation of the pancreas anlage in organ culture. In the methionine-deficient culture medium, growth of the pancreas anlage was almost as much as that in a control medium containing methionine but significant differentiation was absent in the explant growth. No zymogen granules were formed and there was relatively little increase in the enzymatic activities of amylase, lipase, or chymotrypsin, as compared to activities in explants grown in control medium. In explants grown in a culture medium identical to the methionine-containing medium, except for a single amino acid that was deleted from the basal medium, there was (after 9 days culture) minimal growth of the explant in each case. In all single amino acid deficiencies tested (other than methionine) some acini were formed and zymogen granules could be recognized by light microscopy in at least a few of the acinar cells. Growth of the culture was very poor and there was far more necrosis in the explant cultured in a single amino acid-deficient medium than was present cultured in the methionine-deficient medium. Examination of the culture after 8 days in the methionine-deficient medium and 1 day exposure to methionine or S-adenosyl-methionine, revealed the presence of considerable ergastoplasm, some zymogen granules, and many prozymogen vesicles and increases in amylase, chymotrypsin and lipase activities.

4702 STUDIES ON THE MECHANISM OF DECREASE IN THE RIBONUCLEIC ACID CONTENT IN LIVER CELLS OF FASTED RATS: EFFECT OF STARVATION ON RIBONUCLEIC ACID DEGRADATING AND SYNTHESIZING SYSTEMS. *(E.)*

Onishi, T. (Sch. Med., Tokushima U., Japan). *J Biochem* 67(4):577-585, 1970.

Studies on mechanism of decrease in RNA content were conducted in liver cells of fasted Wistar rats. Rats fasted from 1 to 9 days showed body weight decreases of 10 to 45% of their initial weight. During starvation, contents of nuclear RNA-polymerase, ribosomal RNA-polymerase, and soluble RNA-polymerase (expressed in µg P per µg DNP-polymerase of the liver) decreased exponentially with loss of body weight and at approximately the same relative weights. In a rat which lost 45% of its body weight (after 9 days), values for nuclear, ribosomal, and solube-RNA-polymerases were approximately 55, 49 and 46%, resp., of those in normal rats (nuclear-RNA-P 39 ± 2 µg/g liver; ribosomal-RNA-P 380 ± 31 µg/g liver, and soluble-RNA-P 106 ± 9 µg/g liver). During starvation, rats losing 10% of their body weight showed a polysome content per 100 µg DNA-P of 80% of normal value and then decreased exponentially with body weight loss; polysome profile also showed similar changes following starvation. On loss of up to 20 to 25% body weight, activities of both free and latent forms of alkaline RNase (units/µg DNA-P) were maintained. These levels decrease to 50% of normal level (free form 1.4; latent form 2.4) on loss of 40 to 45% body weight. Acid RNase and alkaline RNase inhibitor activities decreased with body weight loss. Activity of DNA-dependent RNA polymerase, prepared as an aggregate-enzyme, decreased nearly in parallel with decreases in RNA levels during starvation. Levels of ribonucleotides in liver cells were also decreased during starvation.

4703 GLUCOSE-6-PHOSPHATASE AND THIAMINE PYROPHOSPHATASE ACTIVITIES IN THE JEJUNAL EPITHELIUM OF THE MOUSE. *(E.)*

Hugon, J. S. (Med. Ctr., U. Sherbrooke, Quebec, Canada), M. Borgers and D. Maestracci. *J Histochem Cytochem* 18(5): 361-364, 1970.

Glucose-6-phosphatase and thiamine pyrophosphatase activities were studied by electron microscopy in jejunal epithelium of adult mice. Glucose-6-phosphatase activity was observed in all cisternae of rough endoplasmic reticulum and most smooth membrane profiles of the absorbing cells of villus and of stem cells of crypts; activity was also present in double perinuclear space. No precipitate was observed in Golgi apparatus of columnar cells or endoplasmic reticulum of goblet cells. Precipitates were present on brush borders, while faint deposits were found in dense bodies. Glucose-6-phosphatase activity was less pronounced in stem cells of crypts. When glycerophosphate was used in incubation medium, no glucose-6-phosphatase activity was present in endoplasmic reticulum, but high activity was observed in brush border, dense bodies, multivesicular bodies and Golgi cisternae. Thiamine pyrophosphatase activity was observed in cisternae of Golgi apparatus and in all cells of villi and crypts. In columnar cells of the villus, thiamine pyrophosphatase was present in cisternae of smooth and rough endoplasmic reticulum but was absent in endoplasmic reticulum of goblet cells and cells in crypt bottoms.

4704 MIGRATION OF GLYCOPROTEIN FROM GOLGI APPARATUS TO CELL COAT IN THE COLUMNAR CELLS OF THE DUODENAL EPITHELIUM. *(E.)* Bennett, G. (Dept. Anat., McGill U., Montreal, Canada). *J Cell Biol* 45(3):668-673, 1970.

Perfused duodenal segments removed from male albino rats 2.5 to 60 min after i.p. or i.v. injections of ^{3}H-galactose were used to locate the source of apical cell coat material in rat duodenal columnar cells, and to learn about its mode of transport to the cell surface. In segments removed 2.5 min after injection, all villus columnar cells were seen to incorporate label in the supranuclear Golgi region of their cytoplasm. There was no difference in overall intensity or distribution of the label between i.p. and i.v. injected rats. Electron micrographs showed that over 70% of the silver grains were concentrated over the Golgi apparatus which consisted of parallel arrays of three to five flattened saccules whose ends were often dilated. By 10 min after the injection, some radioautographic reaction was still seen over the Golgi apparatus, but a considerable number of grains were localized over the apical region of the cytoplasm. By 1 hr after injection, most silver grains were seen over the microvilli, and some were seen over the hazy surface material covering the sides and tips of the microvilli. A few grains were still seen over the apical cytoplasm as well as the Golgi apparatus and some were also seen over the lateral and basal cell surfaces.

4705 ISOLATION AND OVERALL CHARACTERIZATION OF THE "INNER MATRIX" FROM MITOCHONDRIA OF PRIMATE LIVER CELLS: II. A COMBINED ULTRASTRUCTURAL AND QUANTITATIVE EVALUATION OF THE HIGH PRESSURE-ACCESSIBLE COMPARTMENT. *(E.)* Stoian, I. (I. Cantacuzino Inst., Bucarest, Rumania), S. P. Constantinescu, G. Gherasim and G. Gancevici. *Arch Roum Path Exp Microbiol* 28(2-3):329-346, 1969.

Quantitatively controlled disruption experiments were performed to evaluate exhaustive liberation of high pressure (HP)-accessible fluid from monkey liver mitochondria; disruption was performed in plain, isoosmotic sucrose, at a low organelle: diluent ratio (1:2). Resulting release of highly concentrated fluid phase (HP-solute) accounted for at least 58% of mitochondrial wet mass (v/w) and for 82% of intramitochondrial water (v/v). Normalization of quantitative determinations to *in vivo* values, showed that HP-accessible residue made up some 18% (w/v) of HP-solute and contained 52% protein, 1.5% total lipid and up to 26% free amino acids (w/w). Residue consisted of electron transport bodies of 2.0×10^3 - 1.2×10^4 Å in diameter, and of isolated or moderately clumped, granular electron transparent units ranging from 35 to 95 Å in diameter which displayed a marked conformational lability to pH and temperature changes, within physiological limits. Preparative, electrophoretic and binding assays of electron transparent material revealed existence of free basic protein residues that developed extensive cross-linking and aggregate formation in presence of anionic ligands (DNA, ATP and heparin). The particular behavior of high pressure-proteins in respect to their electrophoretic mobility and pH-dependent binding to DNA anion, suggest that they belong to a class of cationic proteins with strong conformational lability.

4706 CYTOLOGIC CHANGES INDUCED BY STIMULATION OF GASTRIC ANTRUM. *(E.)* Ferguson, D. J. (Dept. Surg., U. Chicago, Ill.). *Bull Soc Int Chir* 29(1):7-14, 1970.

Antral mucosa (15 dogs) was examined histologically before and after chronic stimulation (produced by transplantation either into the biliary tract or colon) and stimulation with acetylcholine, meat extract, acid or bile (in most cases with inclusion of ferritin in the stimulant). The same concentration of ferritin (2.5%) in bile, beef extract or 0.3% acetylcholine did not result in visible entry into the vesicles after 10 to 30 min exposure, but exposure of S-cells to bile produced an increase in number and size of visicles. Some endocrine cells appeared to be extruded through the basement membrane of the gland. E-cells nearly always adjoined the basement membrane but always did not reach the lumen, while most argyrophil cells reached both the basement membrane and the lumen. The relative abundance and distribution of non-mucous glandular cells of the antrum does not suggest anatomic interrelations among them, as they are apparently scattered at random. S-cells, however, are generally absent from the deepest parts of the glands.

4707 MICROSCOPIC STUDY OF THE SYNTHESIS OF CHOLESTEROL IN THE HEPATIC CELL. *(Fr.)* Pascaud, A. (Inst. Sci. Res. Cancer, Villejuif, France), N. Vodovar, P. Auliac and M. Pascaud. *C R Acad Sci* 270(12):1624-1626, 1970.

The synthesis of cholesterol by liver was studied autoradiographically following i.p. injection of

^{3}H-mevalonate (250 mC/100 g) into fasted, Wistar rats. Cholesterol synthesis was found in the whole cell but in greater quantities in the endoplasmic tissue in the immediate area of the mitochondria. The intercellular space of the biliary canaliculus showed little newly synthesized cholesterol, however preferential localization of free (non tritiated) cholesterol occurred in myelin and was particularly abundant in the intercellular spaces.

4708 HEPATIC DRUG-METABOLIZING ENZYME ACTIVITY IN RATS PRETREATED WITH (-)-EMETINE OR (±)-2,3-DEHYDROEMETINE. *(E.)* Miller, H. H. (George Washington U. Sch. Med., Washington, D.C.), R. K. Johnson, J. D. Donahue and W. R. Jondorf. *Biochem J* 117(3):491-498, 1970.

Hepatic drug-metabolizing enzyme activity was studied in female Sprague-Dawley rats pretreated with (-)-emetine or (±)-2,3-dehydroemetine. Pretreatment with either compound at 18 μmol/kg for 24 hr inhibited drug-metabolizing enzyme activity *in vitro* by 50% whereas pretreatment with isoemetine or O-methylpsychotrine had no such effect *in vitro* on demethylation of aminopyrine or on azo reduction of Neoprontosil by liver microsomal fractions. Pretreatment with 18 μmol/kg (24 hr) of emetine or 2,3-dehydroemetine prolonged hexobarbital-induced sleeping-time of treated animals by 63% and 50%, resp., compared to controls; structural analogues had no such prolonging effects of sleeping times at similar doses. Co-administration of emetine or 2,3-dehydroemetine and sodium phenobarbital or 1,1-dichloro-2-O-chlorophenyl-2-p-chlorophenylethane to rats abolished or greatly diminished stimulation of drug-metabolizing enzyme activity *in vitro* usually obtained by administration of phenobarbital or 1,1-dichloro-2-O-chlorophenyl-2-p-chlorophenylethane alone. Inhibitory effects on drug-metabolizing activity *in vitro* exerted by 2,3-dehydroemetine and emetine was not associated with interference in generation of NADPH from NADP$^+$. Structural requirements for amoebicidal activity and inhibitory effects on protein synthesis *in vitro* are consistent with degree of effectiveness in inhibiting rat liver microsomal drug-metabolizing systems.

4709 EFFECT OF MITOMYCIN C ON THE LIVER WITH SPECIAL REFERENCE TO THE CHANGES IN FINE STRUCTURE OF RABBIT LIVER CELLS. *(E.)* Ushijima, H. (Kurume U. Sch. Med., Japan) *Kurume Med J* 17(1): 1-18, 1970.

The effects of massive doses of Mitomycin C on normal liver cells were studied in rabbits by electron microscopy. Macroscopic appearances of liver were normal following administration of 1.0 mg/kg of Mitomycin C for 5 consecutive days (only abnormalities were slight infiltration of lymphocytes). Macroscopic changes 6 hr after a single massive dose (5.0 mg/kg) of Mitomycin C included an increase in number of large polymorphic liver cells, swelling and faint staining of cells (especially in the centrolobular zone) and slight infiltration of lymphocytes. After the administration of 1.0 mg/kg of Mitomycin C for 5 consecutive days, electron microscopic findings revealed vesicular distention of rough endoplasmic reticulum and detachment of ribosomes. Small vesicles or dilated smooth-surfaced endoplasmic reticulum were markably reduced in number within hepatocytes in the peripheral zone. At 6 hr after single administration of 5.0 mg/kg of Mitomycin C there was vesicular and tubular distention of rough endoplasmic reticulum, depletion of glycogen, increased lysosomes, and swollen mitochondria in the peripheral zone and vesicular and tubular distention of rough endoplasmic reticulum, detachment of ribosomes, slightly swollen mitochondria, and cisternal distention of perinuclear space in the central zone. All changes were reversible and diminished at 48 hr after Mitomycin C administration. In spite of morphological changes produced by Mitomycin C, there was no indication of liver function impairment.

4710 THE EFFECT OF CORTISOL ON THE BINDING OF ACTINOMYCIN D TO AND ON THE TEMPLATE ACTIVITY OF ISOLATED RAT LIVER CHROMATIN. *(E.)* Beato, M. (Phillips Physiol. Chem. Inst., U. Marburg, Lahnberge, Germany), K. H. Seifart and C. E. Sekeris. *Arch Biochem Biophys* 138(1):272-284, 1970.

The effects of cortisol on the binding of actinomycin D to isolated rat liver chromatin was studied *in vitro* and the change in the capacity of the chromatin to support RNA synthesis following the action of cortisol was investigated. The binding capacity of chromatin for actinomycin D was measured by the use of tritium-labeled actinomycin and centrifugation through sucrose density gradients. The capacity of rat liver chromatin to bind ^{3}H-actinomycin D and to support RNA synthesis was increased by 40% and 10% resp., when compared to purified rat liver DNA. Spectroscopic optical titration of rat liver DNA (500 μg) with actinomycin D showed a saturation level of 44.2 μg of actinomycin D (49 moles/1,000 base pairs), while titration of rat liver chromatin with actinomycin D showed a saturation level of 10.6 μg of actinomycin D (12 moles/1,000 base pairs). These values suggest that in native chromatin the binding of RNA polymerase is restricted to a greater extent than is the smaller molecule antibiotic which binds to the smaller, less specific unmasked regions of the DNA. Incubation of the chromatin with cortisol phosphate for 10 min at 37°C resulted in a 10% increase in its ability to bind the antibiotic and a 15% increase in its capacity to act as a template for RNA polymerase. Chromatin incubated in only Tris-Cl buffer bound 9,950 ± 315 dpm/A_{260} of ^{3}H actinomycin, and had a template capacity of 2,500 ± 150 cpm/0.1 ml but when cortisol phosphate was added to the incubation medium, chromatin was able to bind 11,050 ± 420 dpm/A_{260} of actinomucin D, and the RNA template capacity was increased to 2,880 ± 150 cpm/0.1 ml. The effect of cortisol phosphate was dose-dependent between concentrations of 10^{-6} and 10^{-5}M.

4711 THE EFFECT OF COLCHICINE ON GUINEA PIG INTESTINAL ENZYME ACTIVITY. *(E.)* Cohen, M. I. (Montefiore Hosp. Med. Ctr., Bronx, N.Y.) and H. McNamara. *Amer J Dig Dis* 15(3):247-250, 1970.

Mucosal homogenates were prepared from scrapings of jejunum from adult male Hartley guinea pigs injected i.p. with sterile saline (9 controls) or 0.5 mg/kg body weight colchicine. Sucrase activity (micromoles substrate hydrolyzed per min per g of tissue) of the control group was 4.96 and of the colchicine group was 2.57. Maltase activity of the control group was 19.70, and in the colchicine treated group was 12.67. There was no significant difference between the control and colchicine groups with regard to gamma glutamyl transpeptidase activity. This significant fall in disaccharidase activity without alteration in the peptidase activity after colchicine administration suggests a specific response of the disaccharidase system rather than a generalized toxic mucosal effect of colchicine.

4712 FACTORS INFLUENCING THE ISOLATION OF A POLYRIBOSOMAL SYSTEM FROM RAT LIVER AND ITS ABILITY TO INCORPORATE [^{14}C] AMINO ACIDS. *(E.)* Huston, R. L. (US Army Med. Res. Nutri. Lab.), L. E. Schrader, G. R. Honold, G. R. Beecher, W. K. Cooper and H. E. Sauberlich. *Biochim Biophys Acta* 209(1): 220-239, 1970.

The optimal conditions for isolating and assaying the amino acid incorporation systems *in vitro* in rat-liver polyribosomes are described. Male Holtzman rats were fasted for 12 hr to deplete liver glycogen, and then were decapitated, and the livers removed and minced with 2 parts (w/v) of cold buffer for isolation of either cell sap or polyribosomes. The buffer medium (containing 250 mM sucrose, 50 mM HEPES, 250 mM KCl, 3.75 mM MgCl$_2$, 3 mM glutathione and adjusted to pH 7.3 with 25 mM KOH for equilibration of Sephadex G-10 columns) was optimal for preparation of post-mitochondrial supernatant for isolation of cell sap. The medium for isolation of polyribosomes was identical except that 5 mM MgCl was used and the pH was 7.6 (37°) after addition of glutathione. When the concentration of Mg^{2+} in the extraction and assay media was varied from 0 to 15 mM, maximal incorporation occurred at the 5 mM level, and the optimal ionic concentration of the buffers for isolation of cell sap enzymes, polyribosomes and the incubation system *in vitro* were 3.75, 5.00, 5.00-5.25 mM Mg^{2+}, resp. When the buffers contained 75 mM K$^+$, the incorporation of amino acids was 3-fold greater than when the system was isolated and assayed in 25 mM K$^+$ buffer. Glutathione in the extraction media enhanced the rate of amino acid incorporation and no additional thiol source was required in the incubation medium. The addition of the detergent deoxycholate (1.67% of post-mitochondrial supernatent) gave optimal preparation of total liver polyribosomes. The RNA/protein ratio increased from approximately 0.80 to 0.92 over a range of deoxycholate concentrations from 0.33 to 1.67% (w/v). Gel filtration of cell sap with Sephadex G-10 yielded the most active preparation for protein synthesis *in vitro*. Incorporation of [^{14}C] amino acid into polyribosomal protein was measured at 7103 disintegrations/min using Sephadex G-10 as compared to 4370 disintegrations/min with Sephadex G-25 and 5035 disintegrations/min with Bio-Gel P-4. Incorporation of amino acids *in vitro* was linear for only 2 min at 37° when 45 μg of cell sap protein was used per μg of polyribosomal protein; however, a ratio of 22.5 μg cell sap protein per μg saturated the assay system.

4713 INTESTINAL MUCOSAL MORPHOLOGY DURING WATER AND ELECTROLYTE ABSORPTION: A LIGHT AND ELECTRON MICROSCOPIC STUDY. *(E.)* Dobbins, W. O., III (VA Hosp., Washington, D. C.) and J. T. Tomasini. *Amer J Dig Dis* 15(3):226-238, 1970.

A series of male Osborne-Mendel rats was used for light and electron microscopic studies of *in vivo* preparations of rat ileum fixed during well-defined conditions of water and electrolyte absorption. Water absorption was significantly greater in saline-perfused animals than in mannitol perfused animals (0.19 ± 0.012 ml/cm/hr and 0.04 ± 0.015 ml/cm/hr, resp.). The structural alterations consisted of dilation of the epithelial cell intercellular spaces and dilation of the capillaries and lymphatics in the lamina propria. The dilated intercellular spaces were localized in the apical one-third of the villus. The separation between the lateral membranes started at the supranuclear level, increased gradually to become maximal at the level of the basal end of the nucleus, and was then reduced sharply by basal lateral processes of the epithelial cell which extended along the basement membrane, leaving a 200 to 400 Å gap between them without a specialized junctional structure. The lymphatic dilatation was readily evident and quite convincing even before quantitation and the increase in capillary luminal area was also clear, but required quantitation for confirmation. A heavy precipitate was observed in the brush border localized to the surface coat of microvilli and to the outer leaflet of the plasma membrane, which gave evidence of ATPase localization; a mild precipitate was also observed along the apical half of the lateral cell membrane of epithelial cells, localized to the outside of the cell in close contact with the outer leaflet of the cell membrane, and distributed in clumps rather than diffusely.

4754 DIRECT ASSESSMENT OF THE IMPORTANCE OF CONJUGATION FOR BILIARY TRANSPORT OF SULFOBROMOPHTHALEIN SODIUM. *(E.)*

Whelan, G. (U. Texas Southwestern Med. Sch., Dallas), J. Hoch and B. Combes. *J Lab Clin Med* 75(4):542-557, 1970.

The importance of the conjugation step for optimal transfer of BSP from blood into bile was examined directly by comparison of the biliary excretion of dye when either free or conjugated BSP was administered i.v. to mature Sprague-Dawley rats and Maxwell guinea pigs. Conjugated BSP was prepared *in vivo* by harvesting the BSP-glutathione conjugate from paper chromatograms of bile collected from rats receiving a constant infusion of BSP, and by *in vitro* synthesis and isolation in a pure form. In guinea pigs injected with free BSP at a dose of 12 μmole per 100 g, a maximal dye excretion rate of 0.85 ± 0.24 μmoles/100 g/10 min was achieved, while synthetic conjugated BSP at the same dosage produced an excretion rate of 1.63 ± 0.35 μmoles/100 g/10 min. Maximal rates of biliary excretion of dye in rats were measured at 1.24 ± 0.20 μmoles/100 g/10 min when free BSP (12 μmoles/100 g) was given, and at 3.17 μmoles/100 g/10 min when conjugated BSP was given. In both animal species there was a slower initial rate of uptake of the conjugated dye. In the guinea pig with patent bile ducts, the hepatic content of dye at 2 min after injection of free BSP averaged 0.28 μmole per g of liver, compared with 0.10 μmole per g of liver when conjugated BSP was administered. In the rat, hepatic dye content at 2.5, 5.5 and 10.5 min after injection of free BSP averaged 0.30, 0.51 and 0.88 μmoles per g of liver, and was 0.13, 0.19 and 0.26 μmoles per g of liver when conjugated BSP was given. The conjugation *in vivo* apparently is the rate limiting step in the overall transport of injected free BSP from blood to bile.

4755 DUODENAL FERRITIN SYNTHESIS DURING IRON ABSORPTION IN THE IRON-DEFICIENT RAT. *(E.)*

Brittin, G. M. (U. Texas D. M. Anderson Hosp. Tumor Inst., Houston) and D. Raval. *J Lab Clin Med* 75(5): 811-817, 1970.

The incorporation of ^{14}C-DL-leucine into ferritin (isolated immunologically from duodenal homogenates) was measured in normal and iron-deficient rats before and 1, 3 and 5 hr after intraduodenal administration of iron (1 mg). The homogenates from iron-deficient animals contained hardly any ferritin (less than 2.0 μg/g gut) compared to the controls (18.6) but 5 hr after the iron administration the level increased to the base-line level of the controls (17.5) and both the deficient and control animals exhibited roughly the same net increases. The iron deficient rats had more incorporation of ^{14}C-DL-leucine (39.8 cpm/g gut), higher ^{14}C specific activity (2.1 cpm/μg protein), and higher iron absorption (26.6% of administered dose) compared to the controls (34.3, 1.11 and 1.8, resp.). When a second dose of iron was given 5 hr after the first dose, duodenal ferritin doubled in 3 hr (12.4 to 25.5) while radioiron absorption decreased (25 to 14%). Pretreatment with iron (0.25 mg i.v.) decreased absorption (25 to 20.5%) but did not affect ferritin content or radioiron incorporation. Ferritin does not seem to be important in the regulation of iron absorption.

4756 SMALL BOWEL ABSORPTION IN HYPOPHYSECTOMIZED RATS. *(E.)*

Levitan, R. (VA Westside Hosp., Chicago, Ill.) and A. Righetti. *Amer J Dig Dis* 15(3): 218-225, 1970.

An *in vivo* perfusion technique was used to measure sodium, chloride, water, and glucose absorption from an isotonic test solution from the entire small bowel (ligament of Treitz to the ileocecal valve) in normal, sham-operated, and hypophysectomized male albino Charles River rats, 5, 10, 15, and 21 days after operation. There was no difference between normal and sham-operated rats (200.62 and 189.58 mg/hr for glucose) but the hypophysectomized rats showed a 50% decrease in all 4 substances (106.35 mg/hr after 5 days for glucose). In all experiments (operated and normal rats) mean chloride absorption was greater than that of sodium. Sodium flux into and out of the intestinal lumen measured by using ^{24}Na was lower by approximately 44% in 5 hypophysectomized rats than in 7 control rats 15 days after operation. The mean and dry intestinal weights were 33% lower in the hypophysectomized rats than in normals; there were no differences between normal and sham-operated rats. The mucosal DNA measurements showed no significant difference between normal and sham-operated rats but statistically significant differences occurred between control and hypophysectomized rats. A hormonal deficiency, not only a decrease in surface area, seemingly is responsible for the observed decreased absorption in hypophysectomized rats.

4757 ABSORPTION AND EXCRETION OF AN ORAL DOSE OF TRITIATED VITAMIN K_1 IN MAN. *(E.)*

Shearer, M. J. (Guy's Hosp. Med. Sch., London, England), P. Barkhan and G. R. Webster. *Brit J Haemat* 18(3):297-308, 1970.

The absorption of Vitamin K_1 from the gastrointestinal tract into the blood and its excretion in the urine and feces was measured (by lipid extraction and chromatography) in two normal men after administration of an oral dose of tritiated vitamin K_1 (50-100 μC). Radioactivity in the plasma was detected within 30 min, and in lipid-soluble phase it reached a peak of 5000 d.p.m. per 100 ml plasma and then declined rapidly to less than 1300 d.p.m. within 12 hr; a low level of activity of less than 100 d.p.m. persisted for 96 hr. Thin-layer chromatography studies showed that over 92% of the total radioactivity was due to lipid-soluble Vitamin K_1, and the remaining plasma radioactivity was due to water-soluble material. Ultracentrifugation of serum at the time of peak absorption showed that 65.3% of the radioactivity could be floated to the top of the centrifuge (in a medium of density 1.21), and appeared in the void volume on gel filtration through Sephadex G-200. Fecal excretion of radioactivity was maximal in the first 2 days, and was complete after 5 days. During the first five days in both subjects a total of 49.5% and 54.7%, resp., of the ingested dose was present in the lipid phase, and only 2.7% and 1.9% was present in the aqueous phase. At least half of the ingested dose of labeled

Vitamin K_1 was absorbed. Excretion of radioactivity in the urine was greatest in the first 24 hr and from 8% to 19% of the dose of labeled Vitamin K_1 was recovered from the urine after 3 days.

4758 TRANSPERITONEAL EXCHANGE: V. NET WATER SHIFT ASSOCIATED WITH THE EXCHANGE OF SOLUTES BETWEEN BLOOD AND INTRAPERITONEAL 5% GLUCOSE SOLUTION. *(E.)* Aune, S. (Ulleval Hosp., Oslo, Norway). *Scand J Gastroent* 5(4):253-260, 1970.

The transperitoneal exchange of solute and water between the plasma and hyperosmolar peritoneal compartment content (induced by i.p. administration of a 5% glucose solution) was studied in rabbits. In 5 experimental rabbits, 100 ml of 5% glucose solution was given i.v., peritoneal samples were collected every 5-15 min and blood samples were collected every 20-50 min for up to 4 hr. In 3 rabbits, following 5% glucose injection, the total i.p. fluid was drained repeatedly and the time course of fluid influx was evaluated. Normal serum concentration of Na was 144 mEq/l (range: 136-150) and osmolarity was 311 mOsm/l (range: 309-314), while for peritoneal fluid, Na concentration was 144 mEq/l (range: 140-147) and osmolarity was 308 mOsm/l (range: 304-313). Peritoneal instillation of the slightly hypotonic (278 mOsm/l) 5% glucose was followed by an increased peritoneal osmolarity, exceeding serum by 20-30 mOsm/l in the course of 25-100 min. There was a concomitant net water influx from plasma into the peritoneal compartment. In one animal, 103 ml of water was transferred from the circulation into the peritoneal cavity at 0.45 ml/min on the average. Of this, 0.15 ml/min represented normal hydrodynamic production of peritoneal fluid and 0.30 ml/min was due to osmosis. Peritoneal fluid volume had increased maximally by 130 ml about 25 min after instillation of glucose, and osmolarity had increased by 30 mOsm/l at this time. The present experiments failed to demonstrate a solvent drag effect by osmosis.

4759 WATER MOVEMENT ACROSS THE CECAL WALL OF THE GERMFREE RAT. *(E.)* Loeschke, K. (U. Kentucky Coll. Med., Lexington) and H. A. Gordon. *Proc Soc Exp Biol Med* 133(4):1217-1222, 1970.

Water transport across the cecal walls was compared *in vivo* in germfree and conventional male Fischer 344 and Charles River rats. Following introduction of isotonic saline into cecal sacs (eventually ligated and placed back into abdominal cavity), absorption of fluid in germfree rats was significantly larger than conventional rats; germfree rats absorbed 20 times as much as the controls, the fluid uptake in both groups being essentially independent of volume initially present in the sac (germfree rats, mean fluid transport at 3 hr was 8.4 ± 1.2 ml and in conventional rats, 0.4 ± ml). Little change in osmotic permeability of the cecal walls of both groups was observed. In germfree and conventional rats, osmolarity of perfusion fluids in hypo- and hypertonic conditions showed a graded increase and decrease resp. Plasma osmolarity changed little during hypotonic perfusion (initial 308 ± 3 to final 311 ± 3 and 320 ± 10 mOsm/kg in germfree and conventional animals, resp.) and increased slightly in hypertonic studies (initial 308 ± 3 to 331 ± 10 and 324 ± 11 mOsm/kg in germfree and conventional animals, resp.). Osmotic water permeability was not significantly different between both groups of rats. Retention of water in cecal lumen of intact germfree rats seemingly is due to presence of osmotically active substances to which cecal mucosa is impermeable; sodium-coupled water transport appears to be increased as a compensatory mechanism.

4760 THE EFFECT OF ADENOSINE TRIPHOSPHATE ON THE TRANSMURAL POTENTIAL IN RAT SMALL INTESTINE. *(E.)* Kohn, P. G. (Dept. Physiol. Med. Res., U. Sheffield, England), H. Newey and D. H. Smyth. *J Physiol* 208(1):203-220, 1970.

The *in vivo* and *in vitro* effects of ATP on the transmural potential in the small and large intestine were studied in female albino Sheffield rats. *In vitro*, ATP in either the mucosal or serosal fluid caused a transient increase in the potential difference and short-circuit current across the wall of the jejunum, ileum and colon, with the serosal solution becoming more positive (*in vivo* preparations of small intestine yielded similar results). Although the response was relatively specific for ATP, the rapid hydrolysis of extracellular ATP could not explain the transient nature of the response. The response was inhibited by high concentrations of K^+ in the mucosal medium, serosal ouabain or mucosal 2,4-dinitrophenol without altering the time course while no significant inhibition occurred in the presence of ADP or in Mg^{2+}-free saline solutions. Theophylline (2 mM) in the mucosal medium caused the time to reach the peak increase to be doubled and the decay to be slightly slower. The presence of hexoses in the mucosal fluid (concentrations of either 2 mM or 28 mM) inhibited the ATP potential except for galactose at low concentrations, and when hexoses were present in the serosal fluid (at 222 mM), only fructose inhibited the potential to a significantly greater extent than the osmotic control (mannitol).

4761 EXPERIMENTAL OBSERVATIONS AND MATHEMATICAL CONSIDERATIONS ON THE MECHANISM OF TRANSPORT OF URIC ACID ACROSS HUMAN GASTRIC MUCOSA. *(E.)* Mertz, D. P. (Med. Polyclin. U. Frieburg, Germany). *Pfluger Arch* 316(2):132-139, 1970.

The mechanism involved in the transport of uric acid across the gastric mucosa was studied in 38 adult subjects (31 men, 7 women, 18- to 44-yr-old) in whom quantitative collections of gastric secretion and acid output were made following i.v. histalog stimulation (either 50 mg/hr or 2 mg/kg/hr). Gastric uric acid concentration declined as a hyperbolic function with increasing acidity and this decrease in uric acid concentration was compensated by a simultaneous stimulation of the gastric secretory volume rate. The gastric secretory rate of uric acid was found individually to be largely constant; collective uric acid secretion was independent of the gastric acid output. In both normal and hyperuricemic conditions, the concentration ratio of uric acid between gastric juice and plasma was 0.2-0.4. A gastric transport of uric acid by nonionic diffusion seemingly exists in human gastric mucosa.

4762 EXCRETORY PHYSIOLOGY OF STEROIDAL HORMONES IN LIVER. *(E.)* Despopoulos, A. (Sch. Med., New Mexico, Albuquerque). *J Pharmacol Exp Ther* 173(1):43-47, 1970.

The excretion of steroidal hormones (estradiol, progesterone, testosterone, methyltestosterone and cortisone) by isolated perfused rat livers was studied following single doses (20 μm) and continuous infusions (100 μm) of ^{14}C labeled steroids (in the 4-carbon position). Isotope concentrations in the perfusion fluid fell rapidly with a half-time of approximately 2 min and with 90% disappearance in 8 min and 100% in 15 to 20 min. The appearance of the isotope in the bile was delayed with 90% completion only after 50 min and all the excreted material was shown (thin layer chromatography) to be more polar than the original injected materials. Following continuous infusion, radioisotope concentrations in the perfusion fluid remained constant as well as the rates of bile flow, biliary excretion of the isotopes and their concentrations in the bile. The ratio of bile isotope concentration to perfusion fluid isotope concentration was 1000, indicating the effective concentrating mechanism. Probenecid (0.5 mM) decreased the rate of excretion, the concentration and the bile flow by 45%, 36% and 10%, resp., suggesting a role of the steroid metabolites in hepatic transport of organic anions.

4763 INCREASE OF THE UTILIZATION OF ^{59}Fe BY THE SIMULTANEOUS INGESTION OF THIS ELEMENT WITH LACTOSE OR WITH MANNITOL. *(Fr.)* Bouvet, D. (no affil). *C R Acad Sci* 270(9):1264-1267, 1970.

The effect of lactose and mannitol on iron utilization was studied in 16 Wistar rats divided into groups that received a normal diet with 2 mC ^{59}Fe and 0.3 mg iron sulfate, with or without calciferol (10 IU) and with or without lactose (400 mg) or mannitol (400 mg). Lactose caused a doubling in iron retention in red blood cells (5.87 vs 3.66), spleen (1.73 vs 1.07), and liver (0.81 vs 0.44). Pretreatment with calciferol did not affect the action of lactose. Mannitol evoked an increase in iron retention after 24 hours in the spleen and liver; after 72 hours the red blood cells increased in Fe content at the expense of splenic iron which showed a marked decrease.

4764 EFFECT OF CHOLECYSTOJEJUNOSTOMY, ROUX-Y, ON INTESTINAL ABSORPTION OF LABELED FAT, LABELED PROTEIN AND XYLOSE. *(E.)* Shin, C. S. (Methodist Hosp., Brooklyn, N. Y.) and I. F. Enquist. *Bull Soc Int Chir* 29(1):21-27, 1970.

The effect of cholecystojejunostomy, Roux-Y on the intestinal absorption of carbohydrate, fat and protein was studied in healthy mongrel dogs of both sexes using xylose, ^{131}I-labeled triolein, and ^{131}I-labeled human serum albumin, resp. Postoperative studies showed minimal alterations in protein and carbohydrate absorption, and little change in fat absorption for the first 4 hr after ingestion; however, late specimens (6 hr) in the animals with the Roux-Y reconstructions were significantly lower than they were preoperatively. Serum alkaline phosphatase and serum bilirubin were not affected by the operation.

4765 TRANSPERITONEAL EXCHANGE: IV. THE EFFECT OF TRANSPERITONEAL FLUID TRANSPORT ON THE TRANSFER OF SOLUTES. *(E.)* Aune, S. (Ulleval Hosp., Oslo, Norway). *Scand J Gastroent* 5(4):241-252, 1970.

The effect of a concurrent fluid flow on the transperitoneal transport of solutes was studied in rabbits using two experimental methods. In the first method, the disappearance of urea, PAH, inulin and serum albumin from the peritoneal cavity was compared to previously established transport of these substances from the blood capillaries into the peritoneal compartment. Test compounds were administered in a radioactive solution (5000 counts/min/ml) of RISA, and rates of absorption were determined by measuring scintillation count changes at 20 minute observation periods. On an average, urea and PAH-absorption rates from the peritoneal compartment were 2.46 and 1.02 ml/min, resp., and transperitoneal plasma clearances of the same substances through the peritoneal membrane were 2.75 and 1.38 ml/min (the differences in absorption may be due to solvent drag). The second method recorded changes in the transperitoneal plasma clearance of solvent fluid shifts due to osmotic gradients between blood and peritoneal solution. Osmotic water movement in or out of the peritoneal compartment was induced by varying the osmolarity of the peritoneal solution and varied the exchange of urea, inulin, PAH and RISA proportional to the diffusibility of the solutes. Urea clearance (net fluid flow = 0) was calculated as 2.44 ml/min, PAH-clearance was 1.38 ml/min, inulin clearance was 0.38 ml/min and serum albumin clearance (RISA) was 0.07 ml/min. Osmosis had no direct dragging influence on solute transport.

4766 INFLUENCE OF BLOOD SUPPLY ON LIPID UPTAKE FROM MICELLAR SOLUTIONS BY THE RAT SMALL INTESTINE. *(E.)* Sylven, C. (Chem. Ctr., U. Lund, Sweden). *Biochim Biophys Acta* 203(3):365-375, 1970.

White male rats were used to study lipid absorption and the specificity mechanism of sterol absorption in preparations representing a gradual transition from conditions *in vitro* to *in vivo*. Different micellar solutions containing radioactive sterols (cholesterol, sitosterol), octadecane or oleic acid and monoolein were used to study uptake into small intestine slices *in vitro*; these solutions were also injected *in situ* into rat jejunal segments which had been tied off at either end during intact and interrupted blood supply. The uptake of the different lipids in jejunal segments with an intact blood supply varied between 8 and 30% thirty min after administration; octadecane had the most rapid rate of uptake followed by oleic acid, monoolein and cholesterol, resp. The rate of sitosterol uptake was approximately one third that of cholesterol. The uptake in jejunal segments with an interrupted blood supply decreased to 1.5 to 4.5% for all species of lipid; after 5 min there was no net uptake with time. Sitosterol uptake was one-seventh that of cholesterol in jejunal segments with an interrupted blood supply. Lipid uptake decreased when a micellar solution containing KCN was injected into a jejunal segment with an intact blood supply (similar to that produced by exclusion of the blood supply). In contrast to the low uptake by segments with an interrupted blood supply, the uptake of radioactive sterols by preparations *in vitro* increased markedly with time and sitosterol was taken up to the same extent as cholesterol. Intestinal lipid absorption apparently cannot be investigated by conventional methods *in vitro* since the penetration of lipid from micelle to mucosa epithelial cell seemingly is an active process.

MOTILITY

4786 THE RELATIONSHIP BETWEEN OXYGEN CONSUMPTION AND THE FREQUENCY OF ELECTRICAL SLOW WAVE ACTIVITY IN THE ILEUM AND DISTAL COLON OF THE RABBIT DURING EXPERIMENTAL HYPOTHYROIDISM. *(Fr.)* Couturier, D. (Fac. Med. Paris, France), C. Roze, M. H. Couturier-Turpin and C. Debray. *J Physiologie* 61(6): 461-474, 1970.

The relationship between oxygen consumption and electrical slow wave activity in the ileum and distal colon was studied in 24 rabbits, 12 of which were made hypothyroid either chemically (^{131}I) or surgically. The mean values of O_2 consumption were 15.92 ml/min in controls, 15.47 in ^{131}I-treated animals, and 11.28 in surgically treated animals (i.e. 373, 316 and 256 μl/hr/g, resp.). Histological examination of the thyroids revealed radionecrotic lesions in all ^{131}I-treated rabbits. In the distal colon of normal controls slow waves were recorded during 6% of the total time of recording with a frequency of 14.4 c/min, while in hypothyroid animals slow waves occurred 4.7% of the time with a frequency of 11.8 c/min. The mean frequency of slow waves in the ileum was 15.9 c/min in controls and 14.6 c/min in treated animals. A correlation between the frequency of electrical slow waves in the ileum and the oxygen consumption was found, and this relation seemingly holds true for the entire small intestine.

4787 THE EFFECTS OF THE FOUR MAJOR ANTIBIOTICS ON THE MOTILITY OF THE ISOLATED RABBIT JEJUNUM. *(E.)* Guiti, N. (Dept. Exp. Med. Pharmacol., U. Teheran, Iran) and M. H. Kermani. *Chemotherapy* 15(2):65-69, 1970.

The effects of penicillin G (2.4 x 10^{-8} to 9.6 x 10^{-5} g/ml), streptomycin (4 x 10^{-8} to 2 x 10^{-3} g/ml). chloramphenicol (4 x 10^{-8} to 2 x 10^{-3} g/ml) and oxytetracycline (4 x 10^{-8} to 6 x 10^{-4} g/ml) on the motility of the rabbit isolated jejunum were studied *in vitro*. Either epinephrine (8 x 10^{-8} g/ml) or isoproternal (4 x 10^{-8} g/ml) were used as comparison drugs, and several other alpha and beta adrenergic agents (phentolamine, propanalol) and cholinergic agents (eserine) were added to challenge the antibiotics. Penicillin within the dose-range used did not alter the spontaneous motor activity of the isolated jejunum. Streptomycin produced a 30% reduction in gut motility at dose of 1 x 10^{-4} g/ml, and produced complete relaxation at a dose of 2 x 10^{-3} g/ml. Phentolamine and eserine did not block the antimotility effect of 2 x 10^{-3} streptomycin. Oxytetracycline had a minimal(22%) antimotility effect at a dose of 1 x 10^{-4} g/ml, and produced complete relaxation at a dose of 6 x 10^{-4} g/ml. Chloramphenicol reduced the amplitude of contraction of the isolated jejunum by 20% at 1.6 x 10^{-3} g/ml and produced 100% relaxation at a dose of 1 x 10^{-2} g/ml. $BaCl_2$ (1.2 x 10^{-4} g/ml) blocked by 53% the antimotility effect of a dose of 6 x 10^{-4} g/ml oxytetracycline and by 75% the maximal antimotility effect of chloramphenicol. Antibiotics appear to act upon a nonspecific receptor in the rabbit jejunum which is independent of the autonomous neuromuscular junctions.

4788 CHOLINERGIC MECHANISM FOR INTESTINAL HYPERMOTILITY CAUSED BY ARTERIAL OCCLUSION. *(E.)* Yamamoto, M. (Tohoku U. Sch. Med., Sendai, Japan), N. Taira and K. Hashimoto. *Jap J Physiol* 20(1): 145-153, 1970.

The mechanism for alteration of intestinal motility induced by occlusion of the superior mesenteric artery was studied in 16 unanesthetized spinal dogs. Intestinal motility and tone was increased in 23 of 32 observations during arterial occlusion and in 24 of 32 observations immediately after the release of occlusion which was maintained for 3 min. Arterial occlusion lasting for 30 sec produced no change in motility or tone, while that for 60 sec increased motility and tone with a 30 sec latency. Neither further prolongation of the period of occlusion nor bilateral vagotomy influenced the pattern of response. Tetrodotoxin (20 μg) and atropine (100 μg) abolished the intestinal response to arterial occlusion as well as to contractions produced by 1,1-dimethyl-4-phenylpiperazinium iodide (DMPP). Phenobarbital (3 to 10 mg) greatly reduced the intestinal responses to arterial occlusion and to 30 μg of DMPP, but the response to acetylcholine (30 μg) was unchanged after phenobarbital administration. Physostigmine (10 μg) markedly potentiated while hexamethonium (1 to 10 mg) had no effect on the intestinal response to arterial occlusion. The release of acetylcholine through excitation of the intramural cholinergic neurons due to hypoxia or the CO_2 increase during arterial occlusion is seemingly responsible for the increased intestinal motility.

4789 ELECTRICAL ACTIVITY OF THE CANINE ESOPHAGUS AND GASTROESOPHAGEAL SPHINCTER: ITS RELATION TO INTRALUMINAL PRESSURE AND MOVEMENT OF MATERIAL. *(E.)* Arimori, M. (Mayo Grad. Sch. Med., U. Minnesota, Rochester), C. F. Code, J. F. Schlegel and R. E. Sturm. *Amer J Dig Dis* 15(3):191-208, 1970.

In 10 intact dogs and 3 dogs with bilateral subhilar vagotomy, myogenic electrical activity of the sphincter and adjacent esophagus and stomach was measured by the chronic implantation of bipolar silver/silver chloride electrodes. At rest, the only electrical activity detected in the body of the esophagus was of cardiac origin. With deglutition, a burst of oscillating changes in electrical potential began in the orad esophagus, and then swept caudad along the esophagus. The frequency of the action potentials was 150-170 cycles/sec and the duration of the bursts was 2.5-7.0 sec in the lower esophagus and uniformly close to 2 sec in the cervical esophagus. The action potentials in the esophagus were synchronous with the peristaltic contractions detected in the lumen. The gastroesophageal sphincter and the adjacent gastric fundus exhibited continuous phasic activity, which was reduced in the sphincter with relaxation, and in the fundus with distention of the esophagus or stomach and during anesthesia. In the orad segment of the sphincter, the inhibition of phasic activity was followed after swallowing by sphincteric action potentials which were related to sphincteric contraction, while in the caudad segment, only the inhibition of phasic activity and its return occurred. Esophageal distention caused inhibition of action potentials in the esophagus distal to the distention as well as inhibition of the sphincteric continuous phasic activity which continued until the distention was terminated. After subhilar vagotomy, intraluminal pressures and myogenic action potentials were simultaneous and of lesser magnitude in the vagotomized segment of the esophagus. Vagotomy reduced the incidence of response to swallowing by about 50% but it did not alter the motor action of the gastroesophageal sphincter.

4790 EFFECTS OF MICROBIAL CONTAMINATION OF THE CECUM ENLARGEMENT OF GERMFREE RATS. *(E.)* Gustafsson, B. E. (Karolinska Inst., Stockholm, Sweden), T. Midtvedt and K. Strandberg. *Scand J Gastroent* 5(4):309-314, 1970.

The effects of microbial contamination on the cecum enlargement and on motility in response to acetylcholine and serotonin were studied in germfree rats (384-455 days old) contaminated with *Clostridium difficile* or with fecal suspension from conventional rats. After contamination with *Cl. difficile* cecum contents (g%) were reduced during the first week and then increased (0.3) for the remaining 15 weeks of the investigation; after contamination with a fecal suspension from conventional rats, cecum contents dropped to the normal level (0.05) within a week and remained there. Cecum wall weight (g%) dropped in both groups (approximately 0.02) but did not reach the normal level (0.15), water content of the cecum increased insignificantly during the first week for both groups and then was the same as that of conventional rats (82%), and water content of the cecum wall never varied (75 to 80%) in both groups. The low muscular activity of the germfree cecum in response to acetylcholine and serotonin was not affected by contamination and other smooth muscle organs of the germfree rats (duodenum, ileum, colon and uterus) did not exhibit low muscular sensitivity (although similar studies run with younger rats 21-24 days old indicated that the cecum muscular sensitivity of the germfree cecum after contamination resembled that of the conventional rat). Cecum wall sensitivity to other smooth muscle stimulants (with different modes of action) and to barium and potassium chloride reflected a parallelism irrespective of microbial status with variable responses.

4791 MOTOR ACTIVITY *IN VITRO* OF SMALL INTESTINE FOLLOWING WHOLE-BODY X-IRRADIATION. *(E.)* Kagnoff, M. F. (Boston U. Med. Ctr., U. Hosp., Mass.). *Radiat Res* 42(3):565-576, 1970.

The contractions of small intestinal segments (duodenum, jejunum, ileum) from adult Sprague-Dawley rats were studed *in vitro* for up to 30 days following exposure of the rats to whole body radiation. Sham-irradiated rats served as controls. Jejunal segments of sham-irradiated rats exhibited an irregular contraction pattern with intermittant brief regular periods. There was a significant increase in contraction regularity 2 and 3 days after 700 R (60% regularity), 1500 R (88% regularity) and 100 R (58% regularity), compared with 25 R (30% regularity) and sham irradiation (30% regularity). Also exposures with 1500 R and 700 R increased contraction amplitude to 0.12 mm and 0.07 mm, resp., compared with a sham-irradiated amplitude of 0.05 mm. Segments of proximal duodenum showed an increase in regularity to 46% (compared with a sham-irradiated duodenal value of 16.7% regularity) 2 and 3 days following a dose of 1500 R. Ileal segments showed no significant increase in irregularity. Also the gradient of contraction frequency (duodenum > jejunum > ileum) was maintained, but the gradient for contraction regularity (ileum > jejunum > duodenum) was abolished following whole body exposure of rats to doses of 1500 R.

4792 EFFECT OF HETERONIUM BROMIDE ON GASTRIC ACID SECRETION AFTER HISTAMINE AND ON GASTRIC EMPTYING MEASURED BY RADIO-VIATMIN B_{12} AS AN INDICATOR. *(E.)* Bennett, R. (New York Med. Coll., New York) and G. B. Jerzy Glass. *Amer J Gastroent* 53(4):330-338, 1970.

The effect of graded doses of heteronium bromide on gastric output stimulated by augmented histamine test and on gastric emptying (as measured by the radioactive-Vitamin B_{12} marker technique) were determined in 18 patients with miscellaneous gastrointestinal disorders. Following the administration of heteronium bromide (total dose 6.4-9.6 mg) one and two hr prior to histamine, total output of acid and gastric juice were reduced as a function of dose of heteronium bromide with little change in acid concentration of the juice. Heteronium bormide in doses of 4.8, 6.4, or 8.0 mg reduced the mean volume of the standard (psyllium) meal emptied from the stomach in 11 of the 12 patients from 264 ml (control) to 137, 152 and 147 ml, resp., when given 2 to 2½ hr prior to the meal. Statistical analysis of the differences between the mean gastric juice volume emptied for any dose of heteronium bromide (1.6 to 8.0 mg) and no drug controls (83.0 mg) proved them to be significantly different ($p < 0.001$). Secretory volume was decreased from 160 ml/min to 46, 40 and 68 ml/min, resp., for the aforementioned doses.

4793 ANALYSIS OF THE SITE OF NICOTINE ACTION ON GASTRIC ANTRAL AND DUODENAL CONTRACTILE ACTIVITY. *(E.)* Bass, P. (Parke Davis Co. Res. Lab., Ann Arbor, Mich.), G. M. Carlson, B. W. Ruddon, C. C. Hug, Jr. and S. K. Schmiege. *J Pharmacol Exp Ther* 172(2):377-383, 1970.

An analysis of the site of nicotine action on gastric antral and duodenal contractile activity was conducted in 102 anesthetized mongrel dogs with acutely implanted extraluminal strain gauge force transducers. Close intra-arterial infusions of nicotine, 5-25 µg/kg/min, produced initial variable stimulation followed by inhibition of contractile activity of both gastric antrum and duodenum. Nicotine-induced spontaneous contractile activity in 5 anesthetized dogs was completely abolished by intra-arterial injection of 10 µg of tetrodotoxin. I.V. administration of nicotine, 100 µg/kg produced initial inhibition of contractile activity followed by stimulation. Inhibition produced by i.v. nicotine was decreased by adrenalectomy (38%), vagotomy combined with splanchnicotomy (26%) and vagotomy combined with spinal anesthesia (49%). Secondary stimulation of contractile activity induced by i.v. nicotine was abolished by adrenalectomy. Inhibition of contractile activity by i.v. nicotine was attributed to activation of adrenergic systems. Adrenergic mediators released by nicotine seemingly act on neuronal elements rather than directly on smooth muscle since nicotine inhibited vagal-stimulated but not metacholine-induced contractile activity.

4794 EFFECT OF THE C-TERMINAL OCTAPEPTIDE OF CHOLECYSTOKININ ON GUINEA PIG ILEUM AND GALL-BLADDER *IN VITRO. (E.)* Hedner, P. (U. Hosp. Lund, Sweden). *Acta Physiol Scand* 78(2):232-235, 1970.

The effects of C-terminal octapeptide of cholecystokinin were studied in guinea pig ileum and gallbladder *in vivo*. Octapeptide regularly produced a submaximal gallbladder contraction at 0.5 ng/ml and comparable responses were obtained by cholecystokinin, 0.015 units/ml, and by pentagastrin, 1 µg/ml. Octapeptide responses were resistant to acetylcholine and tetrodotoxin. The lowest effective dose of octapeptide that produced contraction in the longitudinal muscles of ileum was 0.5 ng/ml. The contractile response with 2 µg/ml of pentagastrin was similar to that induced by 1 ng/ml of octapeptide. Both responses were reduced slightly (20%) or not at all by hexamethonium (16 µg/ml) and were completely inhibited by tetrodotoxin (0.4 µg/ml), which did not affect the response to acetylcholine (0.02 µg/ml). Atropine (0.08 µg/ml) completely blocked responses to acetylcholine, cholecystokinin, pentagastrin and to octapeptide. In circular muscles, propagated contractions were obtained by increasing intraluminal volume, by acetylcholine (0.01 µg/ml), by octapeptide (down to 0.1 ng/ml) and by cholecystokinin (down to 0.003 units/ml); hexamethonium (8 µg/ml) inhibited response to increased intraluminal volume, to acetylcholine and sometimes to lowest effective doses of octapeptide and cholecystokinin but not to higher doses (over 1.0 ng/ml and 0.03 units/ml resp). Overall molar activity of octapeptide was comparable to caerulein and about 3 times that of cholecystokinin and 1000 times that of pentagastrin. C-terminal octapeptide of cholecystokinin seemingly is the most active gallbladder contracting agent known at present with molar activity 100 times that of acetylcholine, histamine or bradykinin.

4795 THE ACTION OF ANGIOTENSIN ON THE HUMAN COLON *IN VITRO. (E.)* Fishlock, D. J. (London Hosp. Med. Coll., England) and A. Gunn. *Brit J Pharmacol* 39(1):34-39, 1970.

The action of angiotensin *in vitro* on longitudinal and circular muscle strips was studied using specimens dissected from the distal half of the human colon and mounted in a 10 ml bath containing Krebs solution (37°) gassed with 95% O_2 and 5% CO_2. The muscle preparations were treated with acetylcholine, angiotensin II, atropine sulfate (10 µg/ml), hexamethonium bromide (20 µg/ml), lidoflazine (500 ng/ml) and procaine HCl (50 µg/ml), and the response contractions were recorded with an isotonic direct-writing lever on a smoked drum. Because angiotensin caused prolonged tachyphylaxis, the intervals between additions of angiotensin were 50-60 min, and frequent washouts were interspersed. All longitudinal and circular muscle strips contracted in response to acetylcholine and angiotensin. The ED50 value (g/ml) for acetylcholine was 1.6×10^{-6} in circular muscle and 1.1×10^{-6} for longitudinal muscle, and for angiotensin were 8.7×10^{-8} and 3.1×10^{-8}, resp. Although angiotensin caused a sustained contraction due to prolonged tachyphylaxis, there was no cross tachyphylaxis between angiotensin and acetylcholine. Procaine and hexamethonium had no effect on the responses of the smooth muscle to either agonist while exposure to atropine sulfate reduced responses of muscle to acetylcholine (ED50 $= 6.17 \times 10^{-6}$) but had no effect on responses to angiotensin. A concentration of 50 ng/ml of lidoflazine applied for 90 min did not affect response to acetylcholine or angiotensin but above this dose, lidoflazine reduced smooth muscle responses to both agonists, but there was no significant difference between the antagonist effects on the actions of angiotensin and acetylcholine.

4796 A METHOD OF RECORDING THE GASTRIC ELECTRICAL ACTIVITY IN MAN. *(E.)* Monges, H. (Hosp. Nord, Marseilles, France) and J. Salducci. *Amer J Dig Dis* 15(3):271-276, 1970.

Electrical activity in the gastric antrum of 40 healthy adults (28 men, 12 women) fasted for 12 hr and placed in a supine position was recorded with electrodes that were introduced p.o. into the gastric cavity and applied by suction to the mucosa. The electrical activity was recorded in a bipolar method with two stainless steel needle electrodes placed 2 mm apart in a rubber cup together with a pressure balloon placed near the cup. The electrodes were run into the rubber cup in order to lie transverse to the gastric longitudinal muscle layer. During the investigation the electrodes were positioned under fluoroscopic control and a catheter in communication with the cavity of the rubber cup was connected with a suction pump by which a negative pressure (-100 mg Hg) was applied to the cavity of the rubber cup. Electrical activity, pressure and respiration were simultaneously recorded on an 8-channel recording apparatus. Good recordings were made of the pacesetter potential and the fast spiking activities during the contractions.

4797 THE EFFECT OF PROSTAGLANDIN E_1 AND BRADYKININ ON NORMAL AND DEPOLARIZED ISOLATED DUODENUM OF THE RAT. *(E.)* Turker, R. K. (Fac. Med., U. Ankara, Turkey) and A. Ozer. *Agent Action* 1(3):124-127, 1970.

The relaxing effect of prostaglandin E_1 (PGE_1) and bradykinin on rat isolated normal and KCl-depolarized duodenum was studied and compared with that of isoprenaline. PGE_1, bradykinin and isoprenaline relaxed the rat isolated duodenum in normal Tyrode's solution; bradykinin and PGE_1 showed a linear dose-response relationship. The minimal effective concentration of bradykinin was 0.1 ng/ml, that of PGE_1 was 5 ng/ml and that of isoprenaline 2 ng/ml. PGE_1 and bradykinin produced a contraction and isoprenaline produced relaxation when the duodenum was depolarized by isotonic KCl-Tyrode's solution. No tachyphylaxis was observed with the contractile effect of PGE_1 and bradykinin. The relaxing effect of isoprenaline was diminished but not abolished when the duodenum was depolarized in calcium-free isotonic KCl-Tyrode's solution, while the contractile effect of bradykinin, but not that of PGE_1 in depolarized medium was dependent on calcium content of external medium. PGE_1, bradykinin, and KCl seemingly act on the pool of adrenergic neurons and produces a liberation of catecholamines. In addition to catecholamine release, KCl apparently causes depolarization of the cell membrane of smooth muscle.

SECRETION AND METABOLISM

Stomach

4805 THE EFFECT OF KININ HORMONES UPON GASTRIC SECRETION: III. ACTION OF SYNTHETIC ELEDOISIN. *(Ger.)* Mertz, D. P. (Med. Polyclin. U. Freiburg, Germany), W. Poppe and G. Poser. *Med Klin* 65(12):548-551, 1970.

The effect of synthetic eledoisin, as a peripheral vasodilator upon the gastric juice was studied during submaximal acid stimulation (50 mg Histalog/hr) in 12 fasting males by gastric biopsy, roentgenography or gastroscopy. Immediately following the start of a 10 min infusion of eledoisin (0.005-0.01 μg/min/kg, i.v.), there was a transitory, light but significant increase in volume rate, hydrogen, chloride and potassium ion concentration (14-22%), which decreased (with continuing eledoisin) in the next 20 min to initial values. During and following the discontinuation of eledoisin, magnesium ions and gastric juice decreased significantly. Because eledoisin did not increase mesenteric circulation, it evidently occupies a position between angiotensin and bradykinin. Blood circulation and secretory production of the gastric mucosa is decreased by angiotensin and increased by bradykinin.

4806 PEPTIDES OF NORMAL HUMAN GASTRIC JUICE. *(E.)* Heathcote, J. G. (U. Salford, England) and R. J. Washington. *Int J Protein Res* 2(2):117-126, 1970.

The isolation and characterization of gastric peptides was performed in pooled resting samples of normal human gastric juice. Samples contained a decapeptide of low chromatographic mobility. The sequential structure of the peptide was, Leu-Ala-Ala-Gly-Lys-Val-Glu-Asp-Ser-Asp and the approximate molecular weight ranged from 1000 to 1020 by various methods. Two of five gastric samples also contained a peptide of slightly higher Rf value in smaller quantities. The peptide was tentatively identified as a nonapeptide with alanine as the N-terminal amino acid. The acid composition was otherwise identical with that of decapeptide, N-terminal leucine being the only amino acid absent. These 2 peptides had not been previously reported to be present in normal human gastric juice; they were not observed in samples from pernicious anemia patients.

4807 INHIBITION OF THE PENTAGASTRIN-STIMULATED GASTRIC ACID SECRETION IN THE RAT BY ANTI-GASTRIN-LIKE SUBSTANCE. *(E.)* Varro, V. (U. Med. Sch., Szeged, Hungary) and J. Nafradi. *Scand J Gastroent* 5(4):273-275, 1970.

The inhibitory effects of 2-phenyl-(2-pyridil) thioacetamide (antigastrin) on the pentagastrin-stimulated (0.5 μg/100 g body weight i.v.) gastric acid secretion was studied by gastric perfusion of Wistar rats. When given 20 min before pentagastrin, antigastrin at doses of 1 to 35 mg/kg i.v. caused no inhibition while at doses of 40 to 100 mg/kg it caused total inhibition (partial inhibition was noted in 1 animal at 50 mg/kg and in 2 animals at 66 mg/kg), and the inhibition at the higher doses (70 to 100 mg/kg) lasted 180 to 270 min. Antigastrin given 10 min after the test dose of pentagastrin shortened the secretory response.

4818 COINDUCTION OF RAT LIVER BRANCHED CHAIN α-KETO ACID DEHYDROGENASE ACTIVITIES. *(E.)* Wohlheuter, R. M. (Dept. Biochem., U. Wisconsin, Madison) and A. E. Harper. *J Biol Chem* 245(9):2391-2401, 1970.

A branched chain α-keto acid dehydrogenase assay, using carboxyl-labeled keto acids, was used to measure the tissue and subcellular distribution of α-ketoisocaproate dehydrogenase activity in the rat, and the coinduction of the branched chain keto acid dehydrogenase activities of α-ketoisocaproic, α-ketoisovaleric and α-keto-β-methylvaleric acids by several amino acids and by increased dietary protein. Radioactive purity of the α-keto acids were checked by scanning paper chromatograms and α-keto acid dehydrogenase activities were estimated by measuring the $^{14}CO_2$ evolved during incubation with tissue preparations. The α-ketoisocaproic acid dehydrogenase was found almost exclusively in the liver (93% distribution of activity), while leucine-α-ketoglutarate amino-transferase was found predominantly in the kidney. In the liver, the α-ketoisocaproic, α-ketoisovaleric and α-keto-β-methylvaleric acid dehydrogenase-specific activities increased linearly and in constant proportion to each other as the protein content of the diet was increased from 0 to 30%. The average adjusted specific enzyme activity rose from a base level of 60 units at 0% casein in the diet to a maximum activity level of nearly 230 units when 30% casein was present in the diet (at higher concentrations of casein there was no further increase). The modulation of dehydrogenase activity appeared to result from the combined effects of a cycloheximide-sensitive mechanism which adapted to daily protein intake, and a cycloheximide-insensitive mechanism which involved a daily activation-deactivation cycle.

4819 EFFECT OF METHYLCOBALAMIN ON PROTEIN CONTENT IN LIVER AND SERUM OF PARTIALLY HEPATECTOMIZED RAT. *(E.)* Koizumi, T. (Osaka U. Med. Sch., Japan), T. Suematsu, K. Hiramatsu and H. Abe. *Experientia* 26(3):282-283, 1970.

The effect of methylcobalamin (20 µg/100 g/day, i.m.) on the serum and liver protein concentrations was determined in normal Sprague-Dawley rats, in rats with chronic hepatic damage (carbon tetrachloride inhalation) and in rats after partial hepatectomy, or healthy. Serum protein concentrations (g/l) were lower in the animals with liver damage (15) than in the normal controls (22) while liver protein concentrations (mg/g wet weight) were similar in the 2 groups (approximately 13). After partial hepatectomy, methylcobalamin showed no difference from untreated animals in serum or liver protein concentrations but after partial hepatectomy of rats with chronic hepatic damage, serum (21) and liver (17) protein concentrations were significantly higher than those of the control group (18 and 13, resp.). Methylcobalamin apparently increases protein synthesis and accelerates regeneration of the liver with chronic damage.

4820 PHOSPHOLIPID SYNTHESIS AND EXCHANGE IN ISOLATED LIVER CELLS. *(E.)* Jungalwala, F. B. (Agric. Res. Inst. Counc. Inst. Anim. Physiol., Cambridge, England) and R. M. C. Dawson. *Biochem J* 117(3):481-490, 1970.

Phospholipid synthesis and exchange was investigated in isolated liver cells of Wistar rats. $[^{32}P]$phosphate incorporated into phospholipids in liver cells was present in phosphatidic acid, to a smaller extent in phosphatidylinositol, and a lesser extent into nitrogen-containing phospholipids. Synthesis of nitrogen-containing phospholipids from $[^{32}\text{P}]$phosphate by whole cells was possible with addition of cell supernatant fraction to cell suspension during incubation. The supernatant fraction was incapable of synthesizing phospholipids on its own. After pulse-labeling with $[^{32}\text{P}]$phosphate both microsomal and mitochondrial phosphatidic acid showed a rapid fall in radioactivity within first 20 min and this fall in radioactivity and rise in that of mitochondrial phospholipids was interpreted as providing evidence of transfer of labeled phospholipid molecules from synthetic site (endoplasmic reticulum) to mitochondrial membranes in intact cells. Mitochondrial phosphatidylcholine, phosphatidylethanolamine and phosphatidylinositol formation seemingly occurs within the endoplasmic reticulum.

4821 THE EFFECT OF CYCLOHEXIMIDE ON RNA SYNTHESIS IN REGENERATING RAT LIVER.

(E.) Neal, G. E. (Marie Curie Mem. Found., Oxted, Surrey, England), M. Y. Ali-Khan and F. R. Mangan. *Biochim Biophys Acta* 209(1):257-259, 1970.

The effect of cycloheximide on RNA synthesis in regenerating rat liver was studied in male Sprague-Dawley rats. Cycloheximide (10 mg/100 g body wt, i.p.) reduced the *in vivo* level of incorporation of ^{3}H-leucine into hot (90°) 10% trichloroacetic acid-insoluble material to less than 10% of the control level of incorporation in both nuclear and cytoplasmic cell fractions. The effect of an *in vivo* injection of cycloheximide on the endogenous nuclear RNA polymerase activity, and on the nuclear template capacity of sham-operated and partially hepatectomized rats (measured *in vitro*), showed that the addition of 100 μg cycloheximide to the assay media had no effect, indicating that the inhibitor did not interfere with nucleotide polymerization. The enhanced nuclear template capacity, accompanied by increased sensitivity to cycloheximide *in vivo* developed (following partial hepatectomy) in chromatin already present in the cells within 6 hr, four hours before the onset of DNA synthesis.

4822 REDOX-DEPENDENT CONFORMATIONAL CHANGES OF RABBIT LIVER CYTOCHROME P-450.

(E.) Yong, F. C. (Dept. Chem., St. U. New York Albany), T. E. King, S. Oldham, M. R. Waterman and H. S. Mason. *Arch Biochem Biophys* 138(1):96-100, 1970.

The optical rotary density changes (induced by redox changes) of cytochrome P-450 from rabbit liver endoplasmic reticulum were measured as compared to corresponding conformational changes of cytochrome P-420. Cytochrome P-450 particles were prepared from livers of phenobarbital-treated rabbits and contained no other heme compound. The conversion of cytochrome P-450 to P-420 was carried out under anerobic conditions using a Thunberg-type cell and urea as converting agent. Optical rotary density changes were made with a Cary Model 60 spectropolarimeter programmed with fixed band width of 15 Å. The oxidized cytochrome P-450 showed a negative Cotton effect, with a minimum at 432.5 nm and a maximum at 410 nm. The inflexion point of the Cotton effect was close to the absorption maximum of oxidized cytochrome (418 nm) and the peak-trough was 124 x 10^3 degrees. The CO complex of the reduced cytochrome P-450 exhibited a Cotton effect with a negative low point at 465 nm and a positive peak at 447.5 nm, and an amplitude of 63 x 10^3 degrees. Reduction of dithionite abolished the Cotton effect completely. Treatment of P-450 particles with potassium iodide, cholate, PCMS or urea converted the cytochrome P-450 into cytochrome P-420, which in its oxidized, reduced, and reduced CO complex form exhibited no anomalous rotation in any form in the Soret region, and the entire dispersion curves were displaced toward levorotation.

4823 EFFECT OF ADRENALECTOMY ON THE RESPONSE OF RAT LIVER POLYRIBOSOMES TO WHOLE-BODY RADIATION.

(E.) Yatvin, M. B. (U. Wisconsin Med. Sch., Madison). *Experientia* 26(3):253-254, 1970.

The effect of bilateral adrenalectomy on the response of liver polyribosomes to whole body radiation (60 R/min with a 2000 ^{132}C source emitting 662 KeV gamma rays) was studied in male Badger rats. There was a marked shift in liver polyribosome species of intact rats 20 hr after whole-body gamma radiation, but no polyribosome response occurred in liver of adrenalectomized, irradiated rats, even when exposed to doses up to 10,800 R. The percentage ratio of heavy polyribosomes to total number of liver polyribosomes was 59.1 ± 3.6 in intact rats receiving 900 R of gamma radiation, compared with a preradiation ratio of 40.8 ± 2.1. Before irradiation, the percentage ratio in adrenalectomized rats was 41.7 ± 3.4, and was changed to only 40.8 ± 1.9 at 900 R and to 38.5 ± 2.8 at 10,800 R radiation level treatments. Twenty-four hr after administration of cortisone acetate (100 mg/kg) to adrenalectomized rats, the polyribosome distribution ratio shifted to a value of 65.7 ± 5.3, indicating that the failure to obtain a polyribosome response to the stress of radiation in adrenalectomized rats is a result of their inability to excrete adrenal corticoids.

4824 EFFECTS OF CORTISONE ON RIBOSOMAL RNA SYNTHESIS IN RAT LIVER.

(E.) Loeb, J. N. (Columbia U. Coll. Physicians Surgeons, New York, N. Y.) and E. M. Tolentino. *Endocrinology* 86(5): 1033-1040, 1970.

The effects of a single dose (12.5 mg i.p.) and repeated doses (5 mg/day for 15 days s.c.) of cortisone acetate on rat liver ribosomal RNA synthesis (isolated by sucrose density gradient) was studied. Two groups of fasted animals that had received single cortisone doses were given $^{32}PO_4$ (1 mC i.p.) and orotic acid -6-^{14}C (4.2 μC i.p.) resp. The greater apparent incorporation of phosphate (1640 cpm/A260 over the control value 361) compared to that of orotate (225 cpm/A260 over the control value 93) indicated that cortisone increases the specific activity of phosphate pools in the animals given $^{32}PO_4$ and that the effects of cortisone on the liver RNA content must be studied directly. Single cortisone doses increased both ribosomal and non-sedimentable RNA content (mg RNA/mg DNA) in both fed (3.70 to 4.62) and fasted rats (3.17 to 3.81) but repeated administration prevented increases in body weight and liver DNA, RNA, and protein.

4825 CATABOLISM OF HEME *IN VIVO*: COMPARISON OF THE SIMULTANEOUS PRODUCTION OF BILIRUBIN AND CARBON MONOXIDE.

(E.) Landaw, S. A. (U. California Med. Ctr., San Francisco), E. W. Callahan, Jr. and R. Schmid. *J Clin Invest* 49(5):914-925, 1970.

The quantitative relation between heme catabolism and formation of bilirubin and carbon monoxide was studied in untreated rats and Sprague-Dawley rats treated with phenobarbital or the porphyrogenic drug, allylisopropylacetamide. Quantitation of bilirubin-^{14}C and ^{14}CO was performed by use of a metabolic chamber permitting continuous bile and breath collection. After i.v. infusion of hematin-^{14}C, controls and phenobarbital-treated rats produced equimolar amounts of labeled bilirubin and CO (bilirubin recovery—controls, 49-61%, phenobarbital, 67%; CO recovery—controls, 48-59%, phenobarbital, 68%.). Equimolar amounts of labeled bilirubin and CO were observed after pulse-labeling with glycine-2-^{14}C; in phenobarbital-treated rats, both metabolites were formed at an increased rate compared to controls. Total ratio of the amount of isotope in bilirubin and CO was 1.01 and 1.02 in phenobarbital-treated animals. By contrast, allylisopropylacetamide treatment reduced fractional conversion of hematin-^{14}C to bilirubin and CO (ratio, 1.31 and 1.20). Recovery of labeled CO and bilirubin was less than controls, although total radioactivity in bile was comparable to untreated or phenobarbital-treated rats. Comparable results were obtained in allylisopropylacetamide-treated rats after glycine-2-^{14}C pulse labeling. Findings suggest that (1) in control and phenobarbital-treated rats, infused hematin and heme formed in liver are converted predominantly to bilirubin and CO (equimolar amounts) and only small amounts of hematin are degraded to other metabolites; (2) phenobarbital treatment results in proportional increase in bilirubin and CO formation (increased heme synthesis and degradation in liver); (3) treatment with allylisopropylacetamide shifts CO/bilirubin ratio in favor of gas, and enhances formation of nonbilirubin metabolites.

826 EFFECTS OF X-RADIATION ON AMINO ACID INCORPORATION INTO REGENERATING LIVER PROTEINS.

(E.) Ariyama, K. (Div. Biol. Med. Sci., Brown U., Providence, R. I.), N. Fausto, E. Tamvakopoulos and J. L. Van Lancker. *Radiat Res* 42(3):528-538, 1970.

The incorporation of ^{14}C-leucine and ^{14}C-lysine into nuclear and cytoplasmic proteins was investigated in irradiated and nonirradiated regenerating or normal Sprague-Dawley rat livers. X-irradiation interfered with incorporation of ^{14}C-lysine (but not with ^{14}C-leucine) into nuclear proteins of regenerating livers. X-irradiation also altered incorporation of ^{14}C-lysine into isolated nuclei obtained from regenerating liver of irradiated animals. Microsomes and ribosomes obtained from 24-hr regenerating livers of irradiated and nonirradiated rats were similar in contributing to the incorporation of ^{14}C-leucine or ^{14}C-lysine into protein in standard incubation mixture. A moderate degree of interference by irradiation was observed when incorporation of ^{14}C-lysine *in vitro* into nuclei from livers of irradiated rats were compared to incorporation into nuclei from nonirradiated rats. Nuclear RNA extracted from hot phenol from irradiated or nonirradiated regenerating liver, stimulated amino acid incorporation *in vitro* to the same degree whatever its source. Alteration in protein synthesis produced by X-irradiation seemingly is caused by a decrease in production of nuclear RNA and possibly, specific types of messenger RNA.

4827 EFFECTS OF THYROTOXICOSIS ON FOLATE COENZYMES AND RELATED ENZYMES IN RAT LIVER.

(E.) Pasquali, P. (Inst. Chem. Biol., Appl. Biol., U. Bologna, Italy), L. Landi, C. Bovina and M. Marchetti. *Endocrinology* 86(5):1163-1166, 1970.

The effects of thyroxine (500 μg/day s.c. for 10 days) on the distribution of folate derivatives and on the enzymic activities responsible for their synthesis were studied using rat liver homogenates. Concentrations of the derivatives (ng/g tissue) decreased from normal values (10-formyltetrahydrofolate 770 to 415, 5-methyltetrahydrofolate 4264 to 3464, 5-formyltetrahydrofolate 1643 to 1046, tetrahydrofolate 1100 to 650, and 5,10-methylenetetrahydrofolate 789 to 250). Tetrahydrofolate dehydrogenase activity decreased (3.22 nm dihydrofolate/min/mg protein) from the nontreated control (4.35), the enzymic activity converting folate to tetrahydrofolate decreased (0.82 nm tetrahydrofolate/40 min/mg protein) from the normal (1.17), serine hydroxymethyltransferase dropped (939 to 439 nm formate utilized/20 min/mg protein), formyltetrahydrofolate synthetase dropped (1216 to 545 nm 5,10-methylidynetetrahydrofolate/20 min/mg protein), and 5,10-methylenetetrahydrofolate dehydrogenase did not change significantly (262 to 312 nm 5,10-methylidynetetrahydrofolate/20 min/mg protein).

4828 THE METABOLISM OF NICOTINE AND COTININE BY A MOUSE LIVER PREPARATION.

(E.) Stalhandske, T. (Roy. Vetr. Coll., Stockholm, Sweden). *Acta Physiol Scand* 78(2):236-248, 1970.

The metabolism of nicotine and cotinine was studied in a 10,000X g fraction of mouse liver homogenate using ^{14}C-labeled compounds. Total metabolism of nicotine and cotinine measured were proportional to amount of protein added and linear with time up to at least 30 and 25 min of incubation resp. Optimal reaction velocity was approached at a nicotine concentration of 1.6 mM. During a radiochromatogram nicotine metabolism showed 5 separate radioactive metabolites; the chromatogram spots found had the same R_f values as reference substances cotinine (R_f = 0.52), γ-(3-pyridyl)-γ-oxo-N-methylbutyramide (R_f = 0.34) and hydroxycotinine (R_f = 0.21); three unidentified metabolites and ^{14}CO$_2$ were observed. The metabolism of nicotine was also found to be TPNH and O$_2$ dependent; the lack of O$_2$ during the experiment caused a significant decrease in amount of cotinine formation. The observed metabolites were also excreted in urine following i.p. nicotine administration. In cotinine metabolism studies, radiochromatograms showed 3 metabolites with R_f values corresponding to γ-(3-pyridyl)-γ-oxo-N-methylbutyramide and demethylcotinine (R_f = 0.34), hydroxycotinine (R_f = 0.22) and one unidentified metabolite. No formation of ^{14}CO$_2$ was observed.

Excreted urine collected for 4 hr contained 46% of radioactivity injected. A similar pattern of nicotine and cotinine metabolites observed in *in vitro* and *in vivo* experiments seemingly indicates that biotransformation of nicotine in the liver represents the major metabolic route *in vivo*.

4829 COMPARISONS BETWEEN NUCLEIC ACIDS, PROTEIN, ZINC, AND MANGANESE IN RAT LIVER: A RELATION BETWEEN ZINC AND RIBONUCLEIC ACID. *(E.)* Holt, A. B. (Johns Hopkins Hosp., Baltimore, Md.), E. D. Mellits and D. B. Cheek. *Pediat Res* 4(2):157-164, 1970.

The relations of total zinc, manganese, nucleic acids and protein were evaluated by regression analysis and analysis of covariance in the livers of control, calorie-restricted and hypophysectomized rats. Calorie-restricted rats had higher total RNA and protein for a given DNA value ($p < 0.001$) with an insignificant increase in total RNA for a given protein value while hypophysectomized rats had lower RNA relative to protein or DNA ($p < 0.001$) and a normal relation between protein and DNA. Calorie-restricted rats had normal zinc/RNA and zinc/protein values but zinc was high relative to DNA ($p < 0.001$) while hypophysectomized rats had normal zinc/RNA and zinc/DNA values and slightly higher values of zinc/protein ($p < 0.01$). Calorie-restricted rats had elevated manganese/DNA and manganese/protein values ($p < 0.001$) and manganese/RNA values ($p < 0.005$) while hypophysectomized rats had normal manganese/DNA and manganese/RNA levels and slightly reduced manganese/protein values ($p < 0.025$). A continuous relation between RNA and zinc in the livers of both the control and experimental animals was found suggesting that zinc is important in RNA synthesis and subsequent protein synthesis in mammalian tissues.

4830 REACTIVITY OF SOME TRANSITION METALS ON NUCLEAR PROTEIN BIOSYNTHESIS IN RAT LIVER. *(E.)* Weser, U. (Physiol. Chem. Inst., U. Tubingen, Germany) and J. Koolman. *Experientia* 26(3):246-247, 1970.

The reactivity of some transition metals (Mn^{++}, Fe^{3+}, Cr^{3+} and Hg^{++}) with nuclear protein biosynthesis was determined in an *in vitro* system using enzymatically active rat liver nuclei. After a 30 min incubation, Fe^{3+} and Mn^{++} incorporated 130 to 140% of the control value for ^{14}C-amino acids, Cr^{3+} incorporated more than 400%, and Hg^{++} incorporated only 30% (which is essentially an ice bath value indicating total inhibition of nuclear protein synthesis). Hg^{++} shows a tendency to react with sulphur and strongly inhibits nuclear protein biosynthesis while the other metals studied are preferably bound to oxygen and stimulate the ^{14}C-amino acid incorporation.

4831 EFFECT OF INHIBITORS OF PROTEIN SYNTHESIS ON DNA FORMATION IN LIVER. *(E.)* Brown, R. F. (Pittsburgh U. Sch. Med., Pa.), T. Umeda, S. I. Takai and I. Lieberman. *Biochim Biophys Acta* 209(1):49-53, 1970.

The effects of three inhibitors of protein synthesis (cycloheximide, sparsomycin, and pactamycin) were studied on the replication of liver DNA (measured by the incorporation of radioactive thymidine into nuclear DNA) in partially hepatectomized (removal of 70% of the liver) rats. Protein synthesis was measured by the incorporation of labeled leucine into liver protein. Cyclohexamide, sparsomycin and pactamycin all inhibited DNA replication in liver cells that were forming DNA, and over the wide ranges of the antibiotics tested *in vitro* (5 μg to 300 μg) DNA and protein synthesis were reduced to the same extent. Maximal inhibition (90%) of DNA and protein synthesis was achieved by cyclohexamide, sparsomycin and pactamycin at doses of 50 μg, 300 μg, and 75 μg, resp., and approximately 60% inhibition occurred at doses of 15 μg, 100 μg, and 30 μg. Inhibition of DNA replication was not due to reductions in the activities of the kinases that convert thymidine to thymidine triphosphopyridine nucleotide, nor to reductions of ribonuclease reductase. A level of injected cyclohexamide (2 mg/100 gm body weight) in the rat, that reduced DNA synthesis by 90%, had no effect on the conversion of thymidine to thymidine triphosphopyridine nucleotide or of cytidine to d-cytidine monophosphopyridine nucleotide. The antibiotic did not affect the synthesis of uridine triphosphopyridine nucleotide from orotate. When the incorporation of ^{14}C-labeled orotate into labeled liver DNA was measured (in a 7-min pulse period), the average count for the three control animals was 14,300 counts/min per g of wet liver while with three animals treated with antibiotic (2 mg/100 gm body weight) the comparable count was 12,200.

4832 THE EFFECT OF 3-AMINO-1,2,4-TRIAZOLE ON THE PHENOBARBITAL-INDUCED FORMATION OF HEPATIC MICROSOMAL MEMBRANES. *(E.)* Raisfeld, I. H. (New York U. Sch. Med., New York), P. Bacchin, F. Hutterer and F. Schaffner. *Molec Pharmacol* 6(3):231-239, 1970.

The structure (studied by electron microscopy) and chemistry (hydroxylase activity) of the hepatic endoplasmic reticulum were examined in male Sprague-Dawley rats after phenobarbital (50 mg/kg) and 3-amino-1,2,4-triazole (3 g/kg) administration (i.p.) alone or in combination to determine whether cytochrome P-450 biosynthesis induction affects microsomal membrane formation. Benzpyrene hydroxylase activity (μg/g liver) increased 3-fold over sodium chloride controls (183 to 530) after phenobarbital alone but did not change after aminotriazole alone or in combination with phenobarbital. Aniline hydroxylase activity (μm/g liver) increased 2.5-fold over the controls (1.01 to 2.64) after phenobarbital and 1.5-fold over the controls (1.01 to 1.58) after combined administration of phenobarbital and aminotriazole but did not change after the administration of aminotriazole alone. Cytochrome P-450 levels (nm/g liver) rose 5-fold (74 to 372) after phenobarbital and 2-fold (74 to 131) after phenobarbital plus aminotriazole while dropping to approximately 70% of control values (74 to 51) after aminotriazole alone. Structurally, phenobarbital produced proliferation of smooth endoplasmic reticulum, decreased glycogen content and did not affect mitochondria size while aminotriazole did not produce proliferation of endoplasmic reticulum or decrease glycogen content but produced mitochondria of varying size. Combined administration of phenobarbital and aminotriazole produced proliferation of endoplasmic reticulum (although less pronounced than with phenobarbital alone), varied mitochondrial size and a loss of glycogen. Levels of cytochrome P-450 and the lipoprotein portion of the endoplasmic reticulum membrane may be controlled separately.

4833 EXCRETION OF SULFOBROMOPHTHALEIN BY PERFUSED RAT LIVER AS INFLUENCED BY STEROIDAL HORMONES. *(E.)* Despopoulos, A. (Sch. Med. U. New Mexico, Albuquerque). *J Pharmacol Exp Ther* 173(1): 37-42, 1970.

Eight steroids and stilbestrol (0.1 mM in dimethyl sulfoxide) were studied for their effect on hepatobiliary excretion of BSP using the isolated perfused rat liver. Control values for bile flow (82 ml/10 min period), BSP concentration (131 µm/ml), and BSP excretion (102% of infused dose) were obtained using dimethyl sulfoxide (0.1 ml). Cortisone decreased BSP concentration (50) and excretion (53) and increased bile flow (117), norethandrolone, Norlutin and norethynodrel decreased BSP excretion (76, 75 and 75, resp.) and bile flow (72, 72 and 67, resp.) while maintaining BSP concentration (98, 90 and 120 resp.) at the control levels; testosterone, methyltestosterone, progesterone, estradiol and stilbestrol decreased bile flow (72, 43, 46, 60 and 27, resp.) while BSP excretion and concentrations dropped drastically and then returned to control levels. Oxygen consumption by liver slices was unaffected by any of the steroids at 0.1 mM concentrations.

4834 EFFECT OF CORTISOL *IN VIVO* ON AMINO ACID INCORPORATION INTO PROTEIN BY RAT LIVER RIBOSOMES *IN VITRO*. *(E.)* Omata, S. (Tottori U. Sch. Med., Japan) and S. Ichii. *Endocr Jap* 16(6):569-576, 1969.

Homogenized livers from male Wistar rats injected with cortisol (5 mg/100 mg i.p.) were used to study the changes in amino acid incorporation into protein *in vitro* by liver ribosomes. Immediately after hormone treatment, the polysome region in the postmitochondrial supernatant fractions was reduced and recovered to the control level 1 hr later. A significant increase in heavier polysomes with a concomitant decrease of the monomer peak was observed at 4 hr after hormonal treatment. The incorporation of ^{14}C-phenylalanine by ribosomes from control and hormone-treated rats in the presence of poly-uridylic acid was almost linear and proportional to the concentration of ribosomes in the incubation mixture while in the absence of poly-uridylic acid very little incorporation was noticed. Ribosomes from the livers of adrenalectomized and cortisol-treated rats showed a higher activity than those from adrenalectomized rats and preincubation of purified ribosomes in a complete amino acid incorporating system did not abolish the effect of cortisol treatment on the incorporating activity. Sedimentation profiles of purified polysomes derived from livers of cortisol-treated rats was essentially similar to that from control rats, although amount of polysomes per weight of the tissue was greater in the cortisol-treated rats.

4835 STUDY OF THE ACTION OF FOLIC ACID IN EXPERIMENTAL HEPATIC REGENERATION. *(Fr.)* Molimard, R. (Hosp. Paul Brousse, Villejuif, France) and M. Benozio. *Path Biol* 18(7-8):425-427, 1970.

The action of folic acid (25 mg i.p.) on liver regeneration, after 2/3 partial hepatectomy, in male rats (19 pairs, Wistar) was studied. Regeneration (5 days postoperatively) was not significantly increased (controls: 66.78%; treated: 76.99%) in the folic acid-treated rats. Various degrees of compensatory hypertrophy were found in 6 animals, which appears not to be due to the folic acid. Liver regeneration probably does not occur as a result of folic acid treatment.

4836 GLYCOGEN SYNTHESIS IN BIOTIN-DEFICIENT RAT LIVER. *(E.)* Patel, M. S. (Temple U. Sch. Med., Philadelphia, Pa.) and S. P. Mistry. *Proc Soc Exp Biol Med* 134(1):264-268, 1970.

The levels of synthesis of hepatic glycogen were studied in Sprague-Dawley rats during various stages of biotin deficiency induced by feeding the animals a basal diet containing 20% spray-dried egg white for 4 to 9 weeks. A control group of rats was cured of biotin deficiency after 7 weeks on the diet by injection of 100 g of biotin three times a week for 2 weeks. A glycogenic dose of labeled glucose-U-^{14}C was given intragastrically to animals fasted for 24 hr, and glycogen synthesis in the liver was measured after 3 hr (scintillation technique), at 6, 7 and 9 week intervals. Livers of biotin-deficient rats, at 6 weeks, contained significantly less glycogen (39 ± 6.2 mg/g) than control rat livers (54 ± 2.6 mg/g) when the animals were sacrificed during the day. There was no significant difference in rat liver glycogen (68 ± 4.7 mg/g for biotin-deficient livers; 65 ± 4.6 mg/g for control livers) when animals were sacrificed at night (6 P.M. to 6 A.M.). Overall, the deficient animals on the basal diet for 6 weeks were able to synthesize the same amount of hepatic glycogen as that by the controls. The decrease in glycogen synthesis observed during the day was the result of diurnal variation, possibly augmented by experimental stress.

4837 INHIBITION BY INSULIN OF VALINE TURNOVER IN LIVER: EVIDENCE FOR A GENERAL CONTROL OF PROTEOLYSIS. *(E.)* Mortimore, G. E. (Milton S. Hershey Med. Ctr., Hershey, Pennsylvania) and C. E. Mondon. *J Biol Chem* 245(9):2375-2383, 1970.

The mechanism of action of insulin in either promoting urea production or inhibiting proteolysis in liver was assessed by measuring the valine turnover between protein and free amino acid pools in the perfused livers of non-fasted male Osborne-Mendel strain rats. Proteolysis was assessed during perfusion of isolated livers from the turnover of free valine, measured after single pulse additions of L-valine-1-^{14}C to the perfusate and from the release of label from livers previously labeled *in vivo*, and then perfused with 15 mM unlabeled valine to minimize reincorporation. In control experiments, free valine showed an initial slow cumulative increase during perfusion followed by a rapid increase. At the start of perfusion the extracellular pool contained 2.5 μmoles of valine and in isolated livers the intracellular content of valine averaged 1.02 ± 0.10 μmoles per liver. After 90 min of perfusion, the extracellular pool showed a net increase of nearly 15 μmoles/liver of free valine, while the average intracellular valine content increased by only 1.5 μmoles free valine. The presence of insulin *in vitro* completely inhibited the spontaneous net increase in free valine and also inhibited release of label from previously labeled livers. When insulin was infused continuously into the medium at a rate of 2.4 μg per hour, the free valine concentration of the perfusate after 30 min of perfusion was 0.11 μmoles/ml and rose to only 0.18 μmoles/ml after 60 min of perfusion, while the untreated perfusate which was also nearly 0.11 μmoles/ml of free valine content at 30 min rose to a value of 0.35 μmoles/ml in 60 min. The inhibiting effect of insulin was sustained for periods of up to 180 min of perfusion and was estimated to represent 1.0% of total liver protein per hr.

4838 HEPATIC LIPID METABOLISM IN HYPOPHYSECTOMIZED AND GROWTH HORMONE-TREATED HYPOPHYSECTOMIZED RATS. *(E.)* Liberti, J. P. (Med. Coll. Virginia, Richmond), R. S. Navon, E. S. Longman and P. F. Jezyk. *Proc Soc Exp Biol Med* 133(4):1346-1350, 1970.

Hepatic lipid metabolism was studied in hypophysectomized and growth hormone-treated hypophysectomized Sprague-Dawley rats. Incorporation of glycerol into total lipids by liver slices from hypophysectomized rats decreased rapidly following hypophysectomy. Glycerol incorporation was 74% of normal value at 1 week postoperation, 46% at 2 weeks and remained diminished, from 32-43% at 3-8 weeks. The decrease in incorporation of glycerol into neutral lipid, cephalin, and lecithin fractions, but not acidic lipid was noted following hypophysectomy. Synthesis of acidic lipids was not significantly affected by hypophysectomy but labeling of other lipids, particularly triglycerides, was diminished. Daily administration of bovine growth hormone for 10 days to animals (4 weeks posthypophysectomy) resulted in 75% increase in total lipid synthesis. Incorporation of label into lecithin (78%) and cephalin (70%) fractions exhibited the greatest increase in lipid fractions studied during the first 5 days of bovine growth hormone treatment.

4839 EXPERIMENTS ON THE METYRAPONE REDUCING MICROSOMAL ENZYME SYSTEM. *(E.)* Kahl, G. F. (Pharmacol. Inst. U. Mainz, Germany). *Naunyn Schmiedeberg Arch Pharmakol* 266(1):61-74, 1970.

Metyrapone reduction was studied in the isolated perfused rat liver (male Sprague-Dawley) and in rat liver microsomes using chromatographic and ultraviolet-absorption spectra analysis. The microsomal metyrapone reductase which required NADPH as a cofactor and was active under aerobic conditons reduced metyrapone at the aliphatic keto group. Fifty-nine percent of the metyrapone was converted into reduced metyrapone within a 2-hr perfusion period as determined by redistribution processes and the reductive activity of the liver. Reduced metyrapone was not metabolized further by microsomal preparations. Little relative activity (6%) was found in the 105,000 x g-supernatant, but the 9,000 x g-supernatant showed a relative activity of 72%. The time course of the reduction was almost linear over an incubation period of 60 min, and the K_m for metyrapone was determined to be 1.39×10^{-3} M.

4840 MEASUREMENT OF ACUTE CHANGES IN LIVER FUNCTION AND BLOOD FLOW. *(E.)* Andersen, M. N. (E. J. Meyer Mem. Hosp., Buffalo, N. Y.) and K. Kuchiba. *Arch Surg* 100(5):541-545, 1970.

Closely-spaced, serial measurements of acute changes in liver function and blood flow were obtained in normal subjects by recording injected indocyanine green dye concentrations with an earpiece densitometer. A dose of 0.25 mg/kg of injected dye produced satisfactory clearance curves, although with present equipment optimal results occurred at 0.5 mg/kg. Up to 4 determinations were performed with indocyanine green injections at intervals of 10 min or longer without production of artifacts by "loading" of liver cells; loading occurred with injections given at 6-min intervals. When time between tests was lengthened to 20 min, at least 5 tests were performed before a loading effect developed. In studies on pigs, tests at 40 min intervals showed good reproducibility with 12 injections. Calculations of cardiac output were obtained from same dye curve thereby permitting measurement of hepatic function, hepatic blood flow, and cardiac output from a single study. No adverse effects (including skin discoloration) were observed with injections repeated up to 7 times during a 2-hr period. Highly consistent and reproducible results are seemingly achieved with this method and therefore it provides a useful tool for serial estimation of acute changes in liver function.

4841 THE KINETICS OF ^{32}P INCORPORATION INTO THE PHOSPHOLIPIDS OF HEPATIC ROUGH AND SMOOTH MICROSOMAL MEMBRANES OF MALE AND FEMALE RATS. *(E.)* Holtzman, J. L. (Natl. Cancer Inst., Natl. Inst. Hlth., Bethesda, Md.), T. E. Gram and J. R. Gillette. *Arch Biochem Biophys* 138(1):199-207, 1970.

The kinetics of ^{32}P incorporation into the phospholipid fractions of rough and smooth hepatic microsomal membranes were studied in the livers of male and female Sprague-Dawley rats. Rats were given 0.2 mC of ^{32}P in 0.9% NaCl via the caudal vein and were sacrificed at 10, 40, 120, 360 and 1440 min following injection. Livers were homogenized, rough and smooth microsomal fractions were prepared and radioactivity of supernatent solutions and successive homogenates were determined by scintillation technique. The disappearance of ^{32}P from the serum of male and female rats followed a biphasic curve with a short half-life ($t_{1/2}$) of 55 min in males and 40 min in females, and a long half-life of 960 min in males and 880 min in females. There was a rapid uptake activity into the soluble liver fraction ($t_{1/2}$ = 47 min in males and 59 min in females) and in both sexes the total smooth and rough microsomal fractions showed the same specific activities at each time interval. There were marked differences in the turnover rates of the three components: phosphatidylcholine plus phosphatidylserine, phosphatidylethanolamine, and sphingomyelin. The incorporation rate in male rats at 40 min into the phosphatidylethanolamine was 10 times the specific activity of any other component, and this component reached equilibration with inorganic phosphate at 360 min, while phosphatidylcholine was not equilibrated until 1440 min. In female rats the specific activities of phosphatidylethanolamine and sphingomyelin at 6 hr were lower in the smooth than in the rough membranes. At 6 hr, the rate constant for synthesis of total hepatic microsomal phospholipid phosphorus (soluble Pi as precursor) was 10.40 x 10^{-4}/min in males and 3.22 in females. *In vitro*, the microsomes from male rats incorporated 4.1 x 10^{-4}ng of P (min-ng phospholipid P) from γ-^{32}P-ATP (mainly into phosphatidylethanolamine) into rough membranes, and only 2.9 x 10^{-4} into smooth membranes.

4842 REDUCED BREAKDOWN *IN VIVO* OF LIVER MICROSOMAL RIBONUCLEIC ACID AND PROTEIN IN RATS TREATED WITH CORTISONE. *(E.)* Ottolenghi, C. (Inst. Gen. Physiol., U. Ferrara, Italy) and O. Barnabei. *Endocrinology* 86(5):949-954, 1970.

The effect of chronic cortisone treatment (5 mg/100 g body weight i.p.) on the breakdown *in vivo* of liver microsomal RNA (labeled with ^{14}C- of ^{3}H-orotic acid) and protein (labeled with ^{14}C arginine) was studied in adrenalectomized rats. The radioactivity in liver RNA labeled with a single dose (2 µc/100 g i.p.) of 6-^{14}C-orotic acid after daily cortisone decreased at a slower rate than in the controls (when radioactivity in the controls reached 50% of the initial values, the cortisone treated values still retained 75% of the peak radioactivity). When microsomal protein was labeled with L-arginine-guanido-^{14}C (12.5 µC/100 g i.p.) and microsomal RNA with ^{3}H-orotic acid (10 µC/100 g i.p.) the radioactivity of both microsomal protein and RNA decreased with the protein half-life of 6.8 days (control value, 4.0 days) and the RNA half-life of 7.4 to 8.4 days (control 4.7 to 4.9 days).

4843 THE KINETICS OF TRICARBOXYLATE ANION OXIDATION BY RAT LIVER MITOCHONDRIA IN RELATION TO THE AVAILABILITY OF L-MALATE. *(E.)* Robinson, B. H. (Dept. Biochem., U. Toronto, Ontario, Canada) and J. B. Chappell. *Biochim Biophys Acta* 205(2): 300-303, 1970.

The kinetics of tricarboxylate anion oxidation by rat liver mitochondria were studied using the Lineweaver-Burk and velocity versus substrate concentration plots. The K_a for L-malate was found to be independent of tricarboxylate anion concentration but V_{max} was dependent on the isocitrate concentration and the K_m for isocitrate was independent of L-malate concentration while V_{max} was dependent. K_m values obtained for citrate, cis-aconitate, and isocitrate were 90, 77 and 67, resp. The mitochondrial enzymes, assayed in the same proportions as they existed in the rat liver mitochondria (to assess permeability barrier factors), yielded a K_m of 90 for aconitate acting on citrate, 13 for the hydratase acting on cis-aconitate, 2.5 for NADP-isocitrate dehydrogenase acting on threo-D_s-isocitrate, and 280 for NAD-isocitrate dehydrogenase acting on threo-D_s-isocitrate. For citrate, the limitation imposed by aconitate hydratase is greater than that imposed by membrane permeability as long as L-malate is saturating but for cis-aconitate and isocitrate the membrane limits oxidation rates even in the presence of saturating L-malate.

4844 MENTHOL AND BILIRUBIN INHIBITION OF 4-METHYLUMBELLIFERONE GLUCUROCONJUGATION *IN VITRO* BY RAT AND HUMAN LIVER. *(Ger.)* Hohenwallner, W. (U. Child. Clin., Innsbruck, Austria). *Clin Chim Acta* 28(2):225-231, 1970.

The effect of menthol on glucuronyl transferase, in rat and human liver homogenates, was investigated to discover whether or not 4-methylumbelliferone conjugates both bilirubin and menthol. Normal glucuronyl transferase activity (units/mg protein) at 15 min and 30 min was 120.8 and 248.4, resp., in rat liver and 121.5 and 187.5, resp., in human liver. The activity (with the addition of increasing quantities of menthol or bilirubin) was evaluated at 15 and 30 min incubation time. A highly significant difference was found between the 2 test substances (both decreased glucuronyl transferase activity), and between the different concentrations, which applies to either species. Bilirubin was conjugated more than menthol. The metabolism of increasing doses, in terms of differences in time of incubation, was significantly different between species. The existence of a single enzyme which conjugates both bilirubin and menthol apparently exists.

4845 REGULATION OF GLUTAMATE PYRUVATE TRANSAMINASE IN THE AMPHIBIAN *(RANA HEXADACTYLA)* KIDNEY AND LIVER HOMOGENATES. *(E.)* Reddi, A. S. (Dept. Zool., Sri Venkateswara U., Tirupati, India) and K. S. Swami. *Experientia* 26(1):19-20, 1970.

Intestine

4863 STUDY OF THE OIL AND MICELLAR PHASES DURING FAT DIGESTION IN THE NORMAL CHILD. *(E.)* Ricour, C. (Hosp. Child. Dis., Paris, France) and J. Rey. *Rev Europ Etud Clin Biol* 15(3):287-293, 1970.

The distribution of fats between the oil and micellar phases and relative concentrations of triglycerides, diglycerides, monoglycerides, and free fatty acids were studied during fat digestion in 6 normal children. The average lipid content for the oil phase was 6.5 ± 4.8 mg/ml and for the micellar phase 2.8 ± 2.4 mg/ml of intestinal fluid. Percentage of lipids solubilized in micelles was between 5 and 85% and there was no correlation between this value and the total lipid concentration. The oil phase contained almost entirely triglycerides and diglycerides; Their percentages by weight were 30.9 ± 9.8 and 22.3 ± 5.0 resp., and their molar percentage was practically identical (15.4 ± 5.6 and 15.5 ± 4.8) and varied at the same rate (R = +0, 77) inversely to the proportion of micellar phase. The molar percentage of monoglycerides was constant (10.6 ± 4.3) as long as sufficient quantities of tri- and diglycerides in the total phase and micellar phase were not predominant; the percentage decreased to 0 when micellar phase increased to over 60%. Free fatty acid concentration increased in subsequent stages of digestion and varied between 51 and 78%. The micellar phase contained only traces of tri- and diglycerides while the monoglyceride and free fatty acid percentages by weight were 26.7 ± 8.3 and 68.8 ± 9.7, resp. The free fatty acid and monoglyceride proportion (3.0 ± 0.7) remained constant as long as some monoglyceride remained in the oil phase.

4864 EFFECT OF CORTISONE ON THE DEVELOPMENTAL PATTERN OF THE NEUTRAL AND THE ACID β-GALACTOSIDASE OF THE SMALL INTESTINE OF THE RAT. *(E.)* Koldovsky, O. (Stanford U. Med. Sch., Cal.) and P. Sunshine. *Biochem J* 117(3):467-471, 1970.

The effects of cortisone on the developmental pattern of neutral and acid-β-galactosidase were studied in the small intestine of postnatal Wistar rats. After birth (before milk consumption), acid β-galactosidase activity increased rapidly in the ileum, but decreased slightly in jejunum. On day 16 after birth, activity in ileum began to decrease and on day 22, low adult values were observed in small intestine. Activity of neutral β-galactosidase in both jejunum and ileum was greater in suckling period than in later life but between day 20 and 25 after birth, activity in both areas fell rapidly to reach adult values. In adult animals, neutral β-galactosidase activity in jejunum was slightly higher than in ileum while in 12- to 20-day-old rats, activity in both parts was essentially the same. In adult animals, jejunal activity exceeded ileal activity four- to five-fold. Cortisone (0.5, 2.0 or 5.0 mg/100g/day for 4 days) did not affect the activity of neutral or acid β-galactosidase in 60-day-old rats. Acid β-galactosidase activity was decreased after cortisone treatment in 8-, 12-, 16- and 18-day-old rats, with sensitivity to cortisone increasing with approach of weaning. Neutral β-galactosidase activity was increased after cortisone treatment in the ileum of 8-, 12-, 16- and 18-day-old rats but only in the jejunum of 8- and 12-day-old rats.

4871 EFFECT OF POTASSIUM CHLORIDE ON INTESTINAL BLOOD FLOW. *(E.)* Chou, C. (Dept. Physiol., Michigan St. U., East Lansing), J. M. Dabney, T. A. Baker, W. T. Chen and F. J. Haddy. *J Lab Clin Med* 75(5):729-741, 1970.

The effect of luminal placement of a dose of KCl on local intestinal blood flow was studied in mongrel dogs in which a loop of ileum or jejunum was exteriorized and divided so that blood flow from each segment was drained by a single vein. While venous outflow was measured for 60 to 70 min, various combinations of KCl (975 mg dose), hydrochlorothiazide-KCl, hydrochlorothiazide (Diuril), NaCl (1 g), and glass beads were placed into the 2 adjacent segments (experimental vs control) of the dog small bowel. Also, luminal pressure was monitored in closed segments of intestine containing aqueous solutions of KCl or polyethylene glycol. The placement of KCl in the gut lumen caused an initial rise in venous blood flow from a baseline level of 13.60 g/min to 17.50 g/min in 5 min, followed by a fall in blood flow to 6.45 g/min in 60 min. Similarly, hydrochlorothiazide-KCl caused an increase in venous blood from a baseline level of 6.54 g/min to 8.22 g/min in 5 min, followed by a decrease to 3.05 g/min at 60 min. Placement of KCl in the gut lumen cuased a progressive rise in potassium concentration of venous plasma from the segment from a baseline level of 3 mEq/L to 16 mEq/L in 70 min. Both KCl and hydrochlorothiazide-KCl increased tonic contractions of the segment and increased luminal pressure. Glass beads or tablets with hydrochlorothiazide (Diuril) had little effect on these parameters. Placement of sodium chloride in the lumen increased venous blood flow from a baseline level of 18 g/min to 28 g/min in less than 5 min, and the increased blood flow was maintained at a level of 22 g/min for at least 1 hr with no observed changes in the motility of the segment.

4872 THE INFLUENCE OF PVNO (POLYVINYLPYRIDINE-N-OXIDE) ON THE PHAGOCYTIC CAPACITY OF THE LIVER-RES. *(Ger.)* Leonhardt, L. (Med. Coll. Hannover, Germany). *Nuclearmedizin* 9(1):98-100, 1970.

The effect of polyvinylpyridine-N-oxide (1.25 mg/kg, daily for 7 days) upon the specific tissue activity of spleen/liver (%) was studied in 21 male rabbits. Blocking (measured as impulse rate/min/g tissue, 1 hr after ^{198}Au injection) of liver reticuloendothelial cells (as an expression of spleen/liver activity), seen between the 2nd and 24th hr after polyvinylpyridine-N-oxide administration was increased to 60%, gradually falling to near normal (15%) at the end of 7 days. The storage of polyvinylpyridine-N-oxide in reticuloendothelial cells did not correlate in duration with that of the suppression of phagocytic activity in the reticuloendothelial system, probably because of a renewal of phagocyte activity with the reactive proliferation of new reticuloendothelial cells, as evidenced by a diminished blockade of the RES tissue 2 or 3 days after the injection of polyvinylpyridine-N-oxide.

DIAGNOSTIC PROCEDURES

4887 DIAGNOSTIC VALUE OF ROUTINE LIVER SCANNING IN ECCHINOCOCCUS DISEASE OF THE LIVER: A COMPARISON OF SCINTIGRAPHIC AND SURGICAL FINDINGS IN 100 CONSECUTIVE CASES. *(E.)* Ikkos, D. (Evangelismos Hosp., Athens, Greece), S. Gonticas and P. Gatsou. *Nuclearmedizin* 9(1):5-16, 1970.

The findings from liver scanning in the diagnosis of the presence, number, size and location of cysts were compared to surgical findings in 100 adult patients operated upon for hydatid cysts of the liver. Diagnosis by scanning was accurate in 90 of these cases (66 completely and 24 relatively) and inaccurate in 10 (falsely positive in 1 and falsely negative in 9). Eight of the 10 inaccurate diagnoses occurred in cases with a single cyst suggesting that the chances for a flase scan diagnosis are higher in these cases. Correct diagnosis occurred in all 19 cases where the cysts were located in the left lobe while 8 out of the 67 cases with cysts in the right lobe were incorrectly diagnosed reflecting the thinness and anterior location of the left lobe.

4888 PREDICTABILITY AND STATUS OF GASTROSCINTIGRAPHY WITH TECHNETIUM 99m. *(Ger.)* Locher, J. (Distr. Hosp. Basel, Switzerland), R. Fridrich and G. Englehart. *Deutsch Med Wschr* 95(11):547-551, 1970.

A diagnostic gastric scanning technique with Technetium 99 (i.v. injection of 2 mC and scintigraphy) was compared with the usual methods of preoperative diagnosis (intubation, endoscopy, biopsy) in 134 gastric patients. Accuracy of scintigraphic diagnosis was referred to autopsy findings, and those of surgical intervention. In 58 cases, a tumor diagnosis by scintigram was found in 43% (histologically established), with a false positive found in 9% of 12 cases, and a false negative in 5% of 7 cases. Analysis of scintigraphic disparities with radiological examination revealed 14 of 32 cases correctly diagnosed by scanning, and only 8 by radiology; while in 10 cases both methods failed. A positive diagnosis by scanning was incorrect in 4% of cases of gastric carcinoma; tumors were overlooked in 2% of cases. As evidenced from 35 autopsy findings (with 26 carcinomas), scintigraphic scans diagnosed 31 correctly; while from surgical findings, 39 of 51 were correctly diagnosed. Although scanning is technically simple and not stressful to patients, it is probably inadequate for serial investigations but is of diagnostic value in detecting extent of malignant gastric carcinoma.

4889 RADIOISOTOPE SCANNING IN THE DIAGNOSIS OF LIVER ABSCESS. *(E.)* Pai, S. T. (Dept. Surg., U. Malaya, Kuala Lumpur, Malaysia) and Y. W. Bakk. *Amer J Surg* 119(3):330-333, 1970.

Radioisotope scanning of the liver was carried out in 29 of 72 confirmed cases of liver abscess, using 150 to 200 μc of radioactive colloidal gold (i.v. injection) and scanning by either Photo-Scanner or a Color-Scanner. Of the 29 cases of liver abscess, 17 were amebic, 10 pyogenic, and 2 mixed in etiology. In 25 of 29 cases (86.2%) liver scanning demonstrated a space-occupying lesion in the liver suggestive of an abscess while in the remaining four cases the diagnosis was missed because of negative findings in the scan (in one of these four cases the scan showed a characteristic cirrhosis pattern). Liver scanning showed abscess patterns in 14 (83.0%) of 17 patients with amebic abscess, in 10 (100%) of 10 patients with pyogenic abscess and in 1 (50%) of 2 patients with mixed etiology abscess. Patients who received liver scans had a shorter duration of hospitalization of 19.2 days and a lower operative mortality rate of 3.5%, than patients who did not receive liver scans, and whose average hospital confinement was 26.1 days and mortality rate was 9.3%. The most important advantage of liver scanning is determination of the exact number and location of abscesses, so that individual therapeutic decisions may be made.

4890 CYTOLOGY OF MALIGNANT LYMPHOMAS OF THE STOMACH. *(E.)* Prolla, J. C. (Dept. Med., U. Chicago, Ill.), S. Kobayashi and J. B. Kirsner. *Acta Cytol* 14(5):291-296, 1970.

In 42 cases with lymphomatous involvement of the stomach, adequate cytologic examinations were made in 39, and in 27 of the 42 patients (64%) a positive cytodiagnosis was achieved and the lymphomatous nature of the malignancy was identified correctly. In addition to increased lymphocytes, 3 main types of malignant cells were noted: lymphoid, reticulum, and Reed-Sternberg. It appears that diagnostic cytology by gastric washing and Papanicolaou staining can facilitate a positive diagnosis of malignant lymphoma in a fairly high number of cases but cannot distinguish between the histologic types of lymphoma. Among over 3,000 examinations performed on patients with benign conditions and with adenocarcinoma of the stomach, 2 errors were made: in one case of lymphoid hyperplasia (pseudo-lymphoma) the large number of lymphocytes (some of them immature-appearing) led to a false positive report; and in one case of anaplastic adenocarcinoma the presence of only small, single malignant cells was mistaken for lymphoma.

4891 TWO-STAGE SCINTISCANNING IN THE DIFFERENTIAL DIAGNOSIS OF VASCULARIZED AND NON-VASCULARIZED INTRAHEPATIC SPACE-OCCUPYING LESIONS. *(E.)* Lubin, E. (Tel Aviv U. Med. Sch., Israel), J. Laor, A. Shimeoni, Z. Lewitus, A. I. Pick, U. Kadish, M. Dintsman and I. Garti. *Nuclearmedizin* 9(1):17-24, 1970.

The effectiveness of 2-stage liver scanning in differentiating vascular and avascular space-occupying lesions was tested in 5 patients with intrahepatic lesions. When a space-occupying lesion was found in an initial scan using ^{198}Au colloid, ^{131}I Rose Bengal, ^{99m}Tc colloid or ^{113m}In, a second scan (using ^{113m}In (20 μC/kg i.v.) as the blood pool label) was performed. Diagnosis by this method was proven accurate by surgery and/or selective celiac angiography in 2 cases with highly vascularized lesions (hemoangioma), 1 case with slight vascularization (adenocarcinoma), and 2 cases with avascular lesions (liver cyst and amoebic abscess).

4892 EVIDENCE OF LIVER CHANGES WITH ULTRASONIC SCANNING PROCEDURES. *(Ger.)* Kratochwil, A. (2nd U. Women's Clin., Vienna, Austria), W. Waldhausl and F. Wewalka. *Wien Z Inn Med* 51(1):37-44, 1970.

Detection of liver disease (18 liver cirrhosis, 6 primary liver carcinoma, 8 liver metastases, 5 hepatic steatosis, 9 virus hepatitis, 1 congested liver, 1 Wilson's disease) by two-dimensional ultrasonography was investigated. Eighteen healthy subjects served as controls. Normal livers were sonorously homogenous (up to 64 db); increasing the frequency revealed some echo patterns, seen in diseased livers at lower frequencies. The normal liver reflects ultrasonic waver caused by the great vessels (hepatic porta). In 17/18 cirrhotics, echo complexes were diffuse and reflected parenchymal damage. With accompanying ascites involvement, a homogenous area between peritoneum and liver capsule was observed. Patterns found in primary liver carcinoma and liver metastases were comparable to cirrhosis. Homogenous patterns were found also in chronic hepatitis, hepatic steatosis, congestion and Wilson's disease. Liver carcinomas, 7/8 liver metastases and 1/9 virus hepatitis were detectable by ultrasonography. The method is recommended for its simple application without danger to the patient.

4893 SOME PROBLEMS OF THE ULTRASONIC DIAGNOSIS OF BILE STONES. *(E.)* Smoldas, J. (2nd Med. Clin., Palacky U., Olomouc, Czechoslovakia). *Digestion* 3(2):65-72, 1970.

Several modifications of the A-scanning ultrasonic method of diagnosing bile stones (the impulse reflection passage ultrasonic method using 2 transducers) were used to test specimens from 60 healthy patients, 70 patients with abnormal affected liver parenchyma and 946 suffering from cholelithiasis, and the results compared with radiological, surgical and histological findings. Ultrasonic exploration revealed the optimal operating frequency to be about 2 MH_z with a silent area at a frequency of 2.3 MH_z with no marked echoes in normal patients. Hepatic tumors, abscesses, and cirrhosis were found to produce echoes dispelled in a wider interface which did not correspond to the boundary of external biliary pathways, and adipose gallbladder walls, cholecystic abscesses and infiltration, or gallbladder tumors produced echoes which could not be differentiated from those of bile stones. Measurements made in 946 patients with bile stones were positive in 85.89% of the cases compared to 82.87% positive findings with x-ray; and ultrasonic diagnosis showed positive reflections in 87.64% of 162 patients found negative using x-ray. Positive reflections may only indicate the presence of a tissue locality of ordinary properties, and this locality need not be bile stones.

894 PSEUDOTUMOROUS RADIOGRAPHIC FINDINGS ON THE COLON. *(Ger.)* Mateev, B. (Inst. Cancer es., Berlin, Germany) and K. H. Rotte. *Radiol Diagn* 0(6):573-585, 1969.

he double contrast method of radiography was used to nvestigate 1060 patients (65.7% normal, 15.2 with arcinoma, 5.3% with polyps, 6.3% with diverticuli, 4.8% with colitis, 2.6% with pseudotumors) suspected of having intestinal carcinoma. Sites of pseudotumors included the sigmoid flexure, cecum, descending colon and transverse colon (19, 4, 3, 1, resp.). Chronic diverticulitis was accompanied (in 8%) by sigmoid pseudotumors, with compression of the intestinal lumen (intestinal stenosis may be the start of a tumorous process). Pseudotumors of the large intestine may be caused by extracolonic tumors or adhesions and diagnosed by palpation or radiography. Adhesions subsequent to inflammatory process or surgery are predominantly found in the cecum and are evident by signs of deformity. Differentiation of this from a carcinoma is possible with the double contrast method, for in carcinoma, infiltration of the wall is irregular, and growth in the lumen more well defined.

4895 RESULTS OF SIMULTANEOUS X-RAY EXAMINATION OF THE GALLBLADDER, STOMACH AND DUODENUM. *(Ger.)* Becker, C. (Radiol. Clin., Martin Luther U., Halle-Wittenberg, Germany), H. W. Becker and I. Schleiff. *Radiol Diagn* 10(6):557-563, 1969.

4976 RELATIONSHIP OF β-GLUCURONIDASE ACTIVITY IN GASTRIC JUICE TO THE HISTOLOGY OF THE GASTRIC MUCOSA. *(E.)* Russell, R. I. (Roy. Infirm., Glasgow, Scotland), R. MacAllister and R. Campbell. *Gastroenterology* 58(3):352-357, 1970.

Normal histology was found in 19, superficial gastritis in 5, and atrophic gastritis in 12, of 36 suitable gastric mucosa biopsy specimens from the fundus of the stomach obtained from 12 symptomless subjects, 9 patients with non-specific dyspepsia, 2 with duodenal ulcer, 1 each with malabsorption, normocytic anemia, and carcinoma of the colon; and 10 from patients with chronic iron deficiency anemia. Of the 10 patients with chronic iron deficiency anemia, 3 were found to have superficial gastritis and 7 atrophic gastritis. A significant increase of β-glucuronidase activity was found in the gastric juice of the group with atrophic gastritis and in the gastritis group as a whole. Increased levels of β-glucuronidase in the gastric juice in gastric carcinoma may be a reflection of the high incidence of associated histological gastritis or intestinal metaplasia, and high β-glucuronidase levels in patients with gastritis possibly may indicate those patients where gastric mucosa may be at risk of undergoing neoplastic change.

4977 ENZYME DISTRIBUTION AND HISTOLOGY OF THE GASTRIC MUCOSA. *(Ger.)* Kessler, F. (St. Med. Ctr., Munich, Germany) and O. Kunz. *Z Gastroent* 8(2):75-79, 1970.

The distribution of the indicator enzymes in microsomes, mitochondria, lysosomes and cell membrane structures in normal and pathological human gastric mucosa (obtained by suction biopsies) was investigated by electron microscopy. Mitochondrial succinic dehydrogenase activity in normal mucosa was found mostly in the parietal cells with only a slight amount of activity in the chief cells and mucous cells; glutamate dehydrogenase activity was not detected and LDH activity was concentrated mostly in the parietal cells. In the mucosa in chronic atrophic gastritis, an occasional decrease in enzyme activity in the parietal cells and loss of activity in the globular cells was seen. Lysosomal acid phosphatase and microsomal unspecific esterase activities were distributed equally in the chief cells and mucous cells where they were intensely positive in normal mucosa and decreased in pathological mucosa. ATPase and alkaline phosphatase activities were increased in the membranes and in capillary walls in normal mucosa and were increased in the capillaries in atrophic gastritis; ATPase activity in the interstitial tissues was increased due to a mesenchymal reaction in the mucosa in atrophic gastritis.

STOMACH AND DUODENUM

Peptic Ulcers

5019 PENTAGASTRIN AS A STIMULANT IN ROUTINE CLINICAL TESTING OF GASTRIC ACID SECRETION. *(E.)* Pedersen, S. A. (Odense County City Hosp., Denmark). *Digestion* 3(2):81-89, 1970.

The effect of the synthetic pentapeptide, pentagastrin, as a stimulant of gastric acid secretion for routine clinical testing was studied in 150 patients with duodenal, prepyloric or corpus ulcer, gastric cancer or X-ray negative gastric dyspepsia. Peak acid output (PAO; expressed in mEq H^+/hr) after stimulation with pentagastrin at 6 and 9 mg/kg s.c. was 33.4 and 33.6, resp., indicating that the lower concentration caused a maximal response. PAO after stimulation with histamine (40 mg/kg s.c.) was 34.7 compared to the effect of pentagastrin (6 mg/kg s.c.) of 36.0 (with 9.9% average deviation from the highest value in duplicate examinations). Only 3 patients experienced side effects (slight and of short duration) and did not affect the study.

5020 GASTRIC MUCOSAL ULCERATION FOLLOWING VASOACTIVE AGENTS: A NEW EXPERIMENTAL METHOD. *(E.)* Pfeiffer, C. J. (Presbyterian-U. Pennsylvania Med. Ctr., Philadelphia), S. Sethbhakdi and J. L. A. Roth. *Amer J Dig Dis* 15(3):261-270, 1970.

The comparative ulcerogenicity of vasoactive cathecholamines (epinephrine and norepinephrine) on the gastric glandular mucosa was studied in male Sprague-Dawley rats. Administration of the two catecholamine in pyloric-occluded rats consistently produced hemorrhagic lesions in the fundic portion of the glandular mucosa, along the greater curvature and sometimes along the entire fundic mucosa. Histological examination showed congestion, hemorrhage and varying degrees of necrosis and erosion of the superficial layer of the mucosa. The muscalaris mucosa remained intact but the submucosa generally became edematous. In the control group (given saline injections), no lesions developed but small fundic eruptions occasionally appeared in a control group that was treated with sham operation and epinephrine. In the catecholamine-treated groups, the area of fundic mucosa covered with lesions reached a maximum of 43% when the pre-epinephrine administration period was 4 hr and when the epinephrine administration time and dose level were kept constant. Increasing the epinephrine administration time from 1 to 2 hr failed to augment the appearance of lesions when the pre-epinephrine administration time was more than 3 hr. When the pre-epinephrine administration time was shorter, fundic ulceration and hemorrhage appeared more extensively with a longer epinephrine administration time. Vagotomy protected the rats from epinephrine-induced lesions. A magnesium-aluminum hydroxide antacid gel (Maalox) protected 61% of the experimental animals from the occurrence of gross lesions and reduced the experimentally-induced ulcers in the remaining 39% to a negligible size. Titratable acidity and volume output varied directly with the total time of the assay; titratable acidity output was inversely related to the total exposure time to epinephrine.

5021 THE ACTION OF α- AND β-RECEPTOR ANTAGONISTS UPON GASTRIC ULCERATION INDUCED IN THE RAT BY PHENYLEPHRINE HYDROCHLORIDE. *(Fr.)* Djahanguiri, B. (Fac. Med., U. Teheran, Iran) and A. Pousti. *Arch Int Pharmacodyn Ther* 184(1):121-123, 1970.

The effects of an α-receptor blocking agent (phentolamine) and a β-receptor blocking agent (MJ 1999) on phenylephrine hydrochloride induced gastric ulceration was studied in 70 white rats (35 males, 35 females) fasted for 24 hr before the initiation of the experiment. Rats injected with phenylephrine hydrochloride (33 mg/kg i.p.) exhibited a 60% incidence of gastric ulcer (no ulcers were observed in serum injected controls), and of the rats treated with phenylephrine hydrochloride (33 mg/kg) and MJ 1999 (10 mg/kg), 65% had gastric ulcers. Phenylephrine hydrochloride (33 mg/kg) and phentolamine (2 mg/kg) reduced the incidence of gastric ulcer to 15%.

SMALL INTESTINE

Malabsorption

5071 TOLBUTAMIDE AND STEATOSIS. STUDIES IN THE RAT. *(Fr.)* Barthe, J. (Inst. Pasteur, Lyon, France) and J. A. Grimaud. *Path Biol* 18(5-6): 255-259, 1970.

The effect of tolbutamide (5-50 mg/kg body weight) on the body weight, liver mass, total liver lipids and mortality rate was studied in Wistar rats fed a low-choline diet to produce steatorrhea. During the first 3 months, the mortality rate in tolbutamide treated rats was much higher than the untreated group (probably due to the gavage); between 3 months and 1 yr, the treated rats had a lower mortality rate (3/36) than the untreated (10/58); and after 1 yr the untreated animals had a lower mortality rate (5/57) than those treated with tolbutamide (14/36). Up to the 200th day, the tolbutamide-treated animals showed a greater weight gain than untreated controls (which were closer to the normal weight); but after the 300th day, the treated animal's weight increase was only 50 gm in 200 days, compared to 115 gm in 200 days for untreated controls. There was no significant difference in the hepatic mass between treated and untreated animals. Biochemical signs of fatty liver persisted in treated rats.

5072 ALTERATION OF COBALT ABSORPTION IN PORTAL CIRRHOSIS AND IDIOPATHIC HEMOCHROMATOSIS. *(E.)* Valberg, L. S. (Dept. Path., Queen's U., Kingston, Ontario, Canada), D. Olatunbosun, W. E. N. Corbett and J. Ludwig. *J Lab Clin Med* 75(5):754-762, 1970.

The absorption and body retention of p.o. inorganic cobalt or iron tagged with ^{57}Co and ^{59}Fe, resp., (20 μm $CoCl_2$ or $FeCl_3$ with 1 μC $FeCl_3$ or $CoCl_2$, resp.) were measured by the recovery of radioactivity in the urine of patients with either normal iron stores, iron depletion, fatty infiltration and liver degeneration with normal iron stores, cirrhosis with normal iron stores, cirrhosis with iron depletion, portal cirrhosis with iron overload, or idiopathic hemochromatosis. Control subjects with normal iron stores averaged 44% absorption of cobalt and 27% of iron and the patients with degenerated livers and with cirrhosis in combination with normal iron stores did not deviate from these norms (although 2 subjects with portacaval shunt showed an increase to 62% for cobalt absorption) while those with iron deficiency had higher absorption levels for both cobalt and iron (70% and 62%, resp.). Absorption for cobalt and iron increased for patients with cirrhosis and secondary iron overload (73% and 59%, resp.) and for patients with cirrhosis and iron overload of unknown occurrence (74% and 73%, resp.). Direct correlations were observed between the intestinal absorption of iron and cobalt in controls with normal iron and iron depletion and in patients with degenerated livers and portal cirrhosis, and between the percent of the cobalt test dose absorbed and the percent excreted in the urine in all the patients. Cobalt absorption was increased in idiopathic hemochromatosis and portal cirrhosis when complicated by iron deficiency or endogenous iron overload.

5073 ABSORPTION OF D-XYLOSE AND FAT AND HISTOLOGICAL CHANGES OF THE SMALL INTESTINE IN PATIENTS AFTER PARTIAL GASTRECTOMY. *(E.)* Beno, I. (Res. Inst. Human Hutr., Bratislava, Czechoslovakia), A. Bucko, V. Chorvathova and J. Babala. *Digestion* 3(2):97-104, 1970.

Small intestinal function (d-xylose test and fecal fat excretion) was measured and jejunal biopsies from 60 patients following partial gastrectomy were studied. Twenty healthy volunteers served as controls in the d-xylose test. The mean d-xylose plasma level in patients (at 2 hr after d-xylose consumption) was 30.9 ± 8.1 mg/100 ml, compared with 41.5 ± 10.2 mg/100 ml in the control group. In 21/60 patients the plasma level of d-xylose was lower than the lowest level in the control group (27.7 mg/100 ml). The mean quantity of d-xylose excreted in the urine after 5 hr was 6.2 ± 2.8 g in the patient group, and 8.8 ± 3.0 g in the control group. The mean fat excretion in the stool was 5.7 g/day (range: 0.8 - 21.3 g/day) in all patients, and in 11 patients (32.3%) the excretion of fat was higher than 5.0 g/day. Jejunal biopsy revealed a normal jejunal mucosa in 14 patients (23.3%); a mild interstitial jejunitis in 12 patients (20.7%), an interstitial jejunitis with signs of atrophic jejunitis in 8 patients (12.7%), and no cases of severe atrophic jejunitis.

5074 STUDIES IN FOLIC ACID ABSORPTION WITH ^{3}H-PTEROYLGLUTAMIC ACID. *(Ger.)* Schulten, H. J. (1st Med. Clin. U. Hamburg, Germany) and K. Becker. *Z Gastroent* 8(2):80-83, 1970.

Folic acid absorption was studied in blood and urine samples after an i.v. or i.m. administration of 15 mg of folic acid in 25 patients (controls) without malabsorption, 3 patients with idiopathic steatorrhea, 3 patients with chronic hepatitis and 3 patients with cirrhosis. Serum folic acid levels in controls at 30 and 120 min after i.v. folic acid administration were 1.0% and 0.75%, resp., of the administered dose. Serum folic acid levels at 30 min after folic acid administration were decreased in patients with steatorrhea, hepatitis or cirrhosis and at 120 min were decreased only in patients with hepatitis. Approximately 43% of an i.m. dose of 15 mg of folic acid was eliminated in the urine within 24 hr in controls, 26% in patients with steatorrhea, 33% in patients with cirrhosis, and 38% in patients with hepatitis. Folic acid absorption determinations may be useful in the diagnosis of malabsorption syndromes.

5075 WHOLE BODY COUNTING OF VITAMIN B_{12} ^{58}Co ABSORPTION BY PROFILE SCANNING. *(E.)* Finlayson, N. D. C. (Roy. Infirm., Edinburgh, Scotland), J. D. Simpson and D. J. C. Shearman. *Scand J Gastroent* 5(4):261-264, 1970.

The profile scan patterns and Vitamin B_{12} absorption were measured for one week in 24 subjects following administration of a test dose of 0.5 μg cyanocobalamin containing 1 μC of ^{58}Co. All subjects had normal liver function tests, 15 had normal absorption (> 40%) of cyanocobalamin, and 9 had malabsorption (< 25%). The mean stool radioactivity in the 24 hr preceding the final whole body count and profile scan study on the seventh day was 0.6% (range: 0 to 5%) of the test dose. Twenty-one of the 24 subjects showed a two-peaked pattern of profile scan during the absorption test week. A normal subject showed an initial single radioactivity peak over the stomach, which in 24 to 48 hr was replaced by two peaks: the first over the liver and the second over the bowel ("the intestinal peak"). The intestinal peak tended to disappear between the third and sixth day, accompanied by the largest fall in body radioactivity. No subject showed a fall in whole body radioactivity of more than 5% between the disappearance of the intestinal peak and the end of the test. Three of the 24 subjects showed only one peak of radioactivity during the test, and the pattern was associated with malabsorption. One subject with normal absorption did not show a separate intestinal peak during the test, presumably as a result of the overlapping of the liver and intestinal radioactivity.

5090 PROPULSION (MASS MOVEMENTS) IN THE HUMAN COLON AND ITS RELATIONSHIP TO MEALS AND SOMATIC ACTIVITY. *(E.)* Holdstock, D. J. (Central Middlesex Hosp., London, England), J. J. Misiewicz, T. Smith and E. N. Rowlands. *Gut* 11(2):91-99, 1970.

Radiopaque markers, radiotelemetering capsules, Perspex capsules containing ^{51}Cr, and free ^{51}Cr sodium chromate were used to measure the propulsive activity of the colon of 27 patients, 19 of which had the irritable colon syndrome. Intraluminal pressure activity rose from a pre-meal level of 10.5-15.3% to a level of 35.4% during eating and 23.7-32.4% after eating; motility increased from a pre-food level of 0.82-0.97 to 1.61 while eating and 1.44-1.64 after eating. The increase in intraluminal pressure was rarely associated with propulsive activity in the resting patient but physically active patients exhibited an increased propulsion of colon contents after meals. This colonic propulsion was carried out by a series of mass movements. ^{51}Cr either in capsules or in free form allowed repeated observations on the some patient without recourse to radiography. Radiopaque markers also allowed repeated observations when films exposed at low mA were used. Somatic activity is seemingly an important factor in the control of colonic transit.

Ulcerative Colitis

5122 THE DETOXIFICATION OF THE LIVER, BY MEANS OF THE GLUCURONIDATION OF o-IODOBENZOIC ACID-^{131}I (OIB-TEST) IN ULCERATIVE COLITIS: PRELIMINARY. *(Ger.)* Dohnalek, J. (1st Med. Clin., J. E. Purkyne U., Brno, Czechoslovakia), J. Polcakova, M. Eysselt, M. Skalova and A. Polaskova. *Wien Med Wschr* 120(16):285-287, 1970.

A method for the determination of morphological changes in the liver in ulcerative colitis by means of o-iodobenzoic acid-I^{131} glucuronidation was developed and conducted during a 6 hr period following the oral administration of 2 mg of this compound together with 20 µC radioactive iodine. The metabolites of 3 urine samples were separated electrophoretically and evaluated by a Geiger counter and from the relative values of the main metabolite (o-iodine benzoylglucuronide), the absolute values were calculated (in micrograms). An investigation in 47 ulcerative colitis patients (15 with light, 23 with moderate, and 9 with severe forms) was carried out together with liver function tests, and the increased glucuronidation (with respect to the other 3 fractions) and the glucuronide excretion determined at the 2nd, 4th, and 6th hr after o-iodobenzoic acid administration. In 28 of the 47 patients (50.7%), glucuronidation was increased and in 16 of these (53.5%) a simultaneous increase in glucuronides occurred (the o-iodine benzoylglucuronides being increased about 90%). An increased absolute value of glucuronides was found in 21 cases (46.7%), in 14 of whom glucuronidation was increased (66.6%). No correlation was found between glucuronidation values and its kinetics. Changes in glucuronidation were most pronounced in the severe forms of ulcerative colitis, with each urine specimen (2, 4, and 6 hr) showing an increase of 90% of the o-iodine benzoylglucuronide over the other metabolites. The liver function tests in ulcerative colitis are seemingly more often abnormal than has been supposed, and should be investigated.

Granulomatous Colitis

5134 THE RETRORECTAL SOFT TISSUE SPACE IN CHILDREN: NORMAL VARIATIONS AND APPEARANCES IN GRANULOMATOUS COLITIS. (*E.*) Eklof, O. (Karolinska Hosp., Stockholm, Sweden) and J. Gierup. *Amer J Roentgen* 108(3):624-627, 1970.

The normal variation and appearance of retrorectal soft tissue was established in a series of 160 children (both sexes, age 1 to 15 years) with vague abdominal disorders, but without signs of inflammatory large bowel disease. Normal range of retrorectal soft tissue thickness (measured at shortest distance between rectum and sacrum) varied between 1 and 5 mm and retrorectal soft tissue varied from 6 to 20 mm in 8 of 28 children with granulomatous colitis. Increase in thickness was slight in 5/8 children with granulomatous colitis and was generally less marked than widths given for patients with ulcerative colitis. Marked fibrosis was observed in 5/8 children while one patient showed a less pronounced fibrosis (edema and enlarged lymph glands were present). Two patients exhibited moderate fibrosis but normal retrorectal soft tissue thickness. For differential diagnosis of granulomatous colitis and ulcerative colitis, measurement of retrorectal space thickness seemingly is non-specific and therefore insignificant, and the prognostic importance of retrorectal swelling is not yet determined.

5136 COMBINED TELECOBALT AND 5-FLUOROURACIL THERAPY IN CARCINOMA OF THE PANCREAS: A REPORT OF 97 CASES. *(E.)* Falkson, G. (H. F. Verwoerd Hosp., Pretoria, South Africa), H. C. Falkson and T. Fichardt. *S Afr Med J* 44(15):444-449, 1970.

Combined telecobalt and 5-fluorouracil therapy was investigated in 97 cases (68 males and 29 females) of advanced pancreatic carcinoma. Of 12 patients who received radiotherapy alone, none showed remissions (mean survival—2.3 months; median survival time 1 month). Forty-five (55.6%) of 81 patients treated with 5-fluorouracil, 12.5 mg/kg i.v., and radiotherapy showed objective response lasting from 1 to 20 months (average survival time for responders was 9.5 months; median time was 7 months). In 24 (60%) of 45 patients responding to combination treatment, remissions lasted for 5 months or longer (average survival 12.8 months). Of the 60 patients receiving combined therapy who were not extremely ill, 75% responded both objectively and subjectively. Side effects with 5-fluorouracil included mild nausea, diarrhea, thrombocytopenia, photosensitivity, hyperpigmentation and alopecia. Median survival time for patients treated with combined therapy was not significantly greater than that reported for untreated patients, but the therapy is an acceptable short-term method for advanced pancreatic carcinoma treatment.

5137 PANCREATIC FUNCTION FOLLOWING PROXIMAL PANCREATECTOMY. *(E.)* De Lane, L. R. (U. Texas Med. Branch, Galveston), J. C. Fish and W. M. Haglund. *Texas Rep Biol Med* 27(4):963-968, 1970.

Pancreatic function was studied in 12 parasite-free mongrel dogs following pancreatectomy (Group I, pancreatic duct obstruction in 6 dogs; Group II, no prior obstruction in 6 dogs). Pancreatic atrophy occurred in both groups of dogs following proximal resection of pancreas. Atrophy and the resulting pancreatic insufficiency were due to stenosis of pancreatic duct at implantation site. Parenchymal atrophy also affected islet cell formation leading to insulin insufficiency and abnormal glucose tolerance. Preliminary obstruction of pancreatic duct did not influence the eventual outcome of proximal pancreatectomy. Direct duct-to-bowel-mucosa anastomosis instead of pancreatic stump invagination into bowel lumen seemingly may prevent pancreatic insufficiency.

5164 QUANTITATIVE SPECTROPHOTOMETRIC FAT DETERMINATION IN HUMAN LIVER. *(Ger.)* Amend, H. (Path. Inst. St. Hosp. Frankfurt, Germany), W. Reif and H. Zimmerman. *Acta Histochem* 35(2):209-219, 1970.

A technique for the quantitative determination of fatty degeneration in human liver, removed 8 to 24 hr after death, involves the use of 50-micron-thick frozen sections, dehydrated and stained for 60 min in propelene glycol-Sudan IV solution. After differentiation (15 min in 85% propylene glycol), the dye is extracted by acetone and its quantity photometrically determined. The optimal fat-absorption period of the dye was determined at 60 min by 10 duplicate experiments; with increasing dilution maximal transmission was displaced toward shorter wave-lengths. The 500 millimicron wave-length was selected for optimal sensitivity. A standard curve, constructed from various Sudan IV solutions in acetone, was found to follow Beer's Law. Specimens of fatty liver were treated in this way for fat determination with resulting values of 0.16-4.2 percent. Specimens revealed no correlation between the quantity of fat absorbed and the type of fat. Liver tissue that was histologically fat-free was shown to have dye-embedding of about 0.6 μg/mg tissue. Quantitative fat determinations were graded, low fat content as 1.9-2.5 μg/mg, and 5.0-10.0 μg/mg as a high fat content.

5165 A CONTRIBUTION TO THE THERAPY OF LIVER DISEASES: FURTHER OBSERVATIONS IN THE THERAPEUTIC APPLICATION OF LEGALON. *(Ger.)* Schopen, R. D. (St. Hosp. Osnabruck, Germany) and O. K. Lange. *Med Welt* 21(15):691-698, 1970.

Biochemical, histologic and electron microscopic liver biopsy studies were performed on 72 patients with hepatic parenchymal involvement (in alcoholism, diabetes, and poisoning) who were treated with Legalon (6-12 tablets daily). Normalization of blood chemistry was found to agree in most cases with diminution of fatty liver and cholestasis and complete parenchymal regeneration, within 7 treatment weeks; during this period, electron microscope studies revealed the disappearance of mitochondrial vacuolation, dilatation of endoplasmic reticulum, loss of ribosomes and glycogen, and a normal appearance of cell organelles. Biochemical changes observed during therapy include: SGOT (from 33.6 mU/ml before therapy to 11.6 after therapy); SGPT (27.3 to 11.0); BSP at 45 min (13.1 to 5.7 percent retention); cholesterol (256 mg to 225); iron (177 gamma percent to 132). Tolerance to Legalon was good, with no observed side effects.

5166 INHIBITION OF GROWTH OF THE FETAL RAT LIVER AND PLACENTA THROUGH IRRADIATION. *(Ger.)* Mitznegg, P. (Pharm. Inst. U. Erlangen-Nuremberg, Germany), F. Heim, M. Sabel and H. Pauly. *Strahlentherapie* 139(2):251-257, 1970.

The effect of radiation (500 rad whole body ^{60}Co-gamma rays irradiation at 58 rad/min) on fetal liver and placental growth, in Sprague-Dawley female pregnant (16th, 17th, 18th, 20th day of pregnancy) rats, was investigated. In untreated animals, fetal liver and placental weight increased 23- and 1.8-fold, resp., between the 16th and 22nd day of pregnancy (termination of pregnancy). The DNA content and liver nuclear cells of the fetal liver decreased (-55%, -44%, resp.) in the irradiated animal (20th day), the decrease being even greater as a result of earlier (16th day) irradiation (-65%, -62%, resp.). The difference in RNA content, liver protein, liver weight and body weight of the fetus on the 20th day between irradiated animals and controls was slight, but was increased in earlier irradiated animals. In the placenta, no significant changes were obwerved on the 20th day, the highest difference occurring on the 16th day with respect to weight (-18%) and on the 18th day with respect to DNA, RNA and protein (20, 20, 18%, resp.). After partial irradiation (100 rad daily between days 16 and 20) fetal liver DNA (-38%), RNA, protein and cell content (-10 to -26%) decreased. Even after the irradiation-sensitive phase of the organogenesis in the fetus was concluded, inhibitions of the synthesis mechanism could be seen. Radiation damage evidently was reduced when the dose was divided over a longer period of time.

5167 PLASMA LECITHIN-CHOLESTEROL ACYLTRANSFERASE AND ERYTHROCYTE LIPIDS IN LIVER DISEASE. *(E.)* Gjone, E. (U. Hosp., Oslo, Norway) and K. R. Norum. *Acta Med Scand* 187(3):153-161, 1970.

Plasma lecithin-cholesterol acyltransferase activity and erythrocyte cholesterol content were determined in patients with chronic hepatitis, liver cirrhosis or obstructive jaundice. The patients with hepatitis or cirrhosis had lower lecithin-cholesterol acyltransferase activities (% free cholesterol esterified/hr) than normal controls (0.6% compared to 3.0%) and higher erythrocyte cholesterol content (1.44 x 10^{-10} compared to 1.11 x 10^{-10} mg/cell) with a significant correlation in cholesterol concentration in the red cell and the plasma. Patients with obstructive jaundice had extremely low lecithin-cholesterol acyltransferase activities (0.14%) and a marked increase in erythrocyte cholesterol content (1.86 x 10^{-10}).

5168 ACUTE VENO-OCCLUSIVE DISEASE OF THE LIVER. *(E.)* Brooks, S. E. H. (Dept. Path., U. West Indies, Kingston, Jamaica), C. G. Miller, K. McKenzie, J. J. Audretsch and G. Bras. *Arch Path* 89(6):507-520, 1970.

Six case reports (2 boys, 4 girls, 2 to 11-yr-old) are presented of acute veno-occlusive disease of the liver in which liver biopsy material was studied by light and electron microscopy. The sinusoids and subterminal and terminal hepatic veins had marked endothelial damage, accompanied by extravasation of erythrocytes into Disse's space and naked hepatocytes showing a reduction in microvilli. Endothelial damage was seen in all zones of the liver. At the level of the terminal hepatic veins, the closed structure of these vessels, absence of fenestrations, existence of a basement membrane, and the presence of collagen and connective tissue cells in the wall provided resistance to erythrocytes and cellular debris tracking up Disse's space and these factors tended to result in narrowing of the lumen. Parenchymal cell alterations, at the time of the biopsies, included dilation of bile canaliculi, abundant glycogen, and nuclear invaginations.

5169 ULTRASTRUCTURAL CHANGES IN THE GOLGI APPARATUS IN THE LIVER OF RATS WITH TOCOPHEROL DEFICIENCY. *(E.)* Djaczenko, W. (Med. Acad. Wroclaw, Poland), M. Urbanowicz and J. Grabska. *Acta Med Pol* 10(4):415-427, 1970.

Liver parenchyma cells were studied in Wistar rats with experimentally induced tocopherol deficiency. Electron microscopy (ultrathin section technique) in tocopherol-deficient animals (compared to controls) revealed Golgi apparatus in parenchymal cells with extensive changes consisting of decreased number of canals in nearly every apparatus and their transformations. Canals which formed the layers of the Golgi apparatus were elongated, showed a tendency to be curved, and in extreme cases showed formation of ring forms. The opposite poles of canals were dilated and their contents showed moderate electron-microscopic density; focal condensations later appeared in the amorphous masses filling the dilations. Canicular dilations then separated and migrated toward cytoplasm and their volume increased in the cytoplasm, and dense masses differentiated to nucleoids, which changed into typical "dense bodies" (probably lysosomes). Many dense bodies filled the cytoplasmatic zones adjacent to intercellular bile ducts. Dilated canals of endoplasmic reticulum or altered mitochondria (typical of tocopheral deficiency) were observed near Golgi apparatus. Experimental animals also showed large lipid deposits near apparatus in parenchymal cells. Golgi apparatus changes due to tocopherol deficiency are seemingly due to alterations in cytophysiology and not to molecular alterations.

5170 THE RELATIONSHIP BETWEEN GLUCOCORTICOID BINDING AND TYROSINE AMINOTRANSFERASE INDUCTION IN HEPATOMA TISSUE CULTURE CELLS. *(E.)* Baxter, J. D. (Nat. Inst. Arthritis Metab. Dis., Nat. Inst. Hlth., Bethesda, Md.) and G. M. Tomkins. *Proc Nat Acad Sci USA* 65(3):709-715, 1970.

Rat hepatoma tissue culture cells were used to determine the relation between glucocorticoid binding and tyrosine aminotransferase induction. Uptake of ^{3}H-dexamethasone by the culture cells increased with increasing steroid concentration, with components becoming saturated below 5×10^{-8} M, and approximately linear uptake above this concentration. Cells incubated with dexamethasone or cortisol and fractionated into purified nuclear and homogenate supernatant fractions showed that, in the nuclear fraction, the distribution of the steroid between cells and incubation medium decreased markedly with increasing steroid concentration. At 5×10^{-9} M, uptake of ^{3}H-dexamethasone was maximal in about 30 min and at 10^{-6} M within about 10 min. Binding to specific nuclear receptors at 5×10^{-9} M dexamethasone was also maximal within 30 min while the homogenate supernate uptake was maximal within 5 min. After 24 hr, when the tyrosine aminotransferase concentration was high, the steroid bound to the specific receptors was somewhat less than after 30 min and the relative affinity for the specific receptors for dexamethasone and cortisol was similar to their relative effectiveness as inducers. Testosterone, 17α-hydroxyprogesterone, epicortisol and androstenedione, and cortisol and dexamethasone affected cortisol binding to the specific receptors in direct relation to their effect on cortisol induction. After incubation of culture cells with 5×10^{-9} and 10^{-5} M ^{3}H-dexamethasone for 30 min and for 14 hr, no significant amount of metabolites was detected in any of the extracts. From cells incubated with 5×10^{-9} M cortisol, most of the radioactivity from nuclear extracts migrated with cortisol while less than 20% migrated with di- and tetrahydrocortisol.

5171 ONE YEAR SURVIVAL AND FUNCTION AFTER HETEROTOPIC LIVER AUTOTRANSPLANTATION. *(E.)* Tamvakopoulos, S. K. (Div. Biol. Med. Sci., Brown U., Providence, R.I.) and H. T. Randall. *Surg Gynec Obstet* 130(5):859-864, 1970.

In a series of 221 albino Sprague-Dawley rats subjected to a partial hepatectomy, the survival of a graft (a 3 to 5 g liver tissue mass transplanted to the splenic bed and supplied by collateral splenic blood vessels), preservation of liver function, and physiologic response of the animals were observed for 12 months. Of 221 rats operated upon, 187 survived and were killed sequentially during the following 12 months while 36 rats were killed for studies one yr after autotransplantation and histologic studies and glucose-6-phosphatase determinations were performed in hepatic tissue homogenates. Histologic sections of transplants showed survival and maintenance of cell integrity, and gross examination of the liver revealed intact lobular structure and no excessive fibrosis or proliferation of bile ducts. No difference of glucose-6-phosphatase activity or deoxyribonucleic acid and protein contents were demonstrated between the transplant and the liver. After a second partial orthotopic hepatectomy performed one yr after autotransplantation, values of glucose-6-phosphatase, protein and DNA in the autotransplant resembled those of regenerating liver, rather than normal liver. Glucose-6-phosphatase activity (μ/moles P/min $\times 10^{-5}$) ranged from approximately 6.8 to 8 in normal liver, compared with a range of 8 to 9.5 in 24-hr regenerating liver and 8.5 to 10 in transplanted liver. Tissue protein content (g protein/100 g liver tissue) ranged from 15 to 18 g in normal liver, compared with 23 to 25 g in 24-hr regenerating liver, and 24 to 27 g in transplanted liver. DNA content (mg/g liver) was assayed by colorimetric test and had a range of 2.3 to 2.6 in normal liver, compared with 2.9 to 3.2 in 24-hr regenerating liver, and 2.9 to 3.2 in transplanted liver. A metabolic response seemingly occurs in the heterotopically-located hepatocytes similar to that of the normal liver.

5172 CLINICAL STUDY OF A NEW CHOLERETIC SYNTHESIZED FROM AN OLD SPASMOLYTIC. *(Fr.)* Micheletti, J. (no affil). *Clinique* 65(2):168-172, 1970.

The effect of Vedrenan (1-(5',6'-dihydro-2'H-pyranyl-3')-2-phenylethanol) was studied in 36 patients (28 men, 8 women) with various hepato-digestive diseases (viral hepatitis, dyspepsia, cirrhosis or pre-cirrhotic states, and functional colonopathies). In most cases 3 tablets were given daily (in some cases 2 or 4 were given), for 15 days to 3 months depending upon the progress of the illness. In 10 of the 12 cases of viral hepatitis, jaundice was no longer present after 15-20 days of treatment and body weight was increased by 1-4 kg. Cholesterol esters were normalized in all 9 cases tested, transaminases were normalized or improved in 8 of 10 cases tested, and improvement was seen in 6-9 cases with regard to other hepatic tests. In 6 of 8 patients with dyspepsia, all 4 cirrhotics, and all 5 colonopathies, a general improvement followed Vedrenan treatment. Overall success of Vedrenan treatment was calculated as 85.9% and the tolerance was found to be high.

5173 RECENT OBSERVATIONS IN THE PATHOGENESIS OF THROMBOCYTOPENIA IN CIRRHOSIS OF THE LIVER AND THE HYPERSPLENISM SYNDROME.

(Ger.) Schulz, K. (Med. Clin. U. Rostock, Germany), S. Preussner and G. Frick. *Z Ges Inn Med* 25(6):267-271, 1970.

Platelet counts were determined in 280 patients with various liver diseases (cirrhosis, chronic hepatitis, liver metastases, fatty liver, and hypersplenism of various origin) to investigate the pathogenesis of thrombocytopenia in patients with chronic liver disease. Platelets were significantly decreased ($p < 0.1\%$) in patients with liver cirrhosis as well as chronic right heart insufficiency ($p < 5\%$). In patients with liver disease, the thrombocyte count was significantly different ($p < 0.1\%$) in those with (decreased) and those without splenomegaly. Thrombocyte count was increased in the enlarged spleen where an increased disintegration of thrombocytes was often manifested. In isolated cases, the liver seemingly may take over the thrombocytoclastic function of the spleen and the duration of the disease and the severity of the lesion of the liver parenchyma apparently are of importance for the development of the thrombocyte deficit.

5174 EXPERIMENTAL HEPATIC PELIOSIS WITH ALLYL-ALCOHOL: ENZYMATIC AND HISTOLOGIC STUDY.

(Fr.) Barbier, P. (Saint-Antoine Hosp. Paris, France), V. Schwarzmann, N. Berthaux, Y. Hecht and J. Caroli. *Acta Gastroent Belg* 33(1):19-29, 1970.

Enzymatic and histological aspects of the hepatotoxicity of allyl alcohol (0.4 cm^3 of 1.5% solution/100 g, gavage) were studied (at 4, 6, 10, 14, 18, 24, and 48 hr) in fasted female Wistar rats. Enzymes were massively liberated upon intoxication, serum levels of lactic and malic dehydrogenases paralleling in a rise from normal (250 units) to 16,500 units at the 4th hr, 12,550 units at the 10th hr and returning to normal at the 48th hr (a second gavage resulting in only moderate increases). SGPT activity was increased (43 to 663 units) after the 2nd hour, was maximal (73,000 units) 6 to 18 hours after intoxication and returned to normal at the 48th hour. Histologically, early hepatic lesions resembled those of peliosis, but later figures of hepatic necrosis appeared, and still later, necrotic foci underwent sclerous organization. Hepatic alcohol dehydrogenase was not significantly modified by allyl alcohol.

5175 THE PRESENCE OF ALDOLASE C IN RAT HEPATOMA.

(E.) Sugimura, T. (Natl. Cancer Ctr. Res. Inst., Tokyo, Japan), S. Sato and S. Kawabe. *Biochem Biophys Res Commun* 39(4):626-630, 1970.

Yoshida ascites hepatoma cells (AH100B and AH143A) were innoculated i.p. in the rat, and one week later were withdrawn, washed with cold saline, and the activity of aldolase was determined spectrophotometrically at 340 mμ, and by electrophoresis on a cellular acetate membrane. The extract of AH143A cells showed a dominant band of aldolase A, a distinct band corresponding to the A_3C hybrid, and a faint A_3C hybrid band, all previously observed in brain tissue. The elution pattern of the aldolase of AH143A cells on DEAE-cellulose column chromatography revealed a distinct two-peaked pattern which corresponded directly to the aldolase A and the A_3C hybrid activity observed in brain. The term "dis-differentiation" is proposed for the phenomenon involving the switch-off of the gene for aldolase B and the switch-on of the gene for aldolase A during hepato-carcinogenesis.

5176 ULTRASTRUCTURAL CHANGES OF MITOCHONDRIA IN THE RAT LIVER IN EXPERIMENTAL TOCOPHEROL DEFICIENCY.

(E.) Djaczenko, W. (Inst. Immun. Exp. Ther., Polish Acad. Sci., Wroclaw), M. Urbanowicz and J. Grabska. *Acta Med Pol* 11(1):77-95, 1970.

Ultrastructural changes of mitochondria were investigated in livers of Wistar rats with tocopherol deficiency by means of electron microscopy using the ultra-thin section technique. Structural changes occurring in mitochondria of experimental animals were related to degree of involvement of remaining cell components. Experimental animals showed two club-shaped, distended mitochondria connected by a narrow isthmus of various width; mitochondrial cristae or membranes divided the isthmus perpendicularly. Mitochondria in experimental animals exhibited a greater frequency of cell division compared to controls (ratio 7:1). Most frequent type of ultramorphologic change in mitochondria from experimental rats were degrees of organelle enlargement with occasional increased optical density of matrix and development of intramitochondrial system of membranes. In extreme cases, giant mitochondria were formed (up to 5 microns in diameter and oval shaped), in which mitochondrial matrix failed to show reduced optical density and cristae were usually hypertrophic. Organelles with enlarged mass were also observed and formed processes connected with main mass of organelle. All mitochondrial changes were purely volumetric, but did not present symptoms of mitochondrial swelling. Mitochondrial alterations were interpreted as a consequence of lipid peroxidation caused by vitamin E deficiency, in which peroxidation of polyunsaturated fatty acids apparently plays an important role.

5177 GLUCURONYLTRANSFERASE ACTIVITY IN TRANSPLANTABLE RAT HEPATOMAS. *(E.)* Lueders, K. K. (Nat. Cancer Inst., Nat. Inst. Hlth., Bethesda, Md.), H. M. Dyer, E. B. Thompson and E. L. Kuff. *Cancer Res* 30(2):274-279, 1970.

Several transplantable rat hepatomas (Morris 7787, 7316A, 7794A, 3924A, 3683, Reuber H35 and H139, and Novicoff) were assayed for *p*-nitrophenylglucuronyltransferase activity and compared on a tissue protein basis with normal and host liver. When enzyme specific activity was determined from kinetic data on preparations activated with triton X-100, the glucuronyltransferase activity in hepatomas 7794A (300 ± 60), 7787 (68 ± 32), 7316A (53 ± 3) and H35 (40 ± 9) was increased when compared to normal and host liver (9-16) while activities in 3924A (22 ± 3) and 3683 (14 ± 2) hepatoma were comparable to those of host liver. Similar results were obtained when assays were performed on freshly prepared homogenates. In hepatomas, there was an apparent increase in the number of enzymatic sites per unit of microsomal protein as compared with liver as judged by the maximal velocity of reaction measured for microsomes. Glucuronyltransferase activity of rat liver was induced to the level present in the well-differentiated (H35, H139 and 7794A) hepatomas 45 hr after a single dose of 3-methylcholanthrene (5 mg/100 g body wt in 1 ml corn oil, i.p.). β-glucuronidase activity with *p*-nitrophenyl-β-glucuronide as substrate was low for both liver (2.1-5.9) and hematoma preparations (1.0-7.4) when measured under the conditions used to assay glucuronyltransferase activity and it is assumed that it had little or no effect on the enzyme activities observed for hepatomas and livers. The ability of tissue culture cells derived from Morris 7288C hepatoma to conjugate *p*-nitrophenol added to the medium (5 x 10^{-5} M), indicated that glucuronyltransferase as well as uridine diphosphate glucuronic acid synthesis and cell transport are functional in this hepatoma.

LIVER AND BILIARY TRACT

Acute Nonviral Hepatitis and Hepatic Injury

5221 HEPATIC MITOCHONDRIAL FRAGILITY AND PERMEABILITY: EFFECT OF ETHANOL AND CHOLINE DEFICIENCY. *(E.)* French, S. W. (Harbor Gwn. Hosp., Torrance, Calif.) and T. Todoroff. *Arch Path* 89(4):329-336, 1970.

Mitochondrial damage induced by ethanol ingestion and choline deficiency (hypolipotropic diet) and the effect of a choline-rich diet on the ethanol-induced mitochondrial injury were measured in male Wistar rats. The combination of ethanol and a choline-deficient diet caused an increase in liver mitochondrial permeability indicated by a significant increase in succinic dehydrogenase activity. Rats fed a combination of ethanol and a choline-deficient diet or ethanol plus a choline-supplemented diet developed an increase in mitochondrial fragility when compared to control groups. Choline deficiency alone increased succinic dehydrogenase activity and slightly increased mitochondrial fragility. Rats fed ethanol showed a significant increase in succinic dehydrogenase activity which indicated that mitochondrial fragility was increased; choline supplement tended to lessen this increase in fragility but not to a significant degree. There was an increase in succinic dehydrogenase activity produced by a diet marginal in choline, when compared with the values from control rats receiving choline-supplemented diets. The mitochondrial fragility induced by ethanol seemingly is not due to an increase in the requirement for choline.

5222 TURNOVER OF HEPATIC COLLAGEN IN REVERSIBLE AND IRREVERSIBLE FIBROSIS. *(E.)* Hutterer, F. (Mt. Sinai Sch. Med., City U. New York, N. Y.), M. Eisenstadt and E. Rubin. *Experientia* 26(3):244-245, 1970.

Liver collagen and glycine-C^{14} (10 μC/100 g, i.p.) uptake were determined in rats with carbon tetrachloride-induced hepatic fibrosis. Hepatic fibrosis was reversible when carbon tetrachloride treatment was stopped after 60 days (Group 1) and irreversible when stopped after 140 days (Group 2); glycine-C^{14} uptake was higher in Group 1 (30,000 cpm) than in Group 2 (6000 cpm). The suggested multicompartmented system (reversible and irreversible fibrosis) was computer analyzed using the iterative method of Sheppard and the half life of the 2 insoluble collagen components in the reversible phase was determined as 3 days and 37 days, resp., while in the irreversible phase it was 7 days and 301 days, resp. The longer half life of the second component of the irreversible phase suggests that a decreased rate of collagen catabolism rather than increased synthesis distinguishes the irreversible phase from the reversible phase of fibrosis.

5223 MULTIPLE HALOTHANE EXPOSURE AND HEPATIC BROMSULPHTHALEIN CLEARANCE. *(E.)* Biebuyck, J. F. (Radcliffe Inf., Oxford, England), S. J. Saunders, G. G. Harrison and A. B. Bull. *Brit Med J* 1(5697):668-671, 1970.

Hepatic BSP clearance was studied in isolated perfused livers and liver homogenates from Wistar and Sprague-Dawley rats previously exposed to halothane. In isolated perfusion studies, a significant increase in BSP retention occurred at 1 week (18.0 ± 3%) and 3 weeks (29.0 ± 6%) following 3 halothane exposures (control 5.0 ± 3%). There was no significant difference in BSP retention in animals receiving a single halothane exposure (6 ± 3%) followed by a 3-week interval compared to controls. Animals receiving 3 halothane exposures followed by a 6-week interval and 3 further halothane exposures showed significant BSP retention (1 week, 18 ± 2% and 3 weeks, 21 ± 5%, control 5 ± 3%); results did not differ significantly from animals with 3 halothane exposures. Diethyl ether exposure did not produce significant BSP changes. In liver homogenate studies in similarly pretreated animals, there was a significant decrease in BSP-glutathione conjugating enzymes at 2 and 3 weeks following multiple halothane exposure (1.49 ± 0.28 and 1.68 ± 0.4 mg BSP-conjugated/g. liver wet weight/5 minutes, resp.; control 2.10 ± 0.62). Present data shows an apparent delayed hepatic effect of multiple halothane exposure. The mechanism supporting increased BSP retention suggests that removal of BSP from plasma is seemingly dependent on simultaneous operation of 2 processes: a) uptake into hepatic storage compartment and b) excretion into bile.

LIVER AND BILIARY TRACT

Acute Viral Hepatitis

5251 THE ROLE OF THE LIVER IN ^{59}Fe-KINETICS. *(Ger.)* Montz, R. (Radiol. U. Clin., Hamburg, Germany). *Nuclearmedizin* 9(1):62-69, 1970.

Radioiron distribution in the liver of 300 patients with liver disorders, receiving 7 mC ^{59}Fe, was determined by a standard Human-Phantom-Remcal apparatus. No ^{59}Fe accumulation in the liver was found in 147 of 200 cases examined, and in 20 of these cases (examined by a liver biopsy) the iron activity at 0 hr was 4100 Ipm and at 24 hr was 2400 Ipm. Compared with the scan (100% in liver = 35,500 Ipm) it appears that a 7-8% (24 hr) and a 4% (0 hr) iron accumulation may be expected normally after radioiron administration. Surface activity in different grades of iron accumulation in liver and total reticulohistiocyte system in patients with hemotological disease are as high as 75% and 100%, resp. Thirty patients were within 0-10% in both examinations, which were confirmed by biopsy.

5252 FOLLOW-UP STUDIES IN INFECTIOUS HEPATITIS. *(Ger.)* Fleischmann, M. (Red Cross Hosp., Gotha, Germany). *Med Klin* 65(25):1206-1211, 1970.

Patients (1026) who had suffered with infectious hepatitis were surveyed for residual liver damage after 5 yr. Of the patients that were surveyed, 579 were examined (412 children under 14 yr of age; 167 adults of various age groups). Clinical observations included the examination of the liver, spleen and skin (particular attention was paid to patients who had been ill for over 6 wk); laboratory tests included sedimentation rate, thymol turbidity, electrophoresis, bilirubin and transaminase (a BSP was performed when abnormal test results were obtained; some radiological examinations were performed). Recurrent episodes were treated in 123 ambulant patients; 125 patients had had a delayed convalescence and 79 patients showed some liver function disorders from the laboratory tests (45 biopsies were taken). Typical signs of cholecystopathy were found in 14 patients (9 with cholelithiasis, 5 with dyskinesia of the bile duct). Of the patients with chronic progressive hepatitis, 4 were treated as ambulant patients and 3 were hospitalized.

5253 IMMUNOLOGIC DISTINCTION BETWEEN INFECTIOUS AND SERUM HEPATITIS. *(E.)* Prince, A. M. (New York Blood Ctr., New York), R. L. Hargrove, W. Szmuness, C. E. Cherubin, V. J. Fontana and G. H. Jeffries. *New Eng J Med* 282(12):987-991, 1970.

Sera from patients with acute viral hepatitis were tested for presence of serum-hepatitis (SH) antigen by immunodiffusion to determine whether there is an immunologic distinction between infectious and serum hepatitis. Serial serum specimens from 4 patients with short-incubation MS-1 infection (Willowbrook) were negative for SH antigen while the SH antigen was identified in all 8 cases of long-incubation MS-2 infection (Willowbrook). None of 19 sporadic cases in children under age 14 and one of 74 cases of epidemic hepatitis showed presence of detectable antigen. Seventy-six of 116 cases (66%) previously exposed to contaminated needles, 25 of 43 cases (58%) of post-transfusion hepatitis and 71 of 129 cases (55%) of viral hepatitis of unknown etiology were positive for SH antigen. There was no antigen deected in 57 patients with other acute liver disases. SH antigen and not infectious hepatitis virus seemingly is the major cause of endemic hepaitis in urban adults.

5254 BILE ACIDS AND STEROID SULFATES IN SERUM OF PATIENTS WITH INFECTIOUS HEPATITIS. *(E.)* Cronholm, T. (Karolinska Inst., Stockholm, Sweden), L. Norman and J. Sjovall. *Scand J Gastroent* 5(4):297-303, 1970.

he concentrations of major serum bile acids and teroid sulfates were determined by gas chromatography and mass spectrometry in 8 patients during the course of infectious hepatitis. Total bile acid concentration (mg/100 ml) was highly elevated (approximately 10) compared to the normal value (0 to 0.2) and the bile acid/bilirubin ratio was high (1.2 to 0.5) during the icteric phase but dropped (0.2 to 0.01) after recovery. Deoxycholic acid was not detectable during the icteric phase and the chenodeoxycholic/cholic acid ratio was below 1. The steroid sulfates did not change as drastically with the disulfates of 5α-androstane-3α,17β-diol, 5α-androstane-3β,17β-diol,5-androstane-3β,17β-diol and androsterone sulfate dropping slightly during convalescence and dehydroepiandrosterone rising in 5 out of 7 patients.

5255 THE EFFECT OF GLUCOCORTICOID TREATMENT ON PROTEIN SYNTHESIS IN LIVER BIOPSIES OF PATIENTS WITH ACUTE HEPATITIS. *(Ger.)* Richter, E. (Med. Clin., Policlin., Justus Liebig U., Gieben, Germany), S. Rotter, B. Leinweber, H. Liehr, D. Brachtel and H. A. Kuhn. *Acta Hepatosplen* 17(2):84-89, 1970.

Effects of glucocorticoid therapy on hepatic protein synthesis in acute hepatitis was investigated in 25 patients (12 treated with prednisolone, 13 without) kept at bedrest and given Laevoral with a special liver diet. Prednisolone was administered 3 times daily (50, 40, 30, and 25 mg p.o. during the first 10-12 days). Biopsies were taken 2 or 3 days after admission, and again after 10-12 days. In patients with acute hepatitis, protein synthesis (dpm/mg wet weight, measured by ^{14}C labeled glycine and aspartic acid incorporation) was 415 (compared to 87 in normal subjects). In patients not treated with prednisolone, protein synthesis was 415 and 439 (first and second biopsies, resp.) and in patients treated with prednisolone, 415 and 141 resp. Values for bilirubin (mg%), GOT and GPT (mU/ml) among the different groups were, resp.: untreated patients (1st biopsy) 8.2, 451, 472; (2nd biopsy) 4.5, 105 and 112; treated patients (1st biopsy) the same as those for untreated patients; (2nd biopsy) 1.9, 49, 121. In the most acute phases of hepatitis, comparison between prednisolone-treated and untreated patients revealed lower protein synthesis (370 vs. 464), demonstrating that glucocorticoid treatment significantly improved the abnormally high protein synthesis in acute hepatitis.

5256 CONJUGATED BILE ACIDS IN THE SERUM DURING SEVERE JAUNDICE. *(Fr.)* Rautureau, M. (Hosp. St. Antoine, Paris, France), B. Chevrel and J. Caroli. *Rev Medicochir Mal Foie* 45(1):23-32, 1970.

Biliary acid conjugation was studied in 19 cases of acute viral hepatic necrosis and 16 normal subjects by thin layer chromatography. Biliary acids were always glycine- and taurine-conjugated and the G/T ratio was low (< 2.5) in 16 cases of hepatitis. This ratio could not be determined in normal subjects because of the low concentration of biliary acids. In all cases of acute jaundice, both trihydroxy- and dihydroxycholanic acid are increased (especially the latter) with the TriOH/DiOH ratio being less than 0.8. The mechanisms of conjugation synthesis seemingly persist despite hepatic degeneration and high concentrations of conjugated bile acids parallel hepatic degeneration.

LIVER AND BILIARY TRACT

Chronic Hepatitis

5274 THE IMMUNOSUPPRESSIVE TREATMENT OF CHRONIC LIVER DISEASES. *(Ger.)* Wallnofer, H. (A. O. Hosp. Vocklabruck, Austria). *Z Ther* 8(1):5-33, 1970.

Immunosuppressive treatment of chronic liver disease with azathioprin (Imuran) over a period of 4 months to 2 years is reported in 54 cases (19 cirrhotic, 20 with chronic aggressive hepatitis, 6 with persistent acute and subacute forms, 5 with chronic persistent protracted hepatitis, and 4 with lupoid hepatitis). Diagnosis was by liver biopsy, laparoscopy or both. Biopsy results of treatment (150-200 mg followed by 50 mg daily maintenance doses) were divided into three groups: normalization (7.4%), improvement (31.5%), and unchanged (61.1%). Liver function tests followed simultaneously in the three groups indicated improvement in the following percentages: Takatara reaction, 13%, 37%, and 50%; thymol turbidity, 16.7%, 50.0% and 33.3%; SGOT, 37%, 46.3% and 16.7%; SGPT, 38.9%, 42.6%, and 18.5%; LDH, 34.1%, 31.5%, and 44.4%; and SDH, 25.8%, 31.5%, and 42.6%. Successful treatment for the individual groups was 20-30% in cirrhosis, 50% in chronic aggressive hepatitis, and 60-70% in acute and subacute persistent hepatitis. Among the side effects, occasional increases in mitochondrial enzymes (despite a decrease in transaminases) was a sign for cessation of medication. Two hepatic comas developed in the cirrhosis group (one with fatal outcome) and occasional gastrointestinal disturbances persisted despite reduction in dose and treatment frequency.

LIVER AND BILIARY TRACT

Cirrhosis

5277 EFFECT OF 3-METHYLCHOLANTHRENE ON EXPERIMENTALLY INDUCED CIRRHOSIS: A STUDY USING ATS OF VARYING AGES. *(E.)* Reuber, M. D. (Natl. nst. Cancer, Natl. Inst. Hlth., Bethesda, Md), S. rollman and E. L. Glover. *Arch Path* 89(6):531-536, 970.

ale and female Buffalo rats of 5, 12, 24, and 52 eeks of age were used to study the effect of 3-ethylcholanthrene on CCl$_4$-induced cirrhosis. Animals iven 3-methylcholanthrene and control animals did not ave any hepatic lesions. Animals given both CCl$_4$ and -methylcholanthrene lost weight, whereas those given Cl$_4$ gained weight. Male and female rats of all ages urvived for an average of 9.2 weeks and 11.0 weeks, esp. There was a striking increase in the severity f the cirrhosis in male rats of all ages given CCl$_4$ nd 3-methylcholanthrene as compared to those given nly CCl$_4$. The incidence of severe cirrhosis was reater in females of all ages given CCl$_4$ and 3-methlcholanthrene; the differences were greater in 5-nd 12-week-old animals than in the other animals. he incidence of hepatic vein thrombosis was markedly ncreased in male and female animals of all ages iven CCl$_4$ and 3-methylcholanthrene and complete cclusion with infarcts of the liver was observed in 5-week-old male rat, in a 24-week-old female and in 52-week-old female rat. There were more hyperlastic nodules in animals given both chemicals, rticularly those 5 and 12 weeks old.

78 CLINICAL ASYMPTOMATIC FUNCTIONAL DISORDERS OF THE EXOCRINE PANCREAS IN CHRONIC ALCOLICS. *(Ger.)* Goebell, H. (Med. U. Clin., Marburg, rmany), C. Bode, R. Bastian and G. Strohmeyer. *utsch Med Wschr* 95(15):808-814, 1970.

The incidence and extent of pancreatic insufficiency were studied in 54 chronic alcoholics (who had ingested 120 g alcohol daily) with and without liver cirrhosis. Diabetes mellitus was found in 3 patients, and a prediabetic condition in 12 patients (by i.v. glucose tolerance test) otherwise no clinical evidence of severe chronic pancreatitis was seen. Pancreatic excretory function was tested by the secretin-pancreozymin test; 9 of the 22 cirrhotics, and 20 of the 32 non-cirrhotic patients were found to have a malfunction. A disturbance in all the pancreatic tests (lipase, amylase, trypsin, chymotrypsin, protein) following pancreozymin stimulation was found in 5 of the 22 cirrhotics, and in 6 of the 32 non-cirrhotics. Normal values for the pancreatic tests following pancreozymin stimulation were: lipase - 1420 U/min, amylase - 967 U/min, trypsin - 31.2 U/min, chymotrypsin - 90 U/min and protein - 4.0 mg/min. Values (in the same order) for the 5 cirrhotic patients were 700 U, 603 U, 18.3 U, 55 U and 2.2 mg; for the 6 non-cirrhotic patients, 554 U, 415 U, 11.8 U, 42 U, and 2.0 mg. The volume secretion was significantly higher than normal (3.2 ml/min after i.v. secretin) in the cirrhotics (4.2 ml/min) and lower than normal in the non-cirrhotics (2.7 ml/min). The pancreatic malfunction in a total of 29 out of 54 alcoholics reflects the incidence of pancreatic damage in chronic alcoholism which is not manifested clinically.

5279 PROGRESS IN THE THERAPY OF LIVER DISEASES: WITH SPECIAL CONSIDERATION OF A STUDY OF VITAMIN B$_{12}$-LIVER INCORPORATION WITH SIMULTANEOUS ADMINISTRATION OF CORTICOSTEROIDS. *(Ger.)* Eisenburg, J. (Med. Clin. U. Munich, Germany). *Fortschr Med* 88(5):165-174, 1970.

The incorporation of labeled vitamin B_{12} (0.5 µg i.v.) with and without simultaneous cortisone injection (5 or 10 mg) in regenerating liver was studied in 7 patients with chronic hepatitis leading to cirrhosis, 7 patients with hepatic cirrhosis, and 6 healthy subjects. Vitamin B_{12} uptake was lower in damaged livers than in those of healthy controls, and was dependent on hepatic circulation. Lowest uptake was observed in a regenerative, decompensated, advanced cirrhosis. Cortisone administration increased the normal B_{12} uptake from -13.4% to +23.7% (5 mg) and +41.4% (10 mg); and in cirrhotic patients from -12.2% to +36.8 and +55.7%, resp. The observed decrease in vitamin B_{12} uptake in chronic hepatitis and post-hepatic cirrhotic patients depended on the degree of parenchymal damage.

5280 VOLATILE FATTY ACIDS IN THE BREATH OF PATIENTS WITH CIRRHOSIS OF THE LIVER. *(E.)* Zieve, L. (Minneapolis Vet. Hosp., Minn.), S. Chen and V. Mahadevan. *J Lab Clin Med* 75(4):622-627, 1970.

Using gas chromatography the breath of 8 normal subjects, 11 patients with decompensated cirrhosis and 4 patients with compensated cirrhosis were compared with regard to volatile fatty acids. Normal average levels (± S.D.) of acetic and propionic acids (in µg/100 ml condensed vapor) were 79 ± 30 and 23 ± 16, resp., with no measureable isobutyric, butyric, or isovaleric acid. Patients with decompensated cirrhosis had increased levels of acetic and propionic acids (670 ± 449 and 132 ± 82, resp.), as well as increased isobutyric, butyric and isovaleric acids (20 ± 12, 19 ± 24, and 9 ± 13, resp.). Only 4 of the 11 cirrhotic patients excreted isovaleric acid and 8 excreted butyric acid. Four patients with compensated cirrhosis excreted acetic and propionic acids from the lungs in the range of 61 to 385 and 26 to 58 µg/100 ml, resp. There was no relationship between the excretion of volatile fatty acids and the degree of jaundice, but the correlation with the serum transaminase (0.7) was significant. The volatile fatty acids in the breath seemingly reflect the very short chain fatty acids that are absorbed via the portal venous system but bypass the liver in the presence of portosystemic shunts.

5281 MERCAPTANS AND DIMETHYL SULFIDE IN THE BREATH OF PATIENTS WITH CIRRHOSIS OF THE LIVER: EFFECT OF FEEDING METHIONINE. *(E.)* Zieve, L. (Minneapolis Vet. Hosp., Minn.), S. Chen and V. Mahadevan. *J Lab Clin Med* 75(4):628-635, 1970.

Methanethiol, ethanethiol, and dimethyl sulfide were the only sulfur compounds detected (identified and analyzed by gas chromatography) in the breath of normal subjects (7), cirrhotic patients (13) fed methionine, or cirrhotic patients (3) in hepatic coma. Normally, methanethiol is 6 - 20% of the mercaptans excreted. Under fasting conditions in the absence of gastrointestinal bleeding, methane and ethanethiol are approximately twice normal in severe decompensated cirrhosis (10 cases), with the percentage of methanethiol ranging from 6 to 67%; only in the presence of gastrointestinal bleeding was the amount of methanethiol in the breath greater than the amount of ethanethiol, with the methanethiol increasing further several fold. After ingestion of methionine the mercaptans are approximately doubled in the breath of normal persons with little change in cirrhotic patients. The intensity of the pungent odor of the breath of cirrhotic patients after methionine administration was unrelated to the concentration of mercaptans, but was directly related to the concentration of dimethyl sulfide.

5282 CEREBRAL HEMODYNAMICS AND METABOLISM IN HEPATIC CIRRHOSIS: EFFECTS OF PORTACAVAL SHUNT OPERATION. *(E.)* Bianchi Porro, G. (Med. Dept., U. Milan, Italy) and A. T. Maiolo. *Digestion* 3(2):111-121, 1970.

Cerebral hemodynamics and metabolism (mean arterial pressure, blood flow, vascular resistance, glucose and oxygen metabolic rate, respiratory quotient and glucose/oxygen quotient) were compared in patients with hepatic cirrhosis (with and without portacaval anastomosis) and in healthy controls. Cerebral blood flow (ml/100 g/min), vascular resistance (mm Hg/ml/100 g/min), metabolic rate of oxygen (ml/100 g/min), metabolic rate of glucose (mg/100 g/min), mean arterial pressure (mm Hg) and respiratory quotient were within normal range (64.7, 1.62, 3.75, 6.84, 99 and 0.93, resp.) in patients with cirrhosis who did not undergo portacaval anastomosis. Cerebral blood flow, metabolic rate of glucose and metabolic rate of oxygen were increased (97.4, 10.27 and 4.25, resp.), vascular resistance was decreased (1.12) and mean arterial pressure and respiratory quotient were unaltered in cirrhotic patients following portacaval anastomosis. The cerebral glucose/oxygen quotient was increased (2.49) above normal (1.82) following portacaval anastomosis.

5283 HEMOSTATIC STUDIES DURING CLINICAL PIG LIVER PERFUSION. *(E.)* Ro, J. S. (U. Hosp. Oslo, Norway) and A. Flatmark. *Scand J Gastroent* 5(4):315-320, 1970.

Hemostatic studies were performed on a 22-year-old girl with liver cirrhosis and deep hepatic coma who was treated with 2 consecutive pig liver perfusions. The first 4-hr pig liver perfusion was accompanied by administration of 1,250 ml heparinized blood, 125 mg protamine sulfate and platelets from 4 donors. The perfusion stimulated bile production at 90 ml/hr and decreased bilirubin from 10.8 to 6.1 mg/100 ml, and ammonia from 148 to 59 µg/100 ml. The second pig liver perfusion was given 14 hr later, giving similar biochemical improvements, and the following day the patient died. Accumulation of platelets and leukocytes in the livers was observed by microscopic examination of both pig livers and samples of arteria blood and return blood from one perfused liver. During the perfusions, the platelet count dropped by 50 to 60%, from 80,000 to less than 40,000 platelets per µl, and remained at a low level, while leukocytes also dropped from 8,000 to less than 5,000 per µl. Thrombotest levels rose from 12 to 40% during the first perfusion and from 11 to 26% during the second erfusion. The level of activity of factor V in-reased from 25 to 65% during the first perfusion nd from 35 to 45% during the second perfusion, while he activity of factor VIII increased initially and ecreased later in the perfusions. Arterial blood rom the second perfused pig liver had a reduced latelet level of 40,000 per µl at 95 min after start f perfusion, compared with a pre-perfusion level of 8,000 per µl, while return blood from the liver had platelet concentration of 16,000 per µl, Leukocytes ere also reduced from a pre-perfusion value of ,900 per µl in arterial blood to 4,300 at 95 min erfusion time, and a count of 3,600 in return blood.

Gallbladder and Biliary Tract Diseases

5300 EXPERIMENTAL THERAPY OF GALLBLADDER LITHIASIS: PREVENTIVE AND CURATIVE EFFECTS OF VARIOUS DRUGS IN MICE. *(Fr.)* Besancon, F. (Hosp. Lariboisiere, Paris, France), C. Marche, C. Barret and J. Parrot. *Arch France Mal Appar Dig* 59(6):353-376.

The efficacy of drugs which prevent lithiasis and preventive measures in the formation of vesicular lithiasis caused by sodium dehydrocholate were studied in mice. Sodium dehydrocholate (5% solution) was added to a normal diet (666 female nulliparous mice) for a period of 4 months, during which time 33 different drugs were tested as preventive agents. The lithiasis caused in the untreated mice by the dehydrocholate was confirmed in 37 mice at the end of 4 months, and 7 of these animals received a 5% solution of clofibrate in addition to the dehydrocholate. For comparison, 40 mice were given a normal diet, following the 4 months on the lithogenous diet, and they were observed for spontaneous dissolution of the calculi. Clofibrate prevented the formation of the large birefractive cholesterol crystals caused by the dehydrocholate, but did not prevent vesicular distension or some of the lesions, and did not prevent deposits in the liver. The mice responded well, with a negligible mortality (no appearance of lithiasis with continuation of the diet 12 to 20 months), and the efficacy of the clofibrate correlated with the dosage. Results of treatment (either by discontinuation of dehydrocholate, or addition of clofibrate) were seen (microscopically) in a partial dissolution of the lithiasis manifested by changes in the morphology of the biliary crystals (which appeared hollow and residual with polarized light). In the liver, the birefractive cholesterol crystals only disappeared at the end of the lithogenous diet.

5301 PLASMA LECITHIN-CHOLESTEROL ACYLTRANSFERASE IN OBSTRUCTIVE JAUNDICE. *(E.)* Gjone, E. (U. Hosp., Oslo, Norway) and J. P. Blomhoff. *Scand J Gastroent* 5(4):305-308, 1970.

Lecithin-cholesterol acyltransferase activity (% free cholesterol esterified/hr) in plasma from patients with obstructive jaundice was compared with that in normal controls. Activity was reduced to 0.14 from the normal value (3.07) in patients with obstructive jaundice. Dilution experiments (100, 90, 75, 50, 25 and 0% normal plasma added to jaundiced plasma) with and without deactivating lecithin-cholesteral acyltransferase closely resembled each other indicating that marked lecithin-cholesterol acyltransferase inhibition cannot explain the low activities observed in jaundiced patients. Bile salts (taurocholic or glycocholic acid) reduced lecithin-cholesterol acyltransferase activity in normal plasma only at concentrations (1.6 mg/ml) above those found in jaundiced sera indicating that bile salts alone cannot be responsible for the low enzyme activity in obstructive jaundice.

5302 MORPHOLOGICAL-FUNCTIONAL CHANGES IN THE GALLBLADDER IN THE COURSE OF HEPATOPATHIES. *(Ger.)* Stoenescu, R. (Physiol. Inst., Acad. Rumanian S.R., Bucarest), S. Schiau and P. Stoiculescu. *Radiologie* 10(1):42-45, 1970.

The morphological-functional changes in the gallbladders of 104 patients with chronic hepatitis (67) or cirrhosis (37) were examined by volumetric serial cystography. Negative cholecystographies were found in 6% of the control group (900 hospitalized patients without organic digestive complaint), 9% of the hepatitis patients, and 38% of the cirrhotics; filling of the gallbladder was diminished in 9, 19.5 and 35%, resp. An increased incidence of normokinetic gallbladder (control 56%, hepatitis 68.5%) and unchanged hyperkinesia were seen in the hepatitis group. The incidence of hypokinesia in the control and hepatitis groups was 41 and 27.8%, resp. In the cirrhosis cases, the hypokinesias fell to 14.3% while the hyperkinesias were 21% (control 3%). These morphological and functional changes apparently develop parallel to the liver parenchymal damage.

5331 COLONIC PREPARATION: A CONTROLLED TRIAL OF DULCODOS, DULCOLAX AND SENOKOT DX. *(E.)* Sanders, R. C. (Churchill Hosp., Oxford, England) and F. W. Wright. *Brit J Radiol* 43(508):245-247, 1970.

A double-blind study of the laxative action and side effects of Dulcodos (100 mg dioctyl Na sulfosuccinate), Dulcolax (5 mg bisacodyl) and Senokot DX (14 mg of sennosides A and B) was conducted in 450 sequential out-patients scheduled for barium enema or i.v. pyelogram, and allocated on a randomized sequence to one of the three preparations. The patients took 2 laxative tablets on the 2 evenings preceeding X-ray examination, and on the day of examination, an abdominal radiograph was taken before a cleansing enema was given. Prior to the barium enema, a colon washout with 3 pints of water containing 10 mg Dihydroxyphenylisatin was performed and the quantity of feces removed was recorded. The preliminary abdominal radiographs for both barium enemas and IV pyelograms were reviewed to evaluate the presence of feces or pathology. Only 308 patients were evaluated, and the plain films revealed no significant difference between the three preparations either for gas or feces. Out of the 104 subjects receiving Senokot DX, 45 (43%) were clear of feces and 59 (55%) were clear of gas. One-hundred and two patients received Dulcolax and 35 (34%) were clear of feces and 50 (49%) were clear of gas. Out of the 102 patients receiving Dulcodos, 41 (40%) were clear of feces and 59 (58%) were clear of gas. Overall, Senokot DX and Dulcodos were slightly superior to Dulcolax for bowel preparation for radiologic examination, but they produced slightly more side effects (vomiting, gripping pain, nausea, and dizziness) than Dulcolax. Forty percent of the patients were clear of feces on the radiographs taken after laxative preparation; however, 40% were too severely contaminated for performance of the barium enema without a preliminary colon washout. The colon washout seemingly can be eliminated when the radiograph shows the absence of feces.

GENERAL

Parasitology

5397 NON-SUPPURATIVE HEPATITIS IN AMEBIASIS. *(Fr.)* Doxiadis, T. (Athens, Greece) and . Moschoutis. *Ann Gastroent Hepat Hotel Dieu* 6(2): 11-121, 1970.

The effect of amebiasis on the liver was investigated y radiography with the object of establishing a reliable method for the diagnosis of liver involvement n this disease. The radiography was taken in the patient's upright position after a full inspiration on a 36 x 43 plate. Of 10,453 patients examined by this method, 1735 (16.6%) revealed a non-suppurative hepatitis, with amebiasis the causative factor in 940 (9%) of these patients. The characteristics of this was raised in 77.5% of the cases (over 100U), and returned to normal in the same cases that showed a diminution in liver volume after treatment with anti-amebiasis medication (emetine or chloroquine). Thus, the combination of radiography with the ornithine were: a homogeneous density of the liver shadow and of the spleen; a marked elevation of the right hemidiaphragm; and a more extended shadow of the liver in the lower portion than is found in normals. A subsequent study in 100 normal subjects and 142 patients included liver function testing and parasitological examinations in addition to radiography. The biochemical tests included flocculations, transaminases, bilirubin, BSP, and ornithine carbamyl transferase. All these tests were negative except for the last, which carbamyl transferase test, together with a clinical test based on diuresis after treatment, are of important diagnostic value in non-suppurative hepatitis in amebiasis.

5398 POINTS OF CLINICAL IMPORTANCE IN AMEBIASIS, LEISHMANIASIS AND TRYPANOSOMIASIS. *(E.)* Walters, J. (no affil). *Trans Roy Soc Trop Med Hyg* 64(2):220-222, 1970.

5399 ASCARID ABSCESS OF THE LIVER. *(E.)* James, T. (Pinelanos, Cape Province, South Africa). *Med Proc* 16(8):127-130, 1970.

5400 THE IMPORTANCE OF BILIARY-CYSTIC COMMUNICATIONS IN SURGERY FOR HEPATIC HYDATIDOSIS. *(E.)* Beltran de Heredia, J. (Dept. Surg., U. Valladolid, Spain) and T. Sanz Sanz. *Int Surg* 53(6): 393-403, 1970.

5401 THE TREATMENT OF HYDATID CYSTS OF THE LIVER WHICH ARE OPEN TO THE BILIARY TRACT. *(Fr.)* Goinard, P. (Lyon, France), G. Pelissier, R. Streichenberger, B. Chavent and J. Bomel. *Lyon Chir* 66(1):52-53, 1970.

5402 BILIARY TYPE HYDATID CYST IN THE RIGHT LOBE OF THE LIVER (LAPAROSCOPY, GAMMAGRAPHY, SELECTIVE ARTERIOGRAPHY). *(Fr.)* Crismer, R. (Liege, Belgium), J. Naome, M. Delforge, A. Van De Berg, F. Lefebvre and C. Rogister. *Rev Med Liege* 25(1):10-14, 1970.

5403 CORRELATION OF CLINICAL, PARASITOLOGICAL, AND SEROLOGICAL DATA OF INDIVIDUALS INFECTED WITH *ENTAMEBA HISTOLYTICA*. *(E.)* Kotcher, E. (Louisiana St. U. Med. Ctr., Shreveport), M. Miranda and V. Garcia De Salgado. *Gastroenterology* 58(3): 388-391, 1970.

5404 CIRCADIAN MIGRATION OF *HYMENOLEPIS* (CESTODA) IN THE INTESTINE: I. OBSERVATIONS ON *H. DIMINUTA* IN THE RAT. *(E.)* Chappell, L. H. (Rice U., Houston, Tex.), H. P. Arai, S. C. Dike and C. P. Read. *Comp Biochem Physiol* 34(1):31-46, 1970.

DESCRIPTION OF INDEXES

SUBJECT and AUTHOR INDEXES for Gastroenterology Abstracts and Citations, Volume 5, are produced from on-line computer print-out of key-punched cards.

The SUBJECT INDEX is based on a hierarchial system of classification in which *major index terms* are modified by one or more *key word descriptors*. The *key word descriptors* are listed in decreasing order of importance and describe the content of the abstract or citation. In addition, in this indexing system, some *key word descriptors* will also be used as *major index terms*, thus providing in-depth indexing of each document. An abstract or citation number, in brackets, will be found after the *key word descriptors*. Abstracts will be identified by an asterisk outside of the brackets.

An illustrative example of this indexing system follows:

INTESTINE, LARGE

Colon, Carcinoma, Radiological Detection, Rectum (0188)*

COLON

Cancer, Polyps, Radiological Detection (0188)*

RECTUM

Cancer, Polyps, Precancerous (0188)*

CANCER

Large Intestine, Detection, Radiology (0188)*

DIAGNOSIS

Radiology, Cancer, Large Intestine (0188)*

Numbers followed by an asterisk refer to abstracts in the text. Other numbers refer to citations.

SUBJECT INDEX

- ABDOMEN
  - ACUTE, PAIN, PANCREATITIS, CHOLELITHIASIS, PYRAZOLONE DERIVATIVE, SPASMOLYTIC, INTOXICATION (5369)
  - ANGIOGRAPHY (4931)
  - ANGIOGRAPHY, GASTROINTESTINAL HEMORRHAGE, AORTA, CAVOGRAPHY, PATHOMORPHISM, BARIUM, GALLBLADDER (4949)
  - AORTOGRAPHY, SURGERY (5359)
  - APOPLEXY, HEMORRHAGE (5387)
  - DIAPHRAGMATIC HERNIA, CYANOSIS, NEONATE, CONGENITAL (5049)
  - FIBRODYSPLASIA, POLYPOSIS COLI, SURGERY (5100)
  - HODGKIN'S DISEASE, SURGERY, DIAGNOSIS (4911)
  - INTESTINAL OCCLUSION, ADHESIONS, INTRAPERITONEAL ABSCESS (5334)
  - PAIN, LYMPHOMA, JEJUNAL MUCOSA, ALPHA GLOBULIN (5346)
  - PAIN, PANCREATITIS, BILIARY LITHIASIS, AMYLASE, LIPASE (5153)
  - PAIN, PANCREATITIS, PANCREATIC CARCINOMA, PSEUDOCYST, TRAUMA, ABSCESS (5144)
  - TERATOMA, INFANT, RADIOLOGY (4914)
  - TRAUMA, LAPAROSCOPY, PERITONEAL HEMORRHAGE, SCINTIGRAPHY, PERFORATION, SURGERY, HEMATOMA (4909)
  - TRAUMA, LIVER, SMALL BOWEL, STOMACH, PANCREAS (5390)
  - TRAUMA, RADIOLOGY, CHILDREN (4920)
- ABSCESS
  - APPENDIX, HERNIA (5113)
  - COLON, SURGERY, HEALING (5101)
  - LIVER, ASCARIS (5399)
  - LIVER, SURGERY (5208)
- ABSORPTION
  - BILE, EXCRETION, CARDIOGLYCOSIDE (4479)*
  - CALCIUM, SMALL INTESTINE, VITAMIN D3, STRONTIUM (4775)
  - CARBOHYDRATE, MEMBRANE PERMEABILITY, DIARRHEA (4870)*
  - COBALT, INTESTINE, CIRRHOSIS, HEMOCHROMATOSIS (5072)*
  - FAT, DIGESTION, ENZYME (4773)
  - GLUCOSE, GASTRIC RESECTION, ILEUM, VITAMIN B12, PERISTALSIS, MALIGNANT TUMOR (5083)
  - ILEUM, SALT LOADING, CAT (4783)
  - INTESTINAL, MUCOSA, TANNIC ACID, GLUCOSE, BUTYRIC ACID, METHIONINE, MOUSE (4780)
  - INTESTINE, BLOOD FLOW, WATER (4774)
  - INTESTINE, IRON, REGULATION, FERRITIN (4755)*
  - INTESTINE, LIVER, VITAMIN B12, WHOLE BODY SCANNING, RADIOACTIVE COBALT (5075)*
  - INTESTINE, PROTEIN, ENZYME (4767)
  - INTESTINE, SODIUM, SUGAR (4771)
  - INTESTINE, TETRACYCLINE, RAT (4778)
  - INTESTINE, ZOLLINGER-ELLISON SYNDROME, GASTRIC SECRETION (5380)
  - LACTOSE, IRON UTILIZATION, MANNITOL, BLOOD CORPUSCLES, RAT (4763)
  - LIPID, SMALL INTESTINE, BLOOD SUPPLY, MICELLE (4766)*
  - PROTEIN, DIGESTION, MAN (4768), (4769)
  - SMALL INTESTINE, PREGNANCY, LACTATION (4753)
  - SMALL INTESTINE, PROTEIN, CARBOHYDRATE, FAT, CHOLECYSTOJEJUNOSTOMY (4764)*
  - SMALL INTESTINE, SUGAR, WATER (4784)
  - SMALL INTESTINE, WATER, CHLORIDE, SODIUM, GLUCOSE, HYPOPHYSECTOMY, RAT (4756)*
  - THIAMINE, PANCREAS, THIAMINE PYROPHOSPHOKINASE, PHOSPHORYLATION, INTESTINAL TRANSKETOLASE (5143)
  - TRANSPERITONEAL EXCHANGE, OSMOSIS, HYPEROSMOLARITY, GLUCOSE INFUSION (4758)*
  - VITAMIN K1, GASTROINTESTINAL ABSORPTION, RADIOISOTOPES TRACING, URINE, FECES, PLASMA (4757)*
  - WATER, ILEUM, ELECTROLYTE, ATPASE, ULTRASTRUCTURE (4713)*
- ACHALASIA
  - CARDIA, ESOPHAGUS, SURGERY (4972)
  - CARDIAC, PYLORIC SPASM, STOMACH DILATATION, SURGERY, CARDIOMYOTOMY, PYLOROPLASTY, CHILDREN (4963)
- ACID-BASE
  - ACIDITY, STOMACH, GASTRIN, PENTAGASTRIN, MOTILITY, ANTRAL MUCOSA (4808)
  - ALKALOID, LIVER, TOXICITY, RAT (5239)
  - REDOX CHANGES, LIVER, CYTOCHROME P-450, OXYGEN ACTIVATION, ENDOPLASMIC RETICULUM, RABBIT (4822)*
  - RESPIRATORY ALKALOSIS, LIVER, CIRRHOSIS, RENAL DISEASE, HYPERAMMONIEMIA, HYPONATREMIA (5292)
  - STOMACH, SECRETION, DUODENAL ULCER (5033)
  - URIC ACID, STOMACH ACID SECRETION, TRANSPORT, MUCOSA (4761)*
- ACTINOMYCIN
  - D, ENZYME, CYCLOHEXAMIDE, INTESTINE, EPITHELIAL CELLS (4692)*
  - RNA SYNTHESIS, RAT LIVER CHROMATIN, CORTISOL, RNA POLYMERASE (4710)*
- ADRENAL
  - ADRENALECTOMY, LIVER, RADIATION TOXICITY, HEAVY POLYRIBOSOMES, LIVER REGENERATION, RAT (4823)*
  - MICROSOME, MONO-OXYGENASE, LIVER, GUINEA PIG (4732)
- ALCOHOL
  - ALCOHOLIC CIRRHOSIS, PANCREATIC FUNCTION, AMYLASE, LIPASE, PANCREOZYMIN (5278)
  - ALCOHOLISM, FATTY LIVER, PARENCHYMAL DAMAGE, SILYMARIN, BLOOD CHEMISTRY (5165)
  - ALCOHOLISM, LIPID METABOLISM, MAIZE OIL, UNSATURATED FATTY ACIDS, LIVER MITOCHONDRIA (5234)
  - ALCOHOLISM, PANCREATITIS, DIABETES (5157)
  - ALLYL, HEPATIC PELIOSIS, HEPATIC ENZYMES, RATS, LDH, TRANSAMINASE (5174)*
  - ALLYL, LIVER, PROTECTION, BSP TEST, STATISTICAL EVALUATION, RAT (4895)

- CHLORETHANOL, LIVER TOXICITY, GROWTH, CHLORHYDRIN, RAT (5231)
- CHRONIC ALCOHOLISM, FOLIC ACID, URINE, LIVER BIOPSY, MALABSORPTION (5074)
- CHRONIC GASTRITIS, GASTRIC MUCOSA (4978)
- CONGENERS, FUSEL OIL, LIVER, PARENCHYMAL DAMAGE, STEATOSIS, NECROSIS, TUMORS (5226)
- FAT, LIVER, CIRRHOSIS (5235)
- GASTRIC MUCOSA, BLOOD FLOW, ASPIRIN (5382)
- GLYCEROL, LIVER, ENZYME, TROUT (4846)
- LIPID METABOLISM, INSULINEMIA, GLYCEMIA, CHOLESTEROL, ELECTROPHORESIS, CHYLOMICRONS (5227)
- LIVER, CIRRHOSIS, LIPID (5246)
- LIVER, CIRRHOSIS, NECROSIS, HEMODYNAMICS, STEATOSIS (5295)
- LIVER, FAT, DIET (5236)
- LIVER DAMAGE, UROBILINOGENURIA, CIRRHOSIS, FATTY LIVER, HEPATOMEGALY, POLYNEUROPATHY (5224)
- LIVER MITOCHONDRIA, PERMEABILITY, FRAGILITY, CHOLINE DEFICIENCY, SUCCINIC DEHYDROGENASE (5221)•
- RETICULOENDOTHELIAL SYSTEM, ABSORPTION, STEATOSIS, INTOXICATION, RAT (5233)

AMINO ACID
- ARGININE, ORNITHINE, HEPATITIS, CIRRHOSIS, RADIATION (5197)
- GLYCINE, TRANSPORT, SMALL INTESTINE, SODIUM, BIRD (4776)
- HEPATIC INCORPORATION, POLYRIBOSOMES, ATP, ASSAY, ISOLATION (4712)•
- HYPOGLYCIN, TOXICITY, METABOLISM (5249)
- LEUCINE, LYSINE, REGENERATION, LIVER, RADIATION, PROTEIN (4826)•
- LIVER, DEHYDROGENASES, PROTEIN CATABOLISM, HEPATIC ENZYMES (4818)•
- LIVER, PROTEIN SYNTHESIS, CORTISOL TREATMENT, IN VIVO, IN VITRO, RAT (4834)•
- METABOLISM, LIVER, SPLEEN (4847)
- METHIONINE, DEFICIENCY, RAT EMBRYO, PANCREAS, ULTRASTRUCTURE, ENZYME ACTIVITY (4701)•
- PEPSIN, GASTRICSIN, HUMAN (4810)
- THREONINE DEFICIENCY, ENZYME, LIVER (4694)•

AMMONIA
- AMMONIEMIA, HEPATIC COMA, BLOOD PLATELETS, HETEROLOGOUS PERFUSION (5215)
- AMMONIEMIA, HEPATIC COMA, FLAPPING TREMOS, HEMORRHAGE (5217)
- HYPERAMMONEMIA, GASTRECTOMY, TRANSHEPATIC SHUNT, HEPATIC LESIONS (4950)
- HYPERAMMONIEMIA, LIVER, CIRRHOSIS, RENAL DISEASE, RESPIRATORY ALKALOSIS (5292)
- UREA, GASTROENTERITIS, ELECTROLYTE (5385)

AMPULLA OF VATER
- STENOSIS, SPHINCTERECTOMY, GALLBLADDER (4999)

ANALGESIC
- ASPIRIN, STOMACH, MUCOSA, BLOOD FLOW, ALCOHOL (5382)
- PANCREATITIS, CHOLELITHIASIS, ACUTE ABDOMINAL PAIN, SPASMOLYTICS, PYRAZOLONE DERIVITIVE (5369)

ANAPHYLAXIS
- ANTIGEN, ILEUM, GUINEA-PIG (5053)

ANASTOMOSIS
- BILE DUCT, CYST, ATRESIA, JAUNDICE (5327)
- BILIARY-JEJUNAL BYPASS, PANCREATIC LESIONS, STENOSIS, CALCULI (5300)•
- CHOLECYSTOJEJUNOSTOMY, INTESTINAL ABSORPTION, PROTEIN, CARBOHYDRATE, FAT (4764)•
- CHRONIC PANCREATITIS, BILE DUCT, THORACIC SYMPATHECTOMY, SPLANCHIECTOMY (5162)
- CHRONIC PANCREATITIS, BILIARY LITHIASIS, WIRSUNG'S CANAL, CHOLANGIOGRAPHY (5151)
- ESOPHAGEAL, MOTILITY, HEMORRHAGE, ARTIFICIAL ESOPHAGUS (4964)
- ESOPHAGUS, ATRESIA, LIPIODOL, BARIUM-OXIDE, RADIOLOGY (4956)
- OESOGASTRIC, GASTRECTOMY, METALLIC CLIP, P.K.S. 25, TERMINOLATERAL TECHNIQUE (5350)
- P.K.S. 25, ESOINTESTINAL, HEMICOLECTOMY, ILEO-TRANSVERSE (5364)
- PANCREATIC CANCER, METASTASES, BIOPSY (5141)
- PANCREATIC CYSTS, DRAINAGE, ANASTOMOSIS, PRESSURE (5139)
- PORTACAVAL, CIRRHOSIS (5297)
- PORTACAVAL, LIVER CIRRHOSIS, HEMMORHAGE, PROGNOSIS (4940)
- POSTOPERATIVE RECTOCOLITIS, PROGNOSIS, MORTALITY RATE (5123)
- RECTUM, TRIGONE (4867)

ANEMIA
- APLASTIC, HEMORRHAGE, GASTROINTESTINAL TRACT, HEPATITIS, PANCYTOPENIA (5266)
- BIAFRAN CHILDREN, MALNUTRITION, LIVER, SPLEEN, CARDIOPATHY (5340)
- GASTRIC, ADENOCARCINOMA, OSTEMEDULLARY BIOPSY, HEMOPATHIC, YOUNG ADULT (5016)
- ICTERUS, CHOLANGITIS, LIVER (4919)
- NORMOCHRONIC, MULTIPLE MYELOMA LIVER, KAHLER'S DISEASE, PROTEINURIA, PROTEINEMIA (5275)
- PENICIDUS, GASTRITIS, IMMUNOLOGY, ANTIBODIES, MUCOSA, INTRINSIC FACTOR (5005)

ANESTHESIA
- ESOPHAGUS, STOMACH, ULCER, DIAGNOSIS (4953)
- HALOTHANE, EXPOSURE, LIVER, SULFOBROMOPHTHALEIN, CLEARANCE, RAT (5223)•
- TOXICITY, LIVER, SURGERY (5244)
- TRACHIAL INTUBATION, PERFORATION, CERVICAL ESOPHAGUS, EMPHYSEMA (4975)
- BLOOD FLOW, LIVER (5376)

ANOMALY
- CONGENITAL, ANUS, RECTUM, SPHINCTER, SURGERY (5093)
- CONGENITAL, RECTUM, DUPLICATION, SURGERY (5108)
- GALLBLADDER, DUPLICATION, CONGENITAL, CHOLECYSTOGRAPHY (5313)
- GALLBLADDER, MULTISEPTATE, EMBRYOGENESIS (5316)
- HIRSCHPRUNG DISEASE, MALROTATION, PERITONITIS, ATRESIA, NEONATE, DIAPHRAGM (5058)
- MALROTATION, DUODENUM, ATRESIA, STENOSIS (5013)

ANTIBIOTIC
- COLON, SURGERY, CARCINOMA (5118)
- EMETINE, LIVER, DRUG METABOLIZING ENZYME (4708)*
- ENTERITIS, DIARRHEA, NEONATE (5371)
- PENICILLIN, SURGERY, COLON, BACTERIA (4881)
- PERITONITIS, DUODENAL FISTULA, DRAINAGE, PROTEASE INHIBITORS, BILLROTH RESECTION (4983)
- PROTEIN SYNTHESIS, INHIBITION, HEPATECTOMY, DNA REPLICATION, CYCLOHEXAMIDE, PACTAMYCIN, SPARSOMYCIN (4831)*
- TETRACYCLIN, INTESTINE, ABSORPTION, RAT (4778)
- TETRECYCLINE, PANCREAS, LIPASE (4814)

ANTIBODY
- ISO, ANTI-COLON, DIGESTIVE GROUP, AUTO-IMMUNE, HUMAN (5126)
- ULCERATIVE COLITIS, HYPERSENSITIVITY, DNA, SALAZOPYRINE, TISSUE DAMAGE, AUTOLOGOUS LEUCOCYTES (5132)
- VIRUS-SPECIFIC, CHRONIC HEPATITIS, IMMUNOSUPPRESSIVES, CIRRHOSIS, ACUTE INTOXICATION (5247)

ANTIGEN
- AUSTRALIA, HEPATITIS (5272)
- AUSTRALIA, HISTORY, HEPATITIS (5270)
- AUSTRALIA, HEPATITIS, VIRAL (5268)
- ENTAMEBA, SEROLOGY (5403)
- HEPATITIS, IMMUNOELECTROPHORESIS, OUCHTERLONY TECHNIQUE, SERUM PROTEIN, BLOOD TRANSFUSION (4945)
- ILEUM, ANAPHYLAXIS, GUINEA-PIG (5053)
- PROTEIN, IMMUNOLOGY, CHOLERA (5107)
- SERUM HEPATITIS, INFECTIOUS HEPATITIS (5253)*

ANTISEROTONIN
- DUMPING SYNDROME, GASTROENTEROSTOMY, PEPTIC ULCER, GASTRECTOMY METHYSERGIDE (5079)

ANUS
- ANATOMY, SURGERY, RECTUM (4729)
- DEFECATION, COLON, RECTUM (4802)
- MALFORMATION, SPHINCTER, SURGERY, CLOACAL PARTITION (5093)
- PROLAPSE, ULCERATIVE COLITIS, INTESTINAL COMPLICATIONS, LIVER, EYES, ABSCESS (5130)
- SPHINCTER, INCONTINENCE, SURGERY, FASCIA PLASTIC, GRACILIS MUSCLE (4968)

APPENDIX
- ABSCESS, HERNIA (5113)
- APPENDOECTOMY, TOTAL (5120)
- APPENDICITIS, GAS GANGRENE, PERFORATION, FATAL, DRAINAGE (5097)
- APPENDICITIS, PREGNANCY, OVARIAN SURGERY, PROGESTERONE, LABOR, ABORTION, ILEUS (5092)
- CROHN'S DISEASE, REGIONAL ENTERITIS (5067)
- DIVERTICULITIS, APPENDICITIS, SURGERY (5103)
- ENDOMETRIOSIS, SURGERY (5104)

ARTHRITIS
- AMYLOIDOSIS, HEPATIC, REGRESSION, RENAL CANCER, NEPHRECTOMY, MUCOPROTEINS, LIVER BIOPSY (5185)
- POLY, CHRONIC, GOLD TREATMENT, CHOLESTASIS, MUCOSA, REVERSIBLE CHANGES, AURO-DETOXIN (5194)
- RHEUMATOID, LIVER, PATHOLOGY, SJOGREN'S SYNDROME (5206)

ASCITES
- HEPATIC, ALBUMIN, PORTAL HYPERTENSION, HYPOVOLEMIA, DIURETICS, SPIROLACTONE (5279)

BACTERIA
- CHOLERA, FOWL, IMMUNOLOGY (5363)
- CLOSTRIDIUM, PERFRINGENS, INTESTINE, IMMUNOLOGY, LAMB (5396)
- CLOSTRIDIUM, PERFRINGENS, SMALL INTESTINE, FOOD POISONING, DIARRHEA (4884)
- ELECTRON MICROSCOPY, ALIMENTARY TRACT, INSECT (4876)
- IMMUNOLOGY, CHOLERA, FOWL (5362)
- INFECTION, BILIARY TRACT, AMPICILLINE, JAUNDICE (5323)
- SALMONELLA, EXCRETION, STRESS, PIG (5357)
- SALMONELLA, TYPHOID, PARATYPHOID, ANTIBIOTICS, ELECTROLYTES (5333)

BILE
- ACID, CONCENTRATION, SERUM, INFECTIOUS HEPATITIS (5254)*
- ACID, CIRCADIAN RHYTHYM, ENDOCRINE FACTOR, RIBOSOMAL PROTEIN, CHOLESTEROL-7-ALPHA-HYDROXYLASE (4853)
- ACID, LIVER, JAUNDICE, HEPATIC COMA, HEMOLYTIC TOXINS (5256)
- CORTICOSTERONE METABOLISM, SEX DIFFERENTIATION, RAT (4854)*
- DIET, CHOLESTEROL, GALLSTONE (5314)
- EXCRETION, ABSORPTION, CARDIOGLYCOSIDE (4779)*
- FLOW, BODY TEMPERATURE, SKF-525-A, EXCRETION, INDOCYANINE GREEN (4860)*
- HEMOBILIA, TUMOR, TRAUMA (5303)
- HEMOBILIA, TUMOR, TRAUMA, ETIOLOGY (5303)
- LIVER, CHOLANGITIS, SCLEROSIS (5307)
- SECRETION, VIRAL HEPATITIS, VEDRENAN, CHOLERETIC, CIRRHOSIS, MIGRAINE, LITHIASIS (5172)
- STONES, GALLBLADDER, ULTRASONIC DETECTION (4893)*
- ATRESIA, OBSTRICTIVE JAUNDICE, CIRRHOSIS, CHOLESTYRAMINE (5218)

BILE DUCT
- APT, ATRESIA, ANASTOMOSIS, JAUNDICE (5327)

  - BILIARY-JEJUNAL BYPASS, SURGICAL TECHNIQUE, JEJUNUM (5300)*
  - CANCER, ULCERATIVE COLITIS (5315)
  - CHOLESTASIS, PHOSPHOLOIPID, LIPOPROTEIN, ANTIGEN, ALBUMIN (5310)
  - CHOLESTASIS, RECURRENT, INTRAHEPATIC, JAUNDICE, MITOCHONDRIAL FLUORESCENCE (5195)
  - COMMON, EPITHELIUM, ELECTRON MICROSCOPE (4752)
  - CONCREMENT, LIVER, RUTIN, INFLAMMATION, SIDE EFFECT (5228)
  - CYST, DUODENUM, STONE (5318)
  - LIVER, DIGESTIVE TRACT, CHOLELITHIASIS, MIGRAINE, DYSKINESIA (5343)
  - RADIOLOGY, CHOLANGIOCHOLECYSTOGRAPHY (4917)
  - RADIOLOGY, ORAL, INTRAVENOUS, SURGICAL, CHOLECYSTOGRAPHY, CHOLANGIOGRAPHY (4906)
  - STASIS, LIVER TUMOR, METASTASES, ECHINOCOCCOSIS (5407)
- BILIARY TRACT
  - BACTERIAL INFECTION, METAMPICILLINE, JAUNDICE, LITHIASIS, AMPICILLINE, ELIMINATION (5323)
  - CHOLESTASIS, GOLD TREATMENT, ALLERGY, RHEUMATOID ARTHRITIS, MUCOSA, REVERSIBLE CHANGES, AURO-DETOXIN (5194)
  - CHOLESTASIS, JAUNDICE, SURGERY, HEPATITIS (5179)
  - CHOLESTASIS, LIPOPROTEIN, PHOSPHOLIPID, ANTISERUM, ANTIGEN, ALBUMIN (5310)
  - CHOLESTASIS, RECURRENT, INTRAHEPATIC, JAUNDICE (5195)
  - GALLBLADDER, CONTRACTION, OCTAPEPTIDE, CHOLECYSTOKININ (4794)*
  - HYDATIDOSIS, LIVER, SURGERY (5400)
  - MEXASE, COLON, PANCREATITIS (5356)
  - OBSTRUCTION, CHOLESTASIS, CYTOMEGALIC INCLUSION, NEONATE, HEPATITIS, JAUNDICE, HYPERLIPEMIA (5190)
  - OBSTRUCTION, DUODENUM, DIVERTICULUM (5317)
  - PANCREATIC CYST, RADIOLOGY, GASTROINTESTINAL TRACT, JAUNDICE, SURGERY, DRAINAGE (5140)
  - PANCREATITIS, PERFORATION, PERITONITIS, NECROSIS (5149)
  - SURGERY, BIOLOGICAL GLUE (5312)
  - SURGERY, GALLBLADDER, LIVER (5308)
- BILIRUBIN
  - CARBON MONOXIDE, HEME CATABOLISM, RAT (4825)*
  - CONJUGATION, LIVER, HUMAN, RAT (4844)*
  - HYPERBILIRUBINEMIA, CONGENITAL, LIVER, GILBERT'S SYNDROME (5205)
  - HYPERBILIRUBINEMIA, NEONATE, LUMINAL TREATMENT (5220)
  - LIVER, MITOCHONDRIA, METABOLISM (5241)
  - PROTEIN BINDING, SERUM ALBUMIN, HUMAN, BOVINE, OPTICAL DENSITY (4859)
  - SECRETION, LIVER, SHEEP (4781)
  - SERUM, ASSAY, SPECTROPHOTOMETRY (4849)
- BIOPSY
  - LIVER, MENGHINI, LEUKEMIA, LAPAROTOMY, HEMORRHAGE, SHOCK (5344)
- BLOOD VESSEL
  - MESENTERIC ARTERY, HYPERVASCULARIZATION, CROHN'S DISEASE, ANGIOGRAPHY (5066)
  - MESENTERIC ARTERY, OCCLUSION, EMBOLECTOMY (5332)
- CALCULUS
  - CONCREMENT, LIVER, ANIMAL STUDY, RUTIN, BILE DUCT (5228)
  - CYST, BILE DUCT, DUODENUM (5318)
  - DUODENUM, DIVERTICULUM, PERFORATION (4997)
  - GALLBLADDER, AGE FACTOR, NUTRITION, GALLBLADDER PERFORATION, SEX FACTOR (5325)
  - GALLBLADDER, BILE, DIET, CHOLESTEROL (5314)
  - GALLBLADDER, CHOLECYSTOGRAPHY (4918)
  - GALLBLADDER, ICTERUS, CARCINOMA, DIAGNOSIS (5306)
  - GALLBLADDER, ILEUS (5047)
  - GALLBLADDER, ILEUS, SURGERY (5054)
  - GALLBLADDER, OBSTRUCTION, DUODENUM (5330)
  - GALLBLADDER, X-RAY, ORAL TRIJOBIL, I.V. CYSTOGRAPHY, STOMACH, DUODENUM, SEX DIFFERENCE (5041)*
  - GALLSTONES, PANCREATITIS, SURGERY, NECROTIC LESION, PERITONEAL DIALYSIS (5152)
  - RECTUM, MILK OF MAGNESIA (5098)
- CANCER
  - ACUTE LEUKEMIA, LIVER BIOPSY, SHOCK, HEMORRHAGE, MENGHINI (5344)
  - BILE DUCT, ULCERATIVE COLITIS (5315)
  - COLON, SURGERY (5107)
  - DIAGNOSIS, STOMACH, INTESTINE, POLYPS, RADIOLOGY, ENDOSCOPY (5365)
  - EARLY MANIFESTATION, STOMACH, ULCER, POLYP, INTESTINE (5367)
  - HEMORRHAGE, ULCER, SURGERY (5372)
  - LUNG, JEJUNUM (5043)
  - MEDIASTINAL TUMOR, ESOPHAGUS, RADIOLOGY, EPITHELIOMA (4962)
  - METASTASES, LIVER, GAMMA-GLUTAMYLTRANSPEPTIDASE, ALKALINE PHOSPHATASE, OBSTRUCTIVE JAUNDICE (4936)
  - NEOPLASTIC, POLYP, STOMACH, PYLORIC ANTRUM, MUCOSA, SUBMUCOSA (5006)
  - METASTASES, COLON, RECTUM, LIVER, CHEMOTHERAPY (5198)
  - PANCREATIC, METASTASES, ANASTOMOSIS, BIOPSY (5141)
  - PRIMARY, LIVER, DIAGNOSIS (5183)
  - PROSTATIC, RECTAL OCCLUSION, EPITHELIOMA, DYSURIA, ESTROGEN THERAPY (5111)
  - RECTUM, COLON, RADIATION THERAPY (5112)
  - RENAL, HEPATIC, REGRESSION, MUCOPROTEINS, NEPHRECTOMY, LIVER BIOPSY, AMULOIDOSIS (5185)
  - STOMACH, COLON, THORAX, RADIOGRAPHY (4947)
  - STOMACH, CYTODIAGNOSIS (4890)*
  - STOMACH, DIAGNOSIS, SURGERY (4929)
  - STOMACH, ESOPHAGUS, SURGERY (4928)
  - STOMACH, IMMUNOLOGY (4991)

  - STOMACH, LYMPH NODE, GASTRECTOMY (4979)•
  - STOMACH, RADIOLOGY, DIAGNOSIS (5009)
  - RUMOR, ABDOMINAL, DIAGNOSIS, GAS INSUFFLATION (4897)•

- CARBOHYDRATE
  - ABSORPTION, INTESTINE, GLUCOSE, TANNIC ACID, BUTYRIC ACID, METHIONINE (4780)
  - CARDIOGLYCOSIDE, METABOLISM, ABSORPTION, BILE, EXCRETION (4779)•
  - D-FRUCTOSE, LIVER, METABOLISM (5211)
  - GLUCOSE, INTESTINE, WORM (5404)
  - GLUCOSE, MALABSORPTION, ERYTHROCYTE, MEMBRANE TRANSPORT (5084)
  - GLUCOSE, METABOLISM, LIVER, TOLBUTAMIDE TEST (4916)
  - GLUCOSE, INTESTINE, WORM (5404)
  - GLUCOSE, PERFUSION, LIVER, ENZYME, ACTIVITY, RAT (4745)
  - GLYCOGEN SYNTHESIS, BIOTIN DEFICIENCY, DIURNAL CYCLES (4836)•
  - GLYCOGEN SYNTHESIS, LIVER, RADIOACTIVITY, PRECURSOR, GLUCOSE INCORPORATION, MICE, GLUTAMIC ACID (4861)
  - HYPERGLYCEMIA, GASTRECTOMY, HYPERINSULINISM, PREDISPOSITION, DIABETES MELLITUS (4982)
  - LACTOSE, IRON UTILIZATION, MANNITOL, BLOOD CORPUSCLES, RAT (4763)
  - METABOLISM, LIVER, PATHOLOGY (5180)
  - SIMPLE SUGAR, ABSORPTION, SMALL INTESTINE, WATER (4784)
  - SORBITOL, SMALL INTESTINE, RADIOLOGY, DIAGNOSIS (4913)
- CARCINOMA
  - ADENO, STOMACH, HEMOPATHIC, ANEMIA, YOUNG ADULT (5016)
  - COLON, ADENOMA, POLYP (4915)
  - COLON, SURGERY, ANTIBIOTIC (5118)
  - ESOPHAGUS, STENOSIS, PERFORATION, SURGERY (4965)
  - GALLBLADDER, DIAGNOSIS, ICTERUS, GALLSTONE (5306)
  - GALLBLADDER, SURGERY (5309)
  - GASTRIC, FIBROMYOMA, BILLROTH-II-RESECTION, ULCER (4980)
  - LIVER, ANGIOGRAPHY, SPLENOPORTOGRAPHY, ARTERIOGRAPHY (4952)
  - LIVER, METASTASES, ULTRASONIC SCANNING, PARENCHYMAL DAMAGE (4892)•
  - MEDULLARY, THYROID, DIARRHEA, RECTOSCOPY, BRONCHOSCOPY, SURGERY (5341)
  - MICRO, CIRRHOSIS, ESOPHAGEAL VARICES, SURGERY, MORTALITY (4966)
  - PANCREAS, 5-FLUOROURACIL, TELECOBALT (5136)•

DIVERTICULUM
- DIVERTICULITIS, APPENDIX, APPENDICITIS, SURGERY (5103)
- DIVERTICULITIS, COLON, FISTULA (5117)
- DIVERTICULITIS, COLON, SURGERY (5114)
- DIVERTICULOSIS, JEJUNUM, MALABSORPTION, OSTEOMALACIA, RICKETS (5078)
- DIVERTICULITIS, PSEUDO TUMORS, DOUBLE CONTRAST, SIGMOID COLON, STENOSIS, INFLAMMATION (4894)•
- DUODENUM, OBSTRUCTION, BILIARY TRACT (5317)
- DUODENUM, PERFORATION, ENTEROLITH (4997)
- MECKEL'S, INTESTINE, HEMORRHAGE, SURGERY, GASTRIC MUCOSA, SHOCK (5064)
- MECKEL'S, PERFORATION, PERITONITIS, SURGERY, NEWBORN, INTESTINAL OBSTRUCTION (5050)

DRUG
- AMPICILLINE, BILIARY TRACT, BACTERIAL INFECTION, JAUNDICE, LITHIASIS (5323)
- ATROPINE, ILEUM, COLON, RECTUM (4804)
- COLCHICINE, PEPTIDASE, DISACCHARIDASE, SMALL INTESTINE (4711)•
- DIAZEPAM, ENDOSCOPY, GASTROINTESTINAL TRACT (4926)
- DIMETHYL SULFIDE, MERCAPTONS, METHIONINE, CIRRHOSIS (5281)•
- DOGMATIL, DIGESTIVE DISEASES, ANTIDEPRESSANT, PSYCHOTROPIC DRUG, HYPOTHALAMIC CENTER (5335)
- DOGMATIL, SULPHIRIDE, PEPTIC ULCER, HYPOTHALAMIC CENTER (5035)
- DYSENTERY, AMOEBIASIS (5383)
- EUBIOSIS, INTESTINE (5406)
- HEMOSTATIC, PEPTIC ULCER, STOMACH, HEMORRHAGE (5007)
- IMMUNOSUPPRESSIVES, GRANULOMATOUS ILEOCOLITIS, FEVER, LYMPHOID HYPERTROPHY, ULCERATION, CORTICOIDS (5135)
- ISONIZID, HEPATIC LESION, ANTITUBERCULAR ACTIVITY, LUNG TUMOR, RIFAMPICINE (5230)
- METHYSERGIDE, DUMPING SYNDROME, ANTISEROTONIN, GASTRECTOMY, GASTROENTEROSTOMY, ULCER (5079)
- NEMATICIDE, TETRACHLOROTHIOPHENE, PESTICIDE, MICE, SYPHACIA OBVELATA (5408)
- PANCREABIL, L L 505, CHOLERETIC, ANTISPASMODIC, CONSTIPATION, POSTHEPATITIS (5354)
- PENTOBARBITAL, PHENOBARBITAL, HEPATIC ENZYME INDUCTION, REVERSIBILITY, SLEEPING TIME, MICE (4743)
- SILYMARIN, FATTY LIVER, ALCOHOLISM, BLOOD CHEMISTRY, ELECTRON MICROSCOPY, PARENCHYMAL DAMAGE (5165)
- SODIUM OXYFERRISCORBONE, PEPTIC ESOPHAGITIS, ENDOSCOPY, GASTRODUODENAL ULCER, HYPERACIDITY (4958)
- SULFOBROMOPHTHALEIN, BILIARY TRANSPORT, GLUTATHIONE CONJUGATE, BILIARY EXCRETION, HEPATIC UPTAKE (4754)•
- SULFOBROMOPHTHALEIN, CLEARANCE, LIVER, RAT, HALOTHANE EXPOSURE (5223)•
- SULPIRIDE, GASTRODUODENAL ULCER, HEMORRHAGE, ARTERIAL TENSION, DUMPING SYNDROME (5038)
- TRANQUILIZER, ULCER, STOMACH, DUODENUM, GASTRIC SECRETION (5040)

DUODENUM
- ACID, SECRETION, STOMACH (4866)
- ATRESIA, STENOSIS, OCCLUSION, MESENTERY ARTERY, MALROTATION (5013)
- BILLROTH RESECTION, PERITONITIS, ANTIBIOTICS, DUODENAL FISTULA, DRAINAGE, PROTEASE INHIBITORS (4983)
- CARCINOMA (5000)
- CONTRACTION, NICOTINE, STOMACH (4801)
- CYST, BILE DUCT, STONE (5318)
- CYSTIC DYSTROPHY, STENOSIS (5147)
- DIVERTICULUM, BILIARY TRACT, OBSTRUCTION (5317)
- DIVERTICULUM, PERFORATION, ENTEROLITH (4997)
- DUMPING SYNDROME, ILEUM, ION (5080)
- DUODENAL BULB, MUCOSA, STOMACH (5004)
- DYSKINESIA, OBSTRUCTIVE JAUNDICE, ODDI SPHINCTER, RADIOKINETICS (5322)
- FISTULA, TRYPSIN INACTIVATOR, ACUTE PANCREATITIS (4981)
- ILEUM, COLON, MUCOSA, SURGERY (5045)
- ISOLATED, BRADYKININ, PROSTAGLANDIN E1, MOTILITY, RAT (4797)•
- JUICE, AMYLASE, DETERMINATION, AMYLOCLASTIC TECHNIQUE, AUTOANALYZER (4812)
- MUCOSA, EPITHELIUM, ULTRASTRUCTURE, GOLGI APPARATUS, TRACER STUDY (4704)•
- NICOTINE ACTION, CONTRACTILITY, DOG (4793)•
- OBSTRUCTION, GALLSTONE (5330)
- PARAGANGLIOMA, NONCHROMAFFIN (5001)
- STENOSIS, DYSPNEA, CYANOSIS, ATRESIA, EMERGENCY, CHILDREN (5345)
- TRANS-SPHINCTEROTOMY, TECHNIQUE BIOPSY, VATER'S PAPILLA (4944)
- TUMOR, RADIOLOGY, PAPILLOMA, METASTASES (5012)
- ULCER, DOGMATIL, SULPIRIDE (5035)
- ULCER, GASTRECTOMY, PYLOROPLASTY, PANCREAS (4993)
- ULCER, RESECTION, JEJUNAL ULCER, PERITONITIS, VAGOTOMY, DYSTONIA, PAIN, NUTRITION (5025)
- ULCER, GASTRIC RESECTION, PANCREATITIS (5155)

- ULCER, GASTRIC RESECTION, VAGOTOMY, PYLORIC STENOSIS, HYPERSECRETION (4951)
- ULCER, GASTRIC SECRETION, ACID (5033)
- ULCER, GASTRIC SECRETION, HISTAMINE, GASTRIN, PEPSIN (4935)
- ULCER, GASTRIC ULCER, GASTRIC SECRETION, TRANQUILIZER (5040)
- ULCER, MOTILITY, SURGERY (5032)
- ULCER, PERFORATION, PYLOROPLASTY (5028)
- ULCER, SMOKING, STOMACH (5029)
- ULCER, STOMACH, SURGERY (5027)
- ULCER, SURGERY (4899)
- ULCER, SURGERY, ERRORS, SECRETION TEST, VAGOTOMY RESECTION, ACIDITY (5036)
- ULCER, SURGERY, RECURRENCE (5037)
- ULCER, SULPIRIDE, HEMORRHAGE, DUMPING SYNDROME (5038)
- ULCER, VAGOTOMY, PARIETAL CELL MASS (5030)

DYSENTERY
- DRUG, AMOEBIASIS (5383)

DYSPEPSIA
- GASTRIC JUICE, COW'S MILK, CONSTIPATION, DIARRHEA, DEHYDRATION, VEGETABLES (5366)
- L L 505, CHOLERETIC, ANTISPASMODIC, CONSTIPATION, POST-HEPATITIS, MIGRAINE, PANCREABIL (5354)
- LIVER, METASTASES, ALKALINE PHOSPHATASE, LAPAROSCOPY, HYPOCHONDRIUM (5204)

ELECTROLYTE
- CALCIUM, ABSORPTION, INTESTINE, VITAMIN D3, STRONTIUM (4775)
- CALCIUM, MALABSORPTION, CIRRHOSIS (5081)
- GASTROENTERITIS, UREA (5385)
- IRON, ABSORPTION, INTESTINE, REGULATION, FERRITIN (4755)*
- IRON, ACCUMULATION, LIVER, RADIOIRON KINETICS, HEMATOLOGICAL DISEASE, HUMAN-PHANTOM-REMCAL (5251)
- IRON, METABOLISM, IRON-BINDING CAPACITY, HEMOCHROMATOSIS (5071)*
- IRON UTILIZATION, ABSORPTION, LACTOSE, MANNITOL, BLOOD CORPUSCLES, RAT (4763)
- NUTRITION, GASTROENTERITIS (5384)
- OSTEOMALACIA, JEJUNUM, DIVERTICULOSIS, MALABSORPTION, RICKETTS (5078)
- OSTEOMALACIA, PANCREATITIS, BLIND LOOP SYNDROME, MALABSORPTION (5159)
- OSTEOMALACIA, RENAL, CADMIUM, ITAI ITAI DISEASE (5388)
- POTASSIUM CHLORIDE, GASTROINTESTINAL TRACT, GASTRIC PERFORATION, ULCERATION, GASTRIC MUCOSA (4984)
- POTASSIUM CHLORIDE, ULCER, INTESTINE, MUCOSA, STENOSIS (5048)
- RUTIN, CONCREMENT, LIVER, BILE DUCT, SIDE EFFECT, INFLAMMATION, ANIMAL EXPERIMENT (5228)
- SALT LOADING, ILEUM, ABSORPTION, CAT (4783)
- SODIUM, ABSORPTION, INTESTINE, SUGAR (4771)
- SODIUM, SMALL INTESTINE, GLYCINE TRANSPORT, BIRD (4776)

ENDOCRINE SYSTEM
- CIRCADIAN RHYTHM, BILE ACIDS, CHOLESTEROL-7-ALPHA-HYDROXYLASE, RIBONUCLEIC ACIDS, RIBOSOMAL PROTEINS (4853)
- HYPOPHYSECTOMY, NUCLEIC ACIDS, ZINC, MANGANESE, LIVER, RAT (4829)*
- HYPOTHYROIDISM, SURGERY, SLOW WAVES, COLON, ILEUM, OXYGEN CONSUMPTION, RABBITS (4786)*
- ISLET CELL, PANCREAS, ELECTRON MICROSCOPY, LIGHT MICROSCOPY (4726)
- THYROID, TUMOR, DIARRHEA, MEDULLARY CARCINOMA, RECTOSCOPY, BRONCHOSCOPY, SURGERY (5341)

ENTERITIS
- ANTIBIOTIC, DIARRHEA, NEONATE (5371)
- CLOSTRIDIUM, DIARRHEA, SMALL INTESTINE (4884)
- CROHN'S DISEASE, HYPERVASCULARIZATION, MESENTERIC ARTERY, ANGIOGRAPHY (5066)
- HEMORRHAGE, GASTROINTESTINAL TRACT (5070)
- JEJUNUM, ILEUM, OSCARIS (5358)
- MALABSORPTION, PANCREATIC INSUFFICIENCY (5076)
- REGIONAL, CROHN'S DISEASE, APPENDIX (5067)
- REGIONAL, ULCERATIVE COLITIS, CROHN'S DISEASE, CYTOSTATICS, ANTIBIOTIC (5127)
- SMALL INTESTINE, STENOSIS, CELIAC ARTERY (5069)

ENZYME
- ACTIVITY, HEPATITIS, CIRRHOSIS, METHODS, HEMOLYSIS, SGOT, SGPT, SERUM, LDH, PLASMA, LIVER METASTASES (4933)
- ACTIVITY, PANCREAS, AMYLASE, LIPASE, CHYMOTRYPSIN, RAT EMBRYO, METHIONINE DEFICIENCY (4701)*
- ADENOSINE TRIPHOSPHOTASE, HEPATOCYTES, CELL CULTURE, FIBROBLASTS, CHICK EMBRYO (4741)*
- ALDOLASES, HEPATOMA, YOSHIDA ASCITES, ALDOLASE C (5175)*
- ALKALINE PHOSPHATASE, AMINOPEPTIDASE, ATPASE, GLUCURONIDASE, VIRAL HEPATITIS, ACUTE ATROPHY (5267)
- ALKALINE PHOSPHATASE, INTESTINE, X-IRRADIATION, RAT (4721)
- ALKALINE PHOSPHATASE, LIVER, METASTASES, DYSPEPSIA, LAPAROSCOPY, HYPOCHONDRIUM (5204)
- AMYLASE, DUODENAL JUICE, DETERMINATION, AMYLOCLASTIC TECHNIQUE, AUTO-ANALYZER (4812)
- AMYLASE, LIPASE, PANCREATITIS, BILIARY LITHIASIS, ABDOMINAL PAIN, LEUCOCYTE (5153)
- AMYLASE, PANCREATITIS, ALBUMIN (5156)
- AMYLASE, PANCREATITIS, DIAGNOSIS, AUTOANALYZER (4942)
- AMYLASE, PANCREATITIS, SHOCK, TRYPSIN INHIBITORS, INTERNAL BURN (5150)
- AMYLASE, SECRETION, PANCREAS (4816)

CARBOXYLASE, LIVER, HISTOCHEMISTRY, MICROSOMES, PHOSPHOPYRUVATE (4689)*
CHOLESTEROL-7 ALPHA-HYDROXYLASE, CIRCADIAN RHYTHM, BILE ACIDS, RIBONUCLEIC ACIDS, RIBOSOMAL PROTEINS (4853)
CHOLINESTERASE, EMBRYONIC LIVER, ENDOTHELIAL CELLS, CHICK (4736)
CYSTATHIONINE, ASSAY, LIVER (4735)
DEHYDROGENASE, ASSAY, LIVER (4737)
DEHYDROGENASE, OXIDOREDUCTASE, LIVER, METABOLISM (4857)
DISACCHARIDASE, PEPTIDASE, COLCHICINE, JEJUNUM (4711)*
DISULFIDE REDUCTASE, TRANSHYDROGENASE, MICROSOMES, NADH, PYRIDINE NUCLEOTIDES (4688)*
DRUG-METABOLISM, LIVER, EMETINE (4708)*
FAT, ABSORPTION, DIGESTION (4773)
GALACTOSYL-TRANSFERASE, INTESTINAL MUCOSA, CYTOPLASMIC FRACTIONS, GLYCOPROTEINS, RAT (4742)*
GAMMA-GLUTAMYL-TRANSPEPTIDASE, ALKALINE PHOSPHATASE, LIVER METASTASES, OBSTRUCTIVE JAUNDICE (4936)
GLUCURONIDASE, GASTRIC MUCOSAL CELL, GASTRIC JUICE (4976)*
GLUCURONYL TRANSFERASE, LIVER, BILIRUBIN, MENTHOL (4844)*
GLUCURONYLTRANSFERASE, LIVER, URANYL NITRATE, RENAL ACTIVITY, RAT (5225)
HEPATIC, MONOAMINE OXIDASES, MITOCHONDRIA, ELECTROPHORESIS, RADIOISOTOPE ASSAY (4691)*
INHIBITORS, ACUTE PANCREATITIS, LIPASE, ANTITHROMBIN III, SPLANCHNIC BLOCK (5163)
INHIBITORS, TRYPSIN, PANCREATITIS, CONTRYCAL, DUODENAL FISTULA (4981)
INTESTINAL, GLYCOSIDASE, DISACCHARIDE, CARBOHYDRATE, ABSORPTION, DIARRHEA, MEMBRANE PERMEABILITY (4870)*
INTESTINAL, FATS, EMULSIFICATION, LIPASE, TRIGLYCERIDE, HYDROLYSIS, ATP (4869)*
INTESTINE, MUCOSA, DNA (4723)
INTESTINE, MUCOSA, RAT (4748)
ISO-, GLUCOSE-6-PHOSPHATE-DEHYDROGENASE, LIVER EXTRACT, ERYTHROCYTE, RAT (4740)
ISO-, ULCERATIVE COLITIS, LACTICDEHYDROGENASE, RECTOSCOPY, ISOENZYME, RECTAL MUCOSA (5131)
ISOENZYME, LIVER, PURIFICATION, HUMAN, CHICKEN (4717)
LECITHIN-CHOLESTEROL ACYLTRANSFERASE, OBSTRUCTIVE, JAUNDICE (5301)*
LIPASE, PANCREAS, TETRACYCLINE (4814)
LIPASE, PANCREAS, TRIOCTANOIN (4817)
LIPASE, SMALL INTESTINE, PANCREAS, SECRETION, TRIBUTYRINE (4815)
LIVER, ADENOSINE, NUCLEOTIDE (4850)
LIVER, ALLYL ALCOHOL, LDH, TRANSAMINASE, MALIC DEHYDROGENASE, RATS (5174)*
LIVER, COENZYME, ALDEHYDE (4724)
LIVER, DEHYDROGENASES, AMINO ACID CATABOLISM, ALPHA-KETO ACIDS (4818)*
LIVER, GLYCEROL, TROUT (4846)
LIVER, ISOZYME (4728)
LIVER, INTERACTION, NUCLEOSIDE (4862)
LIVER, KIDNEY, AMPHIBIAN (4845)
LIVER, KWASHIORKOR, CHILDREN (5394)
LIVER, MICROSOME, WAX (4720)
LIVER, MITOCHONDRIA (4725)
LIVER, MITOCHONDRIA, CHICKEN (4719)
LIVER, MITOCHONDRIA, DEVELOPMENT (4727)
LIVER, MITOCHONDRIA, RAT, KINETICS (4843)*
LIVER, RAT, FOLATE, T4 INFLUENCE (4827)*
MEXASE, COLON, PANCREATITIS, BILIARY TRACT (5356)
MICROSOMAL HYDROXYLASE, LIVER, INDUCTION, REVERSIBILITY, SLEEPING TIME, BARBITURATE METABOLISM, RAT (4744)
MICROSOMAL HYDROXYLASE, LIVER, PENTOBARBITAL, SLEEPING TIME, INDUCTION (4743)
MICROSOME, LIVER, RAT (4716)
MITOCHONDRIAL DEHYDROGENASE, GASTRIC MUCOSA, BIOPSY, ELECTRON MICROSCOPY (4977)
MONOAMINE OXIDASE, LIVER MITOCHONDRIA, RADIOISOTOPE ASSAY, ELECTROPHORESIS, RAT (4691)*
MONOXYGENASE, LIVER, ADRENAL, MICROSOME, GUINEA PIG (4732)
MUCOSA, STOMACH, ATP (4751)
NEUTRAL, ACID B-GALACTOSIDASE, SMALL INTESTINE (4864)*
ORNITHINE AMINOTRANSFERASE, IMMUNOFLUORESCENCE, LIVER, RAT (4700)*
ORNITHINE-CARBAMYL TRANSFERASE, HEPATOMEGALY, AMEBIASIS, HISTOLOGICAL LESIONS, RADIOGRAPHY (5397)*
OXIDASE, MICROSOME, LIVER (4858)
PANCREAS, SECRETION, FASTING (4813)
PANCREATIC, LIPASE, AMYLASE, CHRONIC PANCREATITIS, ACUTE PANCREATITIS, PANCREOZYMIN (4938)
PEPSIN, GASTRICSIN, AMINO ACID, HUMAN (4810)
PHOSPHATASE, GLUCOSE-6, THIAMINE PYROPHASPHATASE, JEJUNUM, EPITHELIUM (4703)*
PROTEASE, PAPAIN, HEPATIC REGENERATION, PARTIAL HEPATECTOMY, RATS (4851)
PROTEIN, INTESTINE, ABSORPTION (4767)
REDUCTASE, METYRAPONE, MICROSOME, LIVER (4839)*
REGULATORY MECHANISM, INTESTINE, EPITHELIAL CELLS, CYCLOHEXAMIDE, ACTINOMYCIN D (4692)*
RIBONUCLEASE, PANCREAS, PROTEIN (4750)
SECRETION, COLON, NUTRITION (4886)*
SUBCELLULAR, THREONINE DEFICIENCY (4694)*
SUPPRESSION, PYRUVATE CARBOXYLASE, GLUCOSE, LIVER, RAT (4745)
SYNTHETASE, PANCREAS, TRYPTOPHANYL-TRNA, SPECTROFLUOROMETRY, PROTEIN CHROMOPHORES, TRYPTAMINE (4738)
THIAMIN PYROPHOSPHAKINASE, TRANSKETO-

  - LASE, PANCREAS, THIAMIN ABSORPTION, PHOSPHORYLATION, INTESTINE, RAT (5143)
  - TRANSAMINASE, LIVER DISEASE, EXERCISE, CHRONIC HEPATITIS, SUBSIDING HEPATITIS, CIRRHOSIS, LIVER CELL PERMEABILITY (4937)
  - TYROSINE AMINOTRANSFERASE, INDUCTION, HEPATOMA, GLUCOCORTICOID BINDING, CORTISOL, HEXAMETHASONE (5170)*
- EPIDEMIOLOGY
  - HEMORRHOID, RECTUM, PREGNANCY (5102)

  - SCAN, TECHNETIUM 99M, DIFFERENTIAL DIAGNOSIS, GASTRIC MUCOSA, SECRETION (4888)
  - TUMOR, CYTOLOGY, DIAGNOSIS (4930)
  - TUMOR, GASTROSCOPY, HIATUS HERNIA, POLYP, ESOPHAGUS, DIVERTICULI (4957)
  - TUMORS, POLYP, SURGERY (4985)
  - ULCER, DOGMATIL, SULPIRIDE (5035)
  - ULCER, DUODENUM, SURGERY (5027)
  - ULCER, FISTULA, SURGERY (5031)
  - ULCER, GASTROSCOPY, ANESTHESIA, DIAGNOSIS (4953)
  - ULCER, HEMORRHAGE, STENOSIS, PERFORATION (5034)
  - ULCER, MOTILITY, SURGERY (5032)
  - ULCER, PEPTIC ULCER, DUMPING SYNDROME, VAGOTOMY (5024)
  - ULCER, PERFORATION, MYOCARDIUM, CARDIA (5039)
  - ULCER, SMOKING, DUODENUM (5029)
- STRESS
  - SALMONELLA, EXCRETION, PIG (5357)
- SURGERY
  - ABDOMINAL, HEMORRHAGE, PERITONITIS, ADHESIONS (5337)
  - ABDOMINAL TRAUMA, LAPAROSCOPY, PERITONEAL HEMORRHAGE, HEMATOMA (4909)
  - ACUTE CHOLECYSTITIS, PANCREATIC ENZYMES, LIVER BIOPSY, JAUNDICE (5324)
  - ABDOMEN, AORTOGRAPHY (5359)
  - ACHALASIA, ESOPHAGUS, CARDIA (4972)
  - ACUTE APPENDICITIS, GAS GANGRENE, PERFORATION, DRAINAGE (5097)
  - ANESTHESIA, LIVER (5244)
  - ANUS, RECTUM, ANATOMY (4729)
  - APPENDICITIS, DIVERTICULITIS, COLON (5103)
  - APPENDIX, ENDOMETRIOSIS (5104)
  - BILIARY TRACT, BIOLOGICAL GLUE (5312)
  - BILIARY TRACT, GALLBLADDER, LIVER (5308)
  - CARDIAC ACHALASIA, STOMACH DILATATION, MEGA-ESOPHAGUS, HYPERTONIC PYLORUS, PYLOROPLASTY, CARDIOMYOTOMY, CHILDREN (4963)
  - COLON, ABSCESS, HEALING (5101)
  - COLON, ANTIBIOTIC, CARCINOMA (5118)
  - COLON, PENICILLIN, BACTERIA (4881)
  - ERROR, DUODENAL ULCER, PROGNOSIS, VAGOTOMY-RESECTION, HISTAMINE STIMULATION (5036)
  - ESOPHAGUS, FISTULA, ATRESIA (4971)
  - ESOPHAGUS, STENOSIS, CARCINOMA, PERFORATION (4965)
  - HEMORRHAGE, CANCER, ULCER (5372)
  - HODGKIN'S DISEASE, ABDOMEN, DIAGNOSIS (4911)
  - HYDATID CYST, LIVER, BILIARY TRACT, CHOLANGIOGRAPHY, ODDI'S SPHINCTER, PARASITES (5401)
  - ILEUM, MUCOSA, COLON, DUODENUM (5045)
  - INTESTINAL OCCLUSION, ABSCESS, STASIS, ADHESIONS (5334)
  - INTESTINE, ENTEROPTOSIS, OCCLUCION (5061)
  - INTESTINE, ISCHEMIA, MALABSORPTION (5086)
  - JEJUNUM (5046)
  - LIVER, ABSCESS (5208)
  - LIVER, JAUNDICE, CHOLESTASIS, HEPATITIS (5179)
  - LIVER, RADIOLOGY, PORTAL HYPERTENSION (5298)
  - MECKEL'S DIVERTICULUM, HEMORRHAGE, GASTRIC MUCOSA, SHOCK (5064)
  - MECKEL'S DIVERTICULUM, PERFORATION, INTESTINAL OBSTRUCTION, PERITONITIS, NEWBORN INFANT (5050)
  - MECKEL'S DIVERTICULUM, RADIOLGOY (5051)
  - OBSTRUCTIVE JAUNDICE, PANCREAS, METASTASES, LAPAROTOMY, CHOLANGIOGRAPHY (4941)
  - PANCREAS, JUICE COLLECTION (4772)
  - PANCREAS, PALPATION (4903)
  - PEPTIC JEJUNAL, ULCER, PERFORATION, ANASTOMOSIS, INFECTION, GASTRIC RESECTION (5062)
  - PORTOCAVAL SHUNT, CIRRHOSIS (5297)
  - RECTUM, CYSTOMETRIC EXAMINATION, BLADDER PRESSUREA HYPOTONUS, RETENTION (5095)
  - RECTUM, DUPLICATION (5108)
  - RELAPAROTOMY, POSTOPERATIVE INTESTINAL OBSTRUCTION, ILEUS, GASTRIC JUICE (5060)
  - REPARATIVE, PEPTIC ULCER, GASTRIC ULCER, DUMPING SYNDROME, AFFERENT LOOP, VAGOTOMY (5024)
  - SPHINCTEROTOMY, BIOPSY, VATER'S PAPILLA, TECHNIQUE (4944)
  - STOMACH, CARCINOMA (4988)
  - STOMACH, FISTULA, ULCER (5031)
  - ULCERATIVE COLITIS, ILEUS, CONTINENCE, COLECTOMY, ANASTOMOSIS (5128)
  - ULCERATIVE SOLITIS, RECTOLITIS, PSYCHIATRY, THERAPY, DIAGNOSIS (5125)
  - VAGOTOMY, LIVER, GALLBLADDER (5178)
  - VAGOTOMY, POST-VAGOTOMY SYNDROME, DIARRHEA, GASTRIC ACID (5375)
  - WILSON'S DISEASE, GASTRODUODENAL, HEMORRHAGE, PORTAL HYPERTENSION, LEUCOPENIA, THROMBOPENIA (5200)
- SYNDROME
  - BLIND LOOP, OSTEOMALACIA, PANCREATITIS, MALABSORPTION (5159)
  - BRILL-SYMMERS, SPLENIC TUMOR, PERFORATION, STOMACH, METASTASES, CACHEXIA (5011)

  - CRIGLER-NAJJAR, HYPERBILIRUBINEMIA, ICTERUS (5182)
  - CRIGLER-NAJJAR, HYPERBILIRUBINEMIA, LUMINAL TREATMENT, NEONATE (5220)
  - DUBIN-JOHNSON'S, ROTOR'S, JAUNDICE, LIVER (5219)
  - DUMPING, ANTISEROTONIN, METHYSERGIDE, GASTRECTOMY, GASTROENTEROSTOMY, ULCER (5079)
  - DUMPING, DUODENUM, ILEUM, ION (5080)
  - DUMPING, GASTRODUODENAL ULCER, HEMORRHAGE, SULPIRIDE (5038)
  - DUMPING, GASTRIC ULCER, PEPTIC ULCER, REPARATIVE SURGERY, PYLORIC ANTRUM, VAGOTOMY (5024)
  - GILBERT'S, HYPERBILIRUBINEMIA, LIVER (5205)
  - SJOGREN'S, LIVER, PATHOLOGY, RHEUMATOID ARTHRITIS (5206)

PREFACE

GASTROENTEROLOGY ABSTRACTS and CITATIONS is a publication of the National Institute of Arthritis and Metabolic Diseases. This specialized information medium has been initiated to fill an existing great need in the field of gastroenterology and to assist the Institute in meeting its obligations to foster and support laboratory and clinical research into the nature, causes, and therapy of diseases of the gastrointestinal tract. Publication of GASTROENTEROLOGY ABSTRACTS and CITATIONS makes available citations of all current papers relevant to this field from medical journals published throughout the world. Approximately one-third of the citations dealing with the major aspects of gastroenterology have accompanying abstracts.

The issuing of GASTROENTEROLOGY ABSTRACTS and CITATIONS under the auspices of the National Institute of Arthritis and Metabolic Diseases will provide a much needed current awareness tool to scientists and will facilitate greater integration of research and clinical efforts in this field. The number and great diversity of publications in the area of gastroenterology makes it imperative that an appropriate service be available t investigators and practitioners so that they may be apprised of progress with a minimum of delay. Our aim is to provide the readers with a readily systematized compilation of current published work. The publication will provide the greatest usefulness if these interested investigators will contribute their ideas and comment for consideration whenever possible.

GASTROENTEROLOGY ABSTRACTS and CITATIONS is published monthly and includes citations and abstracts from the biomedical world literature as they are currently received. In addition, yearly cumulated subject and author indexes are published.

This publication is available free to National Institutes of Health grantees and contractors working in the field of gastroenterology and libraries of medical schools. Requests from these qualified individuals to receive free copies of this publication must include their grant or contract number and the title of their project. These requests as well as address changes and other communications should be addressed to:

Scientific Communications Office
Gastroenterology Abstracts and Citations
National Institute of Arthritis and Metabolic Diseases
National Institutes of Health
Bethesda, Maryland 20014

Other individuals and libraries may receive this publication by subscribing *directly* to the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Subscription price per year in the United States, Canada, and Mexico, $16.00; foreign, $4.00 additional; and $1.25 for a single copy. Payment i required in advance, and check or money order should be made payable to the Superintendent of Documents.

PRE-CLINICAL SCIENCES

MORPHOLOGY, CELLULAR STRUCTURE AND HISTOCHEMISTRY

409 EFFECT OF SEDIMENTATION THROUGH SUCROSE
SOLUTIONS ON THE PROTEIN-SYNTHESIZING
ILITY OF RAT LIVER MICROSOMES. *(E.)* Leslie, R. A.
ept. Biochem., U. Queensland, St. Lucia, Australia)
d J. N. Mainbridge. *Biochem J* 117(5):893-898, 1970.

ver cell sap, ribosomes and microsomes (from albino
star rats) were prepared in order to examine the
fect of sedimentation through sucrose solutions on
e protein synthesizing ability of rat liver parti-
es. Centrifugation of the postmitochondrial super-
tant of rat liver through 1.0 M sucrose produced
rticles that had 85-90% less incorporating ability
a cell free protein-synthesizing system than either
bosomes or microsomes. The incorporation of $[^{14}C]$
enylalanine into protein by particles prepared by
dimentation through sucrose (1.0 M) was stimulated
out 20-fold by addition of polyuridine. The con-
nt of rapidly labeled RNA of microsomes was de-
eased during centrifugation through 1.0 M sucrose.
ese changes may be caused by breakdown of mRNA as
result of the activity of the ribonuclease which
s inhibited by a factor in the soluble fraction of
e cell.

10 STUDIES OF MAMMALIAN GLUCOAMYLASES WITH
SPECIAL REFERENCE TO MONKEY INTESTINAL
UCOAMYLASE. *(E.)* Seetharam, B. (Christian Med.
ll. Hosp., Vellore, India), N. Swaminathan and
N. Radhakrishnan. *Biochem J* 117(5):939-946, 1970.

e properties of highly purified preparations of
ucoamylase obtained from liver, spleen and intes-
ne of the monkey were compared. When a homogenate
epared in 1.15% potassium chloride from liver,
dney, spleen and intestine was centrifuged at high
eed (100,000 g, 1 hr), the majority (90%) of the
ucoamylase activity of liver, kidney and spleen
s found in the supernatant fraction, whereas over
% of the intestinal enzyme was in the sediment
action, and this could be solubilized by treatment
th papain. The liver and spleen enzyme showed
ximum activity at pH 4.8, whereas intestinal enzyme
hibited an optimum at pH 5.8 with either starch or
ltose as substrate. Liver and spleen glucoamylase
owed very narrow substrate specificity, acting only
starch and maltose. The Km values for both starch
d maltose with spleen (9.0, 10.0 mM, resp.) and
ver (8.3, 19.0 mM, resp.) enzyme were higher than
r the intestinal (1.6, 1.0 mM, resp.) enzyme. With
e intestinal enzyme (12.2, 13.0 unit/mg, resp.), the
ax values were higher for both starch and maltose
an those of the spleen (7.5, 6.0 unit/mg, resp.) and
ver (3.1, 5.3 unit/mg, resp.) enzyme. Gel filtration
Sephadex G-200 under identical conditions revealed
at liver and spleen glucoamylase emerges from the
lumns much later than the intestinal enyzme and heat
activation studies and DEAE-Sephadex chromatography,
th demonstrated 3 types of maltase (I, II and III)
esent in the intestinal mucosa. Of 3 peaks obtained
om separation on DEAE-Sephadex chromatography, glu-
amylase was clearly associated with maltase II.
is (0.1M), pentaerythritol (0.1M) and turanose
.03M) inhibited glucoamylase from liver, spleen and
testine but turanose inhibited the spleen and liver
zymes (% inhibition:67, 72, resp.) to a higher de-
ee than the intestinal (% inhibition:28) enzyme.
The intestinal enzyme may be involved to a limited extent in the hydrolysis of dietary starch and glycogen.

5411 GLYCOLIPIDS AND OTHER LIPID CONSTITUENTS OF NORMAL HUMAN LIVER. *(E.)* Kwiterovich, P. O., Jr. (Natl. Heart Lung Inst., Natl. Inst. Hlth., Bethesda, Md.), H. R. Sloan and D. S. Frederickson. *J Lipid Res* 11(4):322-330, 1970.

Glycolipids and other lipid constituents of normal human liver (obtained from 12 patients at autopsy, dead from causes unrelated to liver or lipid storage diseases) were separated and analyzed by thin layer chromatography and sequential lipid analysis. The mean contents of cholesterol, glycerides and total phospholipids was 3.9 ± 0.8, 19.4 ± 15.9 and 25.1 ± 2.7 mg/g wet weight, resp. The mean neutral glycolipid content of 0.19 ± 0.11 µmoles/g wet weight, represented 0.4% of the total lipid in liver. Ceramide dihexoside was the most abundant neutral glycolipid (.08 ± .05 µmoles/g wet weight). The predominant fatty acid methyl ester present in the hexane extract of the acidic methanol lysate were $C_{16:0}$ and $C_{18:0}$. The compound was tentatively identified as ganglioside G_{M3} or hematocide. The mean content of hematoside in the lower phase of 10 livers was .02 ± .008 µmoles/g wet wt. Liver samples of 0.5 to 1.0 g should be obtained at biopsy to permit a complete examination for lipid content in determining abnormalities in the concentration of most of the lipids involved in known lipid storage diseases.

5412 15α-HYDROXYLATION OF C_{19} STEROIDS IN RAT LIVER MICROSOMES. *(E.)* Gustafsson, J.A. (Karolinska Inst., Stockholm, Sweden) and B.P. Lisboa. *Biochem Biophys Acta* 210(1):199-201, 1970.

During the isolation of 3β,18-dihydroxy-5α-androstan-17-one from incubations of rat liver microsomes with 5α-androstan-3,17-dione, and 3α- and 3β-hydroxy-5α-androstan-17-one, it was observed that the mass spectrum of the trimethysilyl(silyl) ether of 3β,18-dihydroxy-5α-androstan-17-one was in some instances contaminated with a prominent peak at m/e 143. Transformation of the 18-hydroxy steroid into its 18-nor analog permitted the recording of a pure mass spectrum of the contaminating compound. It was identified as 3β,15α-dihydroxy-5α-androstan-17-one and is the first example of a 15α-hydroxylated C_{19} steroid formed *in vitro* in rat liver microsome preparations.

5413 ULTRASTRUCTURAL DIFFERENTIATION AND ENZYMATIC LOCALIZATION OF PHOSPHATASES IN THE DEVELOPING DUODENAL EPITHELIUM OF THE MOUSE: II. THE NEWBORN MOUSE. *(E.)* Hugon, J. S. (Med. Ctr., U. Sherbrooke, Quebec, Canada). *Histochemie* 22(2): 109-124, 1970.

Ultrastructural differentiation and enzymatic localization of acid or alkaline phosphatase were studied in the absorbing cells of the duodenal epithelium of newborn BALB/c mice. In the first week after birth the supranuclear part of the absorbing cells is formed by a network of smooth tubules and vacuoles connected with each other and most of these formations showed alkaline phosphatase activity. Below this zone, a cluster of dense tubules and dense bodies was situated above the Golgi apparatus and the nucleus and alkaline and acid phosphatase activities were present in this cluster but the Golgi cisternae and vesicles were negative for both enzymes. During the second week after birth the supranuclear zone of the absorbing cells exhibited striking modifications with formations of autophagic vacuoles and disappearance of the network of smooth profiles; however, the phosphatase activities were still present in the remaining dense tubules and dense bodies. On the sixteenth day after birth the morphological structure of the absorptive cells was similar to that observed in the full grown gut and alkaline phosphatase occurred in the Golgi cisternae and acid phosphatase in the Golgi vesicles.

5414 ENDOCRINE CELLS IN MAMMALIAN GASTRIC MUCOSA: POSSIBLE STORAGE SITES FOR VITAMIN B_{12}-BINDING PROTEINS.

(E.) Hakanson, H. (Dept. Pharmacol., U. Lund, Sweden), G. Liedberg and K. Lindstrand. *Experientia* 26(4):357-359, 1970.

The cellular storage site of the Intrinsic Factor (the gastric antipernicious principle) was determined in the mouse, rat, hamster and the rabbit and the regional and topographical distribution of the vitamin B_{12}-binding proteins were compared with that of the gastric enterochromaffin cells and the enterochromaffin-like cells, which are believed to be active in the secretion of gastrointestinal polypeptide hormones. Vitamin B_{12}-binding proteins were quantitated radiometrically after conjugation with Co-cyanocobalamin followed by Sephadex gel chromatography, and the number of enterochromaffin-like cells was calculated in 6 micron sections (taken from along the greater curvature) to establish their regional distribution, or in 20 micron horizontal serial sections, to establish their topographical distribution. The regional distribution of gastric vitamin B_{12}-binding proteins followed the distribution of enterochromaffin-like cells closely in mouse, rat and hamster, and the enterochromaffin cells were found almost exclusively in the pyloric area, while the enterochromaffin-like cells were found in the oxyntic gland area. In the guinea pig, the distribution of vitamin B_{12}-binding proteins was well correlated with that of the enterochromaffin-like cells in the pyloric gland area and in the adjacent oxyntic gland area. In the rabbit, the distribution of vitamin B_{12}-binding proteins correlated with a large population of reserpine-resistant, serotonin-containing enterochromaffin cells (Type II) in the oxyntic gland area. In oxyntic gland area, the vitamin B_{12}-binding proteins were restricted to the basal layer of the mucosa, following the topological distribution of the enterochromaffin cells. At a depth of 0.3 mm of mucosa the vitamin B_{12}-binding protein concentration was 5000 cpm/section and the concentration of enterochromaffin cells was 500/section, while at a depth of 0.6 mm (in the submucosal region), the protein concentration was 18000 cpm/section and the enterochromaffin cells numbered 2500/section.

5415 ACTIVATION *IN VITRO* OF RAT HEPATIC UDP-GLUCURONYLTRANSFERASE BY ULTRASOUND.

(E.) Henderson, P. T. (Fac. Med., U. Nijmegen, Netherlands). *Life Sci* 9(9):511-518, 1970.

Livers from adult male Wistar rats were used to study the influence of ultrasound on the UDP-glucuronyltransferase activity in whole liver homogenates and also to determine if the enzyme kinetics at varying acceptor and UDP-glucuronate concentrations are altered by ultrasonic treatment. The mean UDP-glucuronyltransferase activities at saturating substrate and cosubstrate concentrations (expressed as µmoles p-nitrophenol conjugated/hr/g liver) for untreated homogenates and homogenates ultrasonicated for 60 sec were 15.1 ± 3.5 and 50.8 ± 12.5, resp. Maximal activation was reached after about 60 sec. Preincubation for 10 min in the presence of 0.05% Triton X-100 did not result in a further increase of the enzymatic activity in homogenates, which were already maximally activated by ultrasound; for non-sonicated homogenates a 300% increase of the UDP-glucuronyltransferase activity was observed. If the liver homogenate was preincubated without additions at 37C for 4 hr, a spontaneous increase of activity of about 300% was observed. The enzyme activity of the homogenates previously activated by ultrasound only rose to about 125% of the initial values after incubation at 37C for 4 hr. The kinetic studies demonstrated that ultrasonic treatment of the liver homogenates resulted in a significant increase of the apparent K_m-values for UDP-glucuronyltransferase (0.39 ± 0.05 for the untreated homogenate versus 2.30 ± 0.62 for the ultrasonicated homogenate).

5416 OCCURRENCE OF C_{20} ALK-1-ENYL AND ALKYL GLYCEROL ETHERS IN PHOSPHOLIPIDS OF THE RAT INTESTINAL MUCOSA.

(E.) Paltauf, F. (Inst. Physiol. Chem., U. Graz, Austria) and D. Polheim. *Biochim Biophys Acta* 210(1):187-189, 1970.

The relative composition of the alkyl and alk-1-enyl glycerol ethers in the phosphatidylcholine and phosphotidylethanolamine fractions of the intestinal mucosa of 10 adult male Sprague-Dawley rats was examined by gas-liquid chromatography. The predominance of the $C_{16:0}$ chain in the alkyl (36.1%) and alk-1-enyl glycerol ethers (32.1%) of the phosphatidylcholine fraction corresponded to the high (60%) proportion of $C_{16:0}$ acid present in position 1 of phosphatidylcholine. In phosphatidylethanolamine, however, $C_{18:0}$ was the preferred (62.5%) chain length in the fatty acids of position 1 and in both (47.0 and 39.1%) types of ether-linked hydrocarbons. The high percentage of $C_{20:0}$ moieties, rather unusual constituents of mammalian tissue, especially in alkyl glycerol ethers of phosphatidylethanolamine (43.6%) but also of phosphatidylcholine (22.0%) as well as among alk-1-enyl glycerol ethers (17.5% and 14.1%), strongly emphasizes a metabolic relation between these 2 classes, either via a common precursor or allyl lipids being the precursors of alk-1-enyl lipids.

417 AN ELECTRON MICROSCOPIC AND FUNCTIONAL STUDY OF VERY LOW DENSITY LIPOPROTEINS
N INTESTINAL LYMPH.

(E.) Ockner, R.K. (U.
alifornia San Francisco Med. Ctr.,) and A.L. Jones.
Lipid Res 11(4):284-292, 1970.

ery low density lipoproteins (S_f 20-400) in in-
estinal lymph of male Sprague-Dawley rats receiv-
ng mixed micelles (fatty acid-monoolein-tauro-
holate) or a suspension of cholestyramine were
tudied by preparative ultracentrifugation and
lectron microscopy. Analysis (ultracentrifugation)
f lymph collected during a 3 hr intraduodenal
nfusion of isotonic NaCl, showed the very low den-
ity lipoprotein fraction carrying 1.5 mg trigly-
eride and 0.18 mg cholesterol per hr, while chylo-
icrons carried 1.7 mg and 0.007 mg, resp. An elec-
ron micrograph of the shadow-casted lymph (d >
.006) lipoproteins, in which most particles were
the size range of plasma very low density lipo-
oteins (300-1000 Å in diameter), confirmed the
portance of very low density lipoproteins in fast-
g lymph. Administration of palmitate-monoolein
d linoleate-monoolein micelles resulted in simi-
rly increased lymph triglyceride values (20.6
d 16.2 mg/hr, resp.). More lipid was carried in
ery low density lipoprotein during palmitate ab-
rption than during linoleate absorption (22% and
% of total lymph triglyceride, resp.). Particles
the linoleate-infused lymph show significantly
eater electron density, greater tendency to clump,
d generally a larger diameter than particles in
e palmitate lymph. An apparent lack of particle
abilization in the palmitate lymph is probably due
the lesser degree of osmiophilia of the saturated
tty acid. It seems that in the fasting state most
the endogenous lipid in intestinal lymph is trans-
rted in very low density lipoprotein which resem-
e plasma very low density lipoprotein in composi-
on, S_f value, and electrophoretic mobility.

18 ISOLATION AND CHARACTERIZATION OF REDUCED NICOTINAMIDE ADENINE DINUCLEOTIDE PHOSPHATE:
RRI CYTOCHROME c OXIDOREDUCTASE AND IDENTIFICATION
CYTOCHROME b5 IN THE LIVER OF HUMAN INFANTS.

(E.)
yka, L. F. (Stanford U. Sch. Med., Calif.). *Biochem*
armacol 19(3):945-951, 1970.

ver homogenates from a newborn and a premature infant
d from Sprague-Dawley rats were used to isolate and
aracterized NADPH:ferri cytochrome c oxidoreductase
d to identify cytochrome b5. Enzymatic activity was
und largely in the 9000 g supernatant and resultant
crosomal fractions of the liver homogenates and the
eld of washed microsomal protein was about 14 mg/g
ver for both specimens. Exposure to trypsin for
min resulted in solubilization of about 25% of the
crosomal protein and virtually all of the enymatic
tivity (solubilization was defined as non-sedimentation
er centrifugation at 105,000 g for 2 hr). The spe-
fic activities of the first 2 active fractions from
newborn specimen from the DEAE cellulose column
omatograph were 37 and 53 μmoles of cytochrome c
duced/min/mg and the specific activity of the next
action was estimated at 80. Assuming a mean value
50, these fractions were about 100x more active than
microsomes and represent a purification of about
600-fold over that of the 9000 g supernatant. Kinetic studies performed on DEAE fractions showed concentrations of NADPH varying from 2 x 10^{-4} to 1 x 10^{-6}M in the presence of an excess of cytochrome c. The reciprocal plot of Lineweaver-Burke yielded a K_m value of 3.6 x 10^{-6}M. The molecular weight and pH optima of the human enzyme were similar to that of the rat enzyme (67,000 and 7.9-8.5, resp.).

5419 GLYCOPROTEIN BIOSYNTHESIS: PURIFICATION AND PROPERTIES OF GLYCOPROTEIN -- *N*-ACETYLGLUCOSAMINYL TRANSFERASES FROM GUINEA PIG LIVER UTILIZING ENDOGENOUS AND EXOGENOUS ACCEPTORS.

(E.) Bosmann, H. B. (Dept. Pharmacol. Toxicol., U. Rochester, New York). *Europ J Biochem* 14(1):33-40, 1970.

A glycoprotein:N-acetylglucosamine transferase utilizing endogenous acceptors and a fetuin:N-acetylglycosamine transferase utilizing a defined fetuin acceptor from which sialic acid, galactose and N-acetylglucosamine had been removed were characterized from guinea pig liver. Both glycoprotein:N-acetylglucosamine enzyme systems used uridine diphosphate-N-acetylglucosamine as substrate, required Mn^{+2}, and had optimum pH of 5.4. Both enzyme systems were solubilized by extraction of the liver with 0.1% Triton X-100. The fetuin:N-acetylglucosamine transferase was separated from endogenous acceptors and purified more than 24-fold on Sephadex G-200. The endogenous system had a Michaelis-Menton constant of 0.6 μM and the exogenous fetuin:N-acetylglucosamine transferase had a constant of 3.8 μM with respect to N-[^{14}C] acetylglucosamine. The fetuin:N-acetylglucosamine transferase did not transfer any other nucleotide diphosphate sugar onto the acceptor (even uridine diphosphate-N-galactosamine was not transferred). The exogenous and endogenous systems may be identical except that the endogenous acceptor was removed during purification of the enzyme.

5420 ABSENCE OF CYSTATHIONASE IN HUMAN FETAL LIVER: IS CYSTINE ESSENTIAL?

(E.) Sturman, J. A. (New York St. Inst. Basic Res. Mental Retard., Staten Island, N. Y.), G. Gaull and N. C. R. Raiha. *Science* 169(3940):74-76, 1970.

The development of the transsulfuration pathway and the activities of methionine-activating enzyme, cystathionine synthase, and cystathionase were examined in 24 fetuses obtained at therapeutic abortion (2.5 to 20.5 cm, crown-rump length), 3 premature infants who died during the first 24 hr of life, and full-term newborn who died after 4 hr. Cystathionase activity was not measureable in the liver of any of the 24 fetuses or 3 premature infants and barely measurable in the full-term infant. The use of 0 to 4 μmole of cystathionine or 0 to 6.25 μmole of pyridoxal 5'-phosphate failed to elicit a measurable activity of cystathionase in the fetal liver. Cystathionine, the substrate of cystathionase, was present in the fetal liver in relatively high concentration (14 μmoles/100 g). The activities of cystathionine synthase and of methionine-activating enzyme from the crude extracts of the immature human during the period of gestation studied were 25-33% of those found in similar preparations from the mature human. Neither of these activities showed a correlation with crown-rump length. Crude extracts from placentas obtained with the same fetuses showed no measurable activity of any of these enzymes or transsulfuration. No cystathionine was detected in the blood or amniotic fluid from the same fetuses. It was suggested that cystine or cysteine may be an essential amino acid in the immature human.

5421 THE ACYLATION OF GLYCEROPHOSPHATE IN RAT LIVER: A NEW ASSAY PROCEDURE FOR GLYCEROPHOSPHATE ACYLATION, STUDIES ON ITS SUBCELLULAR AND SUBMITOCHONDRIAL LOCALIZATION AND DETERMINATION OF THE REACTION PRODUCTS. *(E.)* Daae, L. N. W. (Inst. Clin. Biochem., U. Oslo, Norway) and J. Bremer. *Biochim Biophys Acta* 210(1):92-104, 1970.

A new assay procedure was used to study glycerophosphate acyltransferase in rat liver homogenates and in subcellular and submitochondrial fractions which were incubated with (-)-palmitylcarnitine, CoA and carnitine palmityltransferase as a donor system for activated fatty acids and *sn*[I-(3)-^{3}H]-glycero-3-phosphate as the acyl acceptor. The reaction products were extracted from the incubation mixture with *n*-butanol. Differential and sucrose density gradient centrifugation of rat liver homogenates showed that glycerophosphate acyltransferases have bimodal intracellular localization; 50 to 66% of the total activity was found in the mitochondria with the rest in the microsomes. Subfractions of mitochondria showed that the glycerophosphate acylation enzymes are localized mainly in the outer membrane, based on the pattern of the marker enzymes found in the subfractions. The recovery of mitochondria fractionation experiments was repeatedly low (60%). Liver mitochondria had a greater capacity for acyl-CoA glycerophosphate acyl transfer than for fatty acid activation. Thin-layer chromatography showed that mitochondria chiefly produced lysophosphatidic acid, some phosphatidic acid and monoglyceride. Phosphatidic acid was the chief product of the microsomes, as well as some diglyceride and monoglyceride. Reaction products obtained with total homogenate were quite similar to those of the microsomes.

5422 SUBCELLULAR DISTRIBUTION OF ACYL-CoA: CHOLESTEROL ACYLTRANSFERASE IN RAT LIVER CELLS. *(E.)* Stokke, K. T. (Inst. Clin. Biochem., U. Oslo, Norway) and K. R. Norum. *Biochim Biophys Acta* 210(1):202-204, 1970.

Endogenously tritiated cholesterol (0.25 mC DL-[5-^{3}H] mevalonate injected i.p.) and exogenous 4-^{14}C-cholesterol were used as substrates for the cholesterol esterification system in liver homogenates obtained from male Wistar rats. An isotopic equilibrium between free and esterified cholesterol in the different subcellular liver fractions had been achieved 4 hr after mevalonate injection. The bulk of the acyl-CoA:cholesterol acyltransferase activity was present in the microsomal fraction and the recovery of the enzyme activity was satisfactory but not complete. The distribution of enzyme activity closely resembled that of the microsomal marker enzyme. Very little esterification of cholesterol was found to take place in the soluble fraction. The total activity of acyl-CoA:cholesterol acyltransferase determined by using endogenous cholesterol was 3.4 nmoles/min/g whole liver, which was about half that calculated from the assay using exogenous cholesterol, assuming total isotope equilibrium.

5423 STUDIES ON THE MECHANISM OF FATTY ACID SYNTHESIS: XXIII. THE ACYL BINDING SITES OF THE PIGEON LIVER FATTY ACID SYNTHETASE. *(E.)* Joshi, V. C. (Duke U. Med. Ctr., Durham, N. C.), C. A. Plate and S. J. Wakil. *J Biol Chem* 245(11):2857-2867, 1970.

Biochemical analysis was made of the covalent binding sites of acetyl, malonyl, and hexanoyl groups to pigeon liver fatty acid synthetase. Performic acid oxidation of the acyl synthetases demonstrated that the synthetase possesses two types of acyl binding sites which are thiol and nonthiol in nature. The presence of 2 thiol binding sites was confirmed by studies on radioactive peptic peptides obtained from ^{14}C-acetyl synthetase and ^{14}C-malonyl synthetase. The two thiol sites are the sulfhydryl group of the 4'-phosphopantetheine moiety of the synthetase and the sulfhydryl group of a cysteine residue, both of which bind acetyl groups and only the former binds malonyl groups. The nonthiol binding site has been tentatively identified as being the hydroxyl group of a serine residue. Prior treatment of the synthetase with high concentrations of *N*-ethylmaleimide inhibited all binding of acetyl and malonyl groups, while prior treatment with low concentrations of *N*-ethylmaleimide resulted in inhibition of thiol binding but had little effect on the nonthiol binding of these acyl groups. Prior treatment of the synthetase with iodoacetamide had no effect on the binding of acetyl and malonyl groups to the 4'-phosphopantetheine sulfhydryl but inhibited acetyl binding to the sulfhydryl of the cysteine residue. The order of acetyl binding to the synthetase seemingly binds first at the nonthiol site with successive transfers to the 4'-phosphopantetheine sulfhydryl and the cysteine sulfhydryl; the binding of malonyl groups apparently follows the same sequence except that malonyl groups are not transferred from the 4'-phosphopantetheine sulfhydryl to the cysteine sulfhydryl.

5424 VITAMIN K DEPENDENT FORMATION OF FACTOR VII BY A CELL-FREE SYSTEM FROM RAT LIVER. *(E.)* Babior, B. M. (Boston City Hosp., Mass.) and R. S. Kipnes. *Biochemistry* 9(13):2564-2569, 1970.

The role of vitamin K in the synthesis of clotting factor VII was studied in a cell-free system in the liver of young Charles River rats (150 to 180 g). A group of rats was poisoned 18 hr before sacrifice by i.p. injection of warfarin (2.5 g/100 g wt.) Rat livers were homogenized and whole cells and nuclei were removed by centrifugation (900 g for 5 min), and subcellular fractions for mitochondrial and microsomal determinations were prepared by further centrifugation. Factor VII was assayed by a one-stage method based on the correction of the coagulation defect of plasma from a human factor VII-deficient patient, and protein was assayed by the biuret method.

hen the cell-free homogenate and culture media are
ncubated at 37° C with $CaCl_2$, phenazine methosulfate,
TP and reduced glutathione, the factor VII activity
ises from a starting level of less than 0.05 units/
g protein to a maximum of 0.15 units/mg protein
n less than one hour, and begins to decline to
.10 units/mg protein in three hours. The increase
n factor VII activity is not due to a nonspecific
ffect of the homogenate on the assay, nor to any
ctivation of the preformed clotting factors during
ncubation, but it appeared to be the result of the
ormation of a new clotting factor during incubation.
he appearance of factor VII activity was completely
bolished in the livers of rats pretreated with
arfarin. Administration of vitamin K *in vivo* re-
tored the factor VII forming capacity of homogenates
rom warfarin-treated rats, but *in vitro* addition of
itamin K did not reverse the inhibition of factor VII
ormation. Omission of ATP, glutathione or phenazine
ethosulfate from the reaction mixture did not inhibit
ormation of factor VII. Omission of calcium ion de-
reased the factor VII activity from a normal value
f 0.123 ± 0.28 units/mg protein to 0.027 ± 0.013
nits/mg protein, and omission of tissue culture
edium (Eagle's medium) completely abolished the
actor VII activity. Factor VII forming system is
ocated in the soluble fraction (the 105,000 g super-
atant) of the homogenate.

425 ANTAGONISTIC EFFECT OF FOREIGN COMPOUNDS ON MICROSOMAL ENZYMES OF THE LIVER OF THE
AT. *(E.)* Feuer, G. (Dept. Path. Chem., U. Toronto,
nada) and V. Granda. *Toxic Appl Pharmacol*
(3):626-637, 1970.

e effect of various foreign compounds on the acti-
ty of rat hepatic microsomal enzymes was studied
enzyme assay. Coumarin (1 mmole/kg, p.o.) sig-
ficantly ($P < 0.01$) decreased inorganic glucose-6-
rophosphatase and inosine, guanosine and uridine
phosphatase activities. 4-Methylcoumarin had no
fect on these enzymes, but it increased the activity
drug-metabolizing enzymes (substrates of which were
umarin, 4-methylcoumarin, nitroanisole, codeine,
tylated hydroxytoluene and hexobarbital). Carbon
trachloride, ethionine, and thioacetamide also
paired phosphatase activity and slightly reduced
ug-metabolizing enzyme activity. Hexobarbital,
enobarbital, 3-methylcholanthrene, butylated hy-
oxytoluene, its alcohol and its alcohol-O-methyl
her, did not affect phosphatase activities but in-
ced the synthesis of drug-metabolizing enzymes to
e same extent as did 4-methylcoumarin. The de-
eased phosphatase activity induced by coumarin and
e increased drug-metabolizing enzyme activity in-
ced by 4-methycoumarin were blocked when these com-
unds were administered simultaneously. A similar
tagonism was produced by the simultaneous admini-
ration of carbon tetrachloride and 3-methylcho-
nthrene or phenobarbitol, suggesting, in both cases,
common site in their action on the endoplasmic re-
culum.

26 THE SURFACE CHARGE OF RAT LIVER MITOCHONDRIA AND THEIR MEMBRANES:
ARIFICATION OF SOME CONTROVERSIES CONCERNING MITOCHONDRIAL STRUCTURES. *(E.)* Heidrich, H.G. (Max Planck Inst. Res., Munich, Germany), R. Stahn and K. Hannig. *J Cell Biol* 46(1):137-150, 1970.

Preparative free flow electrophoresis was used to examine the surface charge of intact mitochondria and submitochondrial particles obtained from the livers of Sprague-Dawley rats. Two fractions were obtained when submitochondrial preparations obtained by a swelling-contraction procedure were examined with this technique. The same electrophoretic properties as intact mitochondria was demonstrated by one of the fractions (which indicated that it was derived from the outer limiting membrane of the mitochondrion) and this fraction contained monoamine oxidase and rotenone-insensitive NADH-cytochrome *c* reductase. The other fraction exhibited an electrophoretic mobility which was different from that of intact mitochondria, and this fraction contained enzymes characteristic of the inner-membrane matrix fraction, such as soluble and particulate enzymes of the Krebs cycle. Microsomes exhibited an electrophoretic mobility which was almost identical with that of the outer mitochondrial membrane. The outer membrane of the mitochondrion apparently is the sole determinant of the surface charge of the mitochondria.

5427 DIETARY REGULATION OF GLYCOLYTIC ENZYMES: V. LACK OF EFFECT OF INTRAMUSCULARLY ADMINISTERED SEX STEROID ON MALE AND FEMALE RAT JEJUNUM.
(E.) Stifel, F.B. (Fitzsimons Gen. Hosp., Denver, Colo.), R.H. Herman and N.S. Rosensweig. *Biochim Biophy Acta* 208(3):368-372, 1970.

The effects of estradiol, progesterone and testosterone (100 µg/100 g body weight, i.m.) on the activities of glycolytic enzymes were studied in the rat (male and female Holtzmann) jejunum by enzyme assay. The sex hormones did not produce a demonstrable effect on the activities of the jejunal carbohydrate-metabolizing enzymes (phosphofructokinase, pyruvate kinase, fructosediphosphatase, hexokinase and fructose-1,6-diphosphate aldolase) in either male or female rats. However, estradiol significantly increased ($P < 0,01$) the uterine activities of pyruvate kinase (control: 1352 ± 107; treatment: 3912 ± 212 nmoles/min/mg protein) and phosphofructokinase (control: 44.1 ± 3.7; treatment: 81.7 ± 5.4 nmoles/min/mg protein). The observations with i.m. sex hormones are in marked contrast to the adaptive changes seen previously in jejunal enzyme activities following p.o. administration of the same dose of the same sex hormones; hence, the route of administration of sex hormones appears to play a prominent role in the ability of these compounds to regulate jejunal enzyme activity.

5428 LOCALIZATION OF THE ENERGY-INDEPENDENT K^+-H^+ EXCHANGE IN THE OUTER MEMBRANE OF RAT LIVER MITOCHONDRIA.
(Ger.) Lutze, G. (Med. Acad. Magdeburg, Germany), W. Liese and W. Kunz. *FEBS Letters* 8(4):210-212, 1970.

The localization of the energy-independent K^+-H^+ exchange was investigated in intact mitochondria and submitochondrial particles obtained by differential centrifugation of liver homogenates from Wistar rats. The proton emission was measured by glass electrodes at 22°C over an agar-tris/HCl bridge in a K^+-free medium, and the half-saturation constants were determined by KCl solutions of 5, 10, and 20 mM. Proton emission was shown to be independent of the KCl medium, and, with a reference medium of protein, the H^+ emission through outside membranes was demonstrated by a decrease in KCl concentration which was higher than in the intact mitochondria (outer membranes: intact mitochondria = 4-5:1). The K^+-H^+ exchange was localized in the mitochondrial outer membranes and the H^+-emission was found to correlate with the specific activity of monoamine oxidase (MAO), as shown by the disintegration of mitochondria with various digitonin concentrations (with 1 mg digitonin/10 mg mitochondrial protein, 10-20% of the MAO activity is released and with 2 mg/10 mg, 70-80% MAO activity was released).

5429 DNA POLYMERASE ACTIVITIES ASSOCIATED WITH SMOOTH MEMBRANES AND RIBOSOMES FROM RAT LIVER AND HEPATOMA CYTOPLASM. *(E.)* Baril, E. F. (Duke U. Med. Ctr., Durham, N. C.), M. D. Jenkins, O. E. Brown and J. Laszlo. *Science* 169(3940):87-89, 1970.

DNA polymerase activity associated with smooth membranes and ribosomes was studied in subfractions derived from the postmicrosomal supernatant solution from normal rats liver and from Morris hepatoma 7777. DNA polymerase activity in the normal rat liver was low and had no preference for native or heat-denatured DNA as primer while DNA polymerase activity was higher in hepatoma tissue and had a preference for heat-denatured DNA as primer. After sucrose gradient centrifugation of the resuspended pellet (particulate matter from the postmicrosomal supernatant solution), nearly all of the denatured primer-preferring DNA polymerase activity in the pellet fractions from liver or hepatoma tissue was concentrated with the membrane fraction. The DNA polymerase activity with denatured DNA primer was about 8-fold greater in the membrane fraction from the hepatoma than from normal liver. Polymerase activity that preferred native DNA as primer was also found in the free ribosome obtained by sucrose gradient centrifugation of the pellet, with the activity being 3 times higher in ribosomes from the hepatoma tissue. The postmicrosomal supernatant solution of rat liver contained 45-50% of the total DNA polymerase activity present in the crude homogenate and most (90-95%) of the denatured DNA primer-preferring activity of the postmicrosomal supernatant solution of rat liver and hepatoma sedimented after 15 hr of centrifugation at 105,000 g. Maximal activity of the DNA polymerase in the membrane and ribosome fractions required the addition of Mg^{++}, DNA, and a sulfhydryl reducing agent.

5430 EXTRACTION OF POLYPHOSPHOINOSITIDES WITH NEUTRAL AND ACIDIFIED SOLVENTS: A COMPARISON OF GUINEA-PIG BRAIN AND LIVER, AND MEASUREMENTS OF RAT LIVER INOSITOL COMPOUNDS WHICH ARE RESISTANT TO EXTRACTION. *(E.)* Michell, R. H. (Dept. Biochem., U. Birmingham, England), J. N. Hawthorne, R. Coleman and M. L. Karnovsky. *Biochim Biophys Acta* 210(1):86-91, 1970.

Diphosphoinositide (phosphatidylinositol 4-phosphate) and triphosphoinositide (phosphatidylinositol 4,5-diphosphate) were quantitatively obtained (in almost colorless extracts not severely contaminated with chloroform-insoluble material or inorganic phosphate) from guinea-pig (400-600 g) brain using a mixture of chloroform, methanol and 2 M KCl. The same technique did not extract polyphosphoinositides from guinea-pig liver or from several other tissues (kidney, heart, lung and skeletal muscle). Analysis of the residue remaining after extraction of lipids from Wistar male rat (300-400 g) liver, and of phosphate ester fractions obtained from this tissue by acid hydrolysis showed only low concentrations of inositol attributable to inositol di- and triphosphates. These results are not consistent with a previous report of relatively high concentrations of these esters in rat liver.

5431 SEDIMENTATION PROPERTIES OF RAT LIVER MITOCHONDRIA: EFFECTS OF CORTISONE TREATMENT. *(E.)* Loeb, J. N. (Columbia U. Coll. Physician Surgeon, New York, N.Y.) and D. V. Kimberg. *J Cell Biol* 46(1):17-26, 1970.

Estimation of liver mitochondrial size based on sedimentation velocity and the relation of cortisone treatment to sedimentation properties of liver mitochondria was studied in albino rats (120-150 g). In the treated animals, cortisone acetate (5 mg, s.c.) was given daily for seven days prior to sacrifice, following which the liver was removed and prepared for sucrose gradient analyses. Mitochondria from the treated animals consistently sedimented at a greater velocity (1.4 times) compared with the control rats and the experimentally observed sedimentation rate (s=2.36 cm) proved to be very close to the expected value (s=2.38 cm). Mitochondria from cortisone treated animals was also found by electron microscopy to be larger in size than those in controls The fact that the increase in sedimentation velocity of mitochondria from the treated animals was less than predicted suggests the possibility of alterations in their composition, such as water content or lipid content.

5432 UBIQUINONE FROM RAT LIVER GOLGI APPARATUS FRACTIONS. *(E.)* Nyquist, S. E. (Dept. Biol. Sci., Purdue U., Lafayette, Ind.), R. Barr and D. J. Morre. *Biochim Biophys Acta* 208(3):532-534, 1970.

Ubiquinone extracted from isolated Golgi apparatus fractions (modification of the methods of Cheetham *et al.* and Morré *et al.*) was purified on thin layer or alumina columns, quantitated (nmoles/mg protein) and compared with that extracted from mitochondria in rat liver. Thin layer purification of ubiquinone from both Golgi apparatus and mitochondria yielded higher concentrations (3.85 and 2.48 resp.) than alumina column samples (2.42 and 1.43 resp.) even though the column samples had less neutral lipid and steroid contamination, and the content of the Golgi apparatus was about 1.7 times that of mitochondria.

5433 CELL LOSS FROM SMALL INTESTINAL MUCOSA: A MORPHOLOGICAL STUDY. *(E.)* Pink, I. J. (St. Thomas Hosp., London, England), D. N. Croft and B. Creamer. *Gut* 11(3):217-222, 1970.

A quantitative assessment was made of the proportion of various cell types found in saline washings of the luminal surface of the small intestine of normal humans and rats. In anesthesized rats, the small intestine was occluded at the duodenal-jejunal flexure, and saline was washed through the entire length of the small bowel and collected at the terminal ileum. In 7 humans (3 normal and 4 with celiac syndrome), a 5 cm segment of small intestine was washed using a triple-lumen tube which collected material arising from the small intestine alone. Clumps of cells examined by light microscopy were difficult to differentiate since no fine structures (brush border) could be identified while under the electron microscope, different cellular structures could be distinguished and cell types identified. Surface epithelial cells were identified by the presence of microvilli on the well-preserved brush borders and leucocytes were identified by the numerous electron-dense bodies within the cytoplasm, although the characteristic centriole next to the nucleus was not seen. In four specimens (293 cells) of rat small intestine washings, 85% of the cells were recognizable intestinal epithelial (absorptive) cells, 5% were leucocytes, and 10% were unidentifiable cells. In 3 washings (288 cells) from normal subjects 80% of the cells were epithelial cells, 2% were leucocytes and 18% were unidentifiable cells. Four intestinal washings (394 cells) from patients with celiac syndrome (flat mucosa) contained 82% small intestine epithelial cells, 5% leucocytes and 13% unidentifiable cells.

5434 THE ISOLATION BY ISOPYCNIC DENSITY-GRADIENT CENTRIFUGATION OF TWO MITOCHONDRIAL POPULATIONS FROM LIVERS OF EMBRYONIC AND FED AND STARVED ADULT RATS. *(E.)* Pollak, J. K. (Dept. Histol. Embryol., U. Sydney, Australia) and E. A. Munn. *Biochem J* 117(5):913-919, 1970.

Two mitochondrial populations from livers of embryonic and fed and starved adult female Wistar rats (150-200 g) were isolated and studied by isopycnic density-gradient centrifugation, enzyme assay, and electron microscopy. Mitochondria isolated from livers of fed adult, starved adult, and embryonic rats were separated on a sucrose density-gradient into 3 distinct bands, B1, B2 and B3 (mean buoyant density: 1.162, 1.184, 1.216, resp.). B1 consisted of disrupted and B2 and B3 of intact mitochondria. B2 and B3 mitochondria had similar protein/phospholipid ratios (approximately 4.4), virtually identical phospholipid and fatty acid compositions and similar specific activities for cytochrome oxidase, malate dehydrogenase and monoamine oxidase. Both B2 and B3 had very low glucose 6-phosphatase and acid phosphatase activities (90 and 80% less than control, resp.). An isolated, adult rat liver mitochondria had electron dense matrices (condensed forms) while some embryonic liver mitochondria were condensed, but a significant proportion had dilated matrices. All B2 mitochondria were in the condensed form while B3 mitochondria from adult rats were condensed if fixed in their equilibrium density sucrose, but when this was diluted rapidly to 0.25 M sucrose they became swollen. Some B3 mitochondria from embryonic rats were condensed while others had dilated matrices and they all became swollen if rapidly diluted to 0.25 M sucrose. The matrix space of B2 mitochondria appeared to be almost totally inaccessible to sucrose, but that of B3 mitochondria was readily accessible to sucrose. In fed adult rats, the B2 mitochondria predominated, whereas in starved rats B2 and B3 were present in approximately equal proportions. Mitochondrial preparations from embryonic liver consist mostly of B3 mitochondria, but the proportion of these decreases progressively as development proceeds. The B2 mitochondria of fed adult rat livers could be converted into B3 mitochondria by incubation with 10 mM succinate and 10 mM phosphate and some B2 mitochondria were converted into B3 mitochondria by exposure to high concentrations of sucrose.

5435 THE DISTRIBUTION AND RELATIVE LOCATION OF THE LYMPHATIC AND BLOOD VESSELS IN THE MUCOSA OF THE RABBIT COLON. *(E.)* Kamei, Y. (Nagoya City U. Med. Sch., Japan), *Nagoya Med J* 15(4):223-238, 1969.

The distribution and relative location of lymphatics and blood vessels were studied morphologically in the mucosa of the rabbit transverse colon, using conventional puncture techniques (india ink and Berlin blue as dyes), and intra-arterial injections of dyes or silver nitrate to locate lympatic vessels. Conventional puncture injection of dyes revealed that the arterial capillaries running longitudinally to the mucosal surface between the intestinal glands, turn towards a horizontally oriented venous capillary network below the mucosal epithelium, while the lymphatic capillaries are found only in the deep layer of the mucosa and form a horizontal network between the bottom of the intestinal glands and the muscularis mucosae. Intra-arterial injection of india ink with silver nitrate revealed that blood vessels consist of arterioles (20 - 20 μ) in the submucosa, precapillaries (12 - 20 μ) between mucosal intestinal glands, capillaries in the superficial mucosa, postcapillaries (20 - 40 μ) beneath the mucosal epithelium, and venules (40 - 80 μ). The larger diameter lymphatic capillaries also form a horizontal network which lies in the deep layer of the mucosa, and above the muscularis mucosae, the lymphatics form a coarse network surrounding the bottom of a few intestinal glands. Pairs of lymphatic vessels are seen in the submucosa running along both sides of a pair of blood vessels (artery and vein), but no lymphatic capillaries are present. The addition of pepsin to the intraarterially injected india ink revealed that the dye leaked out not only from the mucosal blood vessels, but also from the blood vessels of the submucosa, tunica muscularis and serosa.

5436 MACROMOLECULAR ASSEMBLIES OF LIPID IN BILE. *(E.)* Howell, J. I. (Roy. Free Hosp. Sch. Med., U. London, England), J. A. Lucy, R. C. Pirola and I. A. D. Bouchier. *Biochim Biophys Acta* 210(1):1-6, 1970.

Negatively stained specimens of natural and artificial solutions of bile were examined by electron microscopy in order to obtain data on the shape and size of mixed micelles of lipid and bile salts occurring in normal and pathological bile. Macromolecular assemblies having cigar-shaped profiles were present in all samples and were observed in both natural and artificial bile. These assemblies varied in size but were generally 0.1 µ in length and 0.02 µ in breadth. One of the two main kinds of macromolecular assemblies seen, which was present in both calculous and acalculous bile, apparently owed its characteristic appearance to the presence of bile salts, as similar structures were observed in the artificial bile. This assembly was interpreted in terms of a specific arrangement of disc-shaped, mixed micelles of lipid and bile salt molecules. The structure of the other assembly closely resembled that of liposomes which occur in dispersions of phospholipid and cholesterol free from bile salts. No significant differences were found between negatively stained preparations of calculous and acalculous bile. The growth of cholesterol-containing gall stones in pathological bile which is relatively deficient in bile salts may be associated with the presence of liposomes.

5437 IDENTIFICATION OF PHYLLOQUINONE IN HORSE LIVER.

(E.) Duello, T. J. (St. Louis U. Sch. Med., Mo.) and J. T. Matachiner. *Arch Biochem Biophys* 138(2):640-645, 1970.

The presence and distribution of Vitamin K in several metabolic forms was determined from lipid extractions of horse liver and by the characterization of phylloquinone. Fresh horse liver (160 gm) was ground, mixed with ethanol, and extracted five times with acetone; the acetone extracts were concentrated by distillation and partitioned between hexane and water. The concentration of vitamin K in the first four combined acetone extracts was 3.3 g/g, as determined by chick bioassay. The fat-soluble vitamin was purified by silicic acid and partition column chromatography, and finally by thin-layer chromatography. The vitamin was distributed between fractions which normally contain phylloquinone and all the biological activity was eluted with the radioactivity in the phylloquinone fractions, suggesting that the natural vitamin may be phylloquinone. The purified vitamin K was identified as phylloquinone by ultraviolet spectroscopy and mass spectrometry. The vitamin was identified by its molecular ion (m/e 450) and by other characteristic ions: m/e 435, 225, 198 and 186. Approximately 65% of the biologic activity eluted from silicic acid in fractions 2 and 3 was identified as phylloquinone. An isolation procedure using Claisen's alkali confirmed that 62% of the biological activity was due to phylloquinone.

5438 INTERCONVERTIBLE FORMS OF PHOSPHOFRUCTOKINASE OF RABBIT LIVER.

(E.) Ramaiah, A. (All-India Inst. Med. Sci., New Delhi) and G. A. Tejwani. *Biochem Biophys Res Commun* 39(6):1149-1156, 1970.

Rabbit liver phosphofructokinase, dissolved in 0.01 M K_2HPO_4, 0.05 M Tris-HCl, pH 7.5, 3.3 x 10^{-4}M EDTA and 10 mM ATP, stored at -70° exhibited classic Michaelis-Menten kinetics and gave a hyperbolic curve when activity rates at different fructose-6-phosphate (F-6-P) concentrations were determined by adding enzyme last. When the stock enzyme was diluted 10-fold with 0.1 M Tris-HCl, pH 8.0, containing 10 mM K_2HPO_4 and assayed at nonsaturating concentrations of ATP and F-6-P, it showed far lower activity (not due to inactivation by dilution) than the activity of the same amount of enzyme when assayed by adding the undiluted enzyme last, and gave a sigmoidal curve when the rates were determined after prior dilution of the stock enzyme and subsequent addition of F-6-P. The amount of F-6-P required for half maximal saturation of the catalytic site with F-6-P was about 0.05 mM when the velocity was determined by adding stock enzyme last, without any prior dilution of the enzyme, and 0.4 mM when the velocity was determined by adding the same amount of enzyme after 11.3-fold dilution. Phosphofructokinase in rabbit liver may exist in interconvertible forms, differing widely in their apparent K_m values for F-6-P, and F-6-P and other positive effectors may keep the enzyme in a form which has low apparent K_m for F-6-P.

5439 FINE STRUCTURAL LOCALIZATION OF PEROXIDASE ACTIVITY IN THE EPITHELIUM OF LARGE INTESTINE OF RAT.

(E.) Venkatachalam, M. A. (Boston City Hosp., Mass.), M. E. Soltani and H. D. Fahimi. *J Cell Biol* 46(1):168-173, 1970.

Segments of colon, duodenum, ileum, and stomach from male and female Charles River rats were used to study the fine structural localization of peroxidase activity in the mucus-secreting cells lining the crypts of rat large intestine. Under electron microscopy, the cells in the lower half of the colonic crypts contained an electron-opaque reaction product in the cisternae of the endoplasmic reticulum including those of the nuclear envelope. Wherease the staining was observed mainly in the granular endoplasmic reticulum, a few agranular segments also contained the reaction product. Some Golgi saccules, numerous Golgi vesicles, measuring 0.05 to 0.1 µ in diameter, and some larger membrane-bound granules (0.8 µ) stained prominently. In many cells, even in sections not counterstained with lead or uranyl acetate, free ribosome-like particles in the vicinity of endoplasmi reticulum and mucus droplets stained positively. In contrast to the colon, the gastric, duodenal, and ileal glands did not stain for peroxidase activity. Inhibition of staining by boiling, exclusion of H_2O_2, excess H_2O_2, and by azide suggested that the enzyme is most probably a peroxidase.

5440 AN APPRAISAL OF THE USE OF MONOAMINE OXIDASE AS AN ENZYME MARKER FOR THE OUTER MEMBRANE OF RAT LIVER MITOCHONDRIA.

(E.) Greenawalt, J. W. (Johns Hopkins Sch. Med., Baltimore, Md.) and C. Schnaitman. *J Cell Biol* 46(1):173-179, 1970.

Liver mitochondria isolated from adult male albino, Sprague-Dawley rats were used to study the use of monoamine oxidase as an enzyme marker for the outer mitochondrial membrane. Assays of aldehyde dehydrogenase activity showed that over 85% of this activity was recovered in the inner membrane plus matrix fraction, whereas 75% of the monoamine oxidase activity was found in the outer membrane plus soluble fractio

Chloral hydrate inhibited aldehyde dehydrogenase activity in the untreated mitochondrial fraction and in the inner membrane plus matrix fraction about equally (80%). Chloral hydrate showed no effect or monoamine oxidase activity while pargyline completely inhibited this activity. Addition of benzaldehyde to the standard spectrophotometric assay of monoamine oxidase activity caused no change in absorbancy, indicating that conversion of the aldehyde by the inner membrane plus matrix fraction did not take place. The rates of oxidation obtained with intact mitochondria versus the outer membrane fraction using tyramine-HCl as substrate for monoamine oxidase were essentially the same in the presence and absence of semicarbazide. The outer membrane fraction exhibited a 10-fold greater monoamine oxidase specific activity than did the inner membrane plus matrix fraction and a 3- to 4-fold greater specific activity than the mitochondria. Measurement of protein distribution in the various fractions showed that 90% of the total monoamine oxidase activity was recovered in the outer membrane plus soluble fraction.

5441 STUDIES ON THE MECHANISM OF FATTY ACID SYNTHESIS: XXIV. THE ACETYL- AND MALONYLTRANSACYLASE ACTIVITIES OF THE PIGEON LIVER FATTY ACID SYNTHETASE. *(E.)* Plate, C. A. (Duke U. Med. Ctr., Durham, N. C.), V. C. Joshi and S. J. Wakil. *J Biol Chem* 245(11):2868-2875, 1970.

By use of the transacylation of acetyl and malonyl groups from their CoA thioesters to *E. coli* acyl carrier protein to assay the acetyl- and malonyl-transacylase activities, investigations were made of the general and kinetic properties of these enzymes as they exist in the intact pigeon liver fatty acid synthetase complex; fractionation of the acetyl- and malonyltransacylase activities from the pigeon synthetase was also attempted. The transacylation of the acetyl and malonyl groups were catalyzed by the transacylase complex of the pigeon synthetase complex. Prior treatment with 0.25 mM *N*-ethylmaleimide inhibited the acetyl- and malonyltransacylase activities. It appeared that a sulfhydryl group was not directly involved in the transacylations of acetyl and malonyl groups to acyl carrier protein. Previous incubation of the synthetase with either acetyl-CoA or malonyl-CoA prevented the inhibitory action of *N*-ethylmaleimide. The acetyl- and malonyltransacylase activities were not affected by indoacetamide which totally inhibited triacetic acid lactone formation and fatty acid synthesis. Acetyl- and malonyltransacylase activities were competitively inhibited by malonyl- and acetyl-CoA, resp. Both activities were competitively inhibited by CoA with respect to *E. coli* carrier protein. The acetyl and malonyltransacylase activities were separated from the bulk of the synthetase protein by treatment of the synthetase with 0.5 M guanidine hydrochloride followed by diethylaminoethyl cellulose chromatography. Sephadex G-200 chromatography further separated the activities from the protein but very low yields were obtained. Separation of the malonyl- and the acetyltransacylase activities was not possible.

5442 THE MECHANISM OF SYNTHESIS OF FATTY ACIDS BY THE PIGEON LIVER ENZYME SYSTEM. *(E.)* Phillips, G. T. (Sterling Chem. Lab., Yale U., New Haven, Conn.), J. E. Nixon, J. A. Dorsey, P. H. W. Butterworth, C. J. Chesterton and J. W. Porter. *Arch Biochem Biophys* 138(2):380-391, 1970.

Peptic digestion of ^{14}C-acetyl- and ^{14}C-malonyl-labeled pigeon liver fatty acid synthetase complex indicates 3 major sites of binding of acetyl and 2 sites of binding of malonyl groups. Analyses of the chemical properties of these sites, when free and when esterified with acetyl or malonyl groups and analyses for the amino acids present in the peptides containing these sites, has led to their identification as the -SH groups of 4'-phosphopantetheine, cysteine, and the hydroxyl group of a hydroxyamino acid. From data on the sites of binding of intermediates to the fatty acid synthetase and the order of transfer from one site to another, it is postulated that in the reaction cycles that occur in fatty acid synthesis, each cycle would be initiated by the transfer of an acyl group from the 4'-phosphopantetheine prosthetic group to the cysteine site. At the same time, a malonyl moiety would be transferred from malonyl-CoA to the B_1 (hydroxyl group of a hydroxyamino acid) site and then to the 4'-phosphopantetheine site. A condensation reaction would then occur to lengthen the growing acyl chain by two carbon atoms. and the cycles would be terminated by deacylation of palmityl-enzyme to palmitic acid.

5475 INTESTINAL ABSORPTION OF CARNOSINE AND ITS CONSTITUENT AMINO ACIDS IN MAN. *(E.)*

Asatoor, A. M. (Westminster Hosp., London, England), J. K. Bandoh, A. F. Lant, M. D. Milne and F. Navab. *Gut* 11(3):250-254, 1970.

The serum levels of β-alanine and L-histidine were compared in two tolerance tests (spaced 2 weeks apart) in normal fasted adults after ingestion of the dipeptide carnosine (β-alanyl-L-histidine) and after equivalent amounts of the constituent free amino acids. Dosage of carnosine was 0.286 mmole/kg body weight, and histidine and β-alanine were taken together in an amount which would be produced by hydrolysis of the carnosine dose. Blood samples were obtained at zero time and at 15, 30, 45, 60 and 90 min after ingestion. The only abnormal symptom noted was a peripheral paresthesia in all subjects, 15 to 45 min after ingestion of carnosine or of the amino acid mixture. Neither β-alanine nor carnosine were found in basal serum specimens, but histidine concentration averaged 11.2 μmoles/100 ml (range: 8.6-17.0). In one typical subject the serum histidine level rose to a peak of 52 μmoles/100 ml, or to nearly 65 μmoles/100 ml, 45 min after ingestion of carnosine or of histidine and β-alanine, respectively. In the same subject, β-alanine serum levels rose to a peak of 40 μmoles/100 ml, or to 50 μmoles/100 ml, 30 min after ingestion of either carnosine or the amino acid mixture. In the period of 15-30 min after ingestion of the test substance, the maximum rate of increase in serum amino acid concentration was 1.25 times as rapid for β-alanine as for histidine in both tolerance tests, and the rate of decline after peaking was greater in β-alanine. The rate of rise in both serum β-alanine and of histidine in the 15-30 min period was 1.45 times as great after the amino acids than after carnosine. Repeated trials on the remaining subjects gave similar responses. It was concluded that absorption of both β-alanine and of histidine is significantly more rapid after ingestion of free amino acids than after ingestion of an equivalent amount of carnosine. The test results from normal subjects were compared with those obtained from a patient with Hartnup disease, in which β-alanine absorption was within normal limits after both carnosine and free amino acid ingestion, while histidine absorption was normal after carnosine, but greatly reduced after ingestion of the free amino acid. Serum histidine rate of increment in the case of Hartnup disease was 0.10 μmoles/100 ml/min after ingestion of the free amino acids, compared with 1.66 ± 0.57 μmoles/100 ml/min as a mean for the 5 normal subjects.

5476 MODIFICATIONS OF THE INTRACELLULAR INORGANIC ION CONTENT IN THE PRESENCE OF L-ALANINE IN THE JEJUNAL MUCOSA OF *TESTUDO HERMANNI HERMANNI* GMELIN. *(E.)*

Gilles-Baillien, M. (Dept. Biochem., U. Liege, Belgium). *Life Sci* 9(10 part 1):585-590, 1970.

When the results obtained in one fragment of the jejunal mucosa of *Testudo hermanni hermanni* Gmelin, set up in plexiglas chambers and incubated on both sides in saline, are compared to the results obtained in the symmetrical fragment incubated in a vial, short-circuiting the preparation (vial) gives lower values for the intracellular concentration of sodium and potassium while the chloride concentration appears to be less affected. When all fragments of jejunal mucosa are incubated for 4 hr in plexiglas chambers, the presence of L-alanine in the mucosal compartment induces a decrease in the intracellular concentration of potassium while sodium and chloride concentrations appear to be unaffected. When L-alanine is present only in the serosal compartment or in both the mucosal and serosal compartments the same result is obtained. Data are in agreement with the hypothesis previously proposed that the increase in the transserosal potential obtained in the presence of L-alanine results from an increase in the permeability to potassium of the serosal border of the epithelium. There was no stoichiometric relation existing between the release of potassium at the serosal border and the transfer of L-alanine through the epithelium; the influx (mucosal ⟶ serosal) of L-alanine is about 10 times greater than the outflux, and the decrease in the potassium concentration is approximately of the same magnitude when L-alanine is present either in the mucosal or in the serosal saline.

5477 EFFECT OF BILE SALTS ON THE GASTROINTESTINAL ABSORPTION OF DRUGS: II. MECHANISM OF THE ENHANCEMENT OF THE INTESTINAL ABSORPTION OF SULFAGUANADINE BY BILE SALTS. *(E.)*

Kakemi, K. (Fac. Pharm. Sci. Kyoto U., Japan), H. Sezaki, R. Konishi, T. Kimura and A. Okita.

The mechanism of the enhancement of the intestinal absorption of sulfaguanidine by bile salts, sodium taurocholate and sodium glycocholate, together with the poor absorbability of the drug itself was investigated, using the *in situ* single loop preparations in male Wistar rats. The effect of bile salts on the absorption of sulfaguanidine is divided into 2 stages: luminal phase and absorptive surface. In the luminal phase, bile salts do not affect sulfaguanidine's apparent partition coefficient to isopentyl alcohol at pH 6.5 (control: 0.280; sodium taurocholate: 0.275; sodium glycocholate: 0.271). Also bile salts do not affect its diffusion constant at pH 6.5 (control: 9.46 x 10^6 cm^2/sec; sodium taurocholate: 8.40 x 10^6 cm^2/sec). The decrease of sulfaguanidine in a dialysis bag was not affected by the presence of 20 mM sodium taurocholate. Sodium taurocholate did not affect the binding of sulfaguanidine to the intestinal mucosa. In an exsorption experiment, as the perfusion solution was changed to 20 mM sodium taurocholate, the exsorption rate of sulfaguanidine was markedly increased (.45 to 1.1 μg/min). In addition, as the bile salt solution was again changed to the simple buffer solution, the exsorption rate reduced to the control rate gradually. The enhancement of the absorption of sulfaguanidine seemingly is caused by the direct action of bile salts to the mucosal membrane, and that the effect was reversible.

5478 COMPARATIVE ASPECTS OF THE RESPONSE OF THE INTESTINE TO ITS IONIC ENVIRONMENT. *(E.)*

Robinson, J. W. L. (Canton Hosp., Lausanne, Switzerland). *Comp Biochem Physiol* 34(3):641-655, 1970.

Sodium ion sensitivity of L-phenylalanine, L-arginine and D-galactose uptake by rat, guinea pig, hamster and toad intestinal slices was compared. When sodium was replaced by potassium there was a drop in the absorption (μmoles/100 mg wet tissue) of phenylalanine, arginine and galactose (0.538 to 0.0468, 0.238 to 0.0380 and 0.209 to 0.0173, resp., for rats; 0.582 to 0.0427, 0.165 to 0.0397 and 0.357 to 0.0100, resp., for guinea pigs; 0.802 to 0.0633, 0.173 to 0.0504 and 0.764 to 0.0195, resp., for hamsters; and 0.410 to 0.0741, 0.186 to 0.0781 and 0.172 to 0.0230, resp., for toads). Replacement of the sodium with choline did not produce as large a drop in phenylalanine, arginine or galactose uptake (0.120, 0.169 and 0.0303, resp., in rats; 0.102, 0.120 and 0.0279, resp., in guinea pigs; 0.136, 0.171 and 0.0342, resp., in hamsters; and 0.782, 0.124 and 0.0281, resp., in toads). Preincubating intestinal tissue in a sodium-free, potassium- or choline-substituted medium prevented accumulation of phenylalanine presumably through an inactivation of the sodium pump but this effect was species-specific (with potassium affecting rats but not guinea pig tissue and choline similarly affecting guinea pig but not rat tissue and both sodium-free media affecting toad tissue). Substituting large anions for chloride also affected phenylalanine uptake by rat intestine with sodium benzene-sulfonate (1.270) lowering the uptake observed with sodium chloride (1.635) and with sodium sulfate lowering it even more (0.908); and with toad intestine the sulfate substitution lowered the chloride ion effect (1.070) to 0.830 while there was no change in the guinea pig.

5479 HISTOLOGICAL REEVALUATION OF EVERTED GUT TECHNIQUE FOR STUDYING INTESTINAL ABSORPTION. *(E.)*

Levine, R. R. (Boston U. Med. Ctr., Mass.), W. F. McNary, P. J. Kornguth and R. LeBlanc. *Europ J Pharmacol* 9(2):211-219, 1970.

The morphology of everted intestinal sacs of rats (utilized in intestinal absorption studies) was examined histologically. Immediately after eversion and preparation of the closed sac, the epithelial cells and villi showed normal architecture but after only 15 min of incubation at 37°C soft and pale tissue with distorted epithelial cells and edema (50-70% of normal epithelium was gone after 1 hr) was evident in tissues from decapitated rats while incubation at 23-24°C decreased the rate of tissue destruction (40-50% destruction after 1 hr). Tissues from rats anesthesized with ether or sodium pentobarbital (40 mg/kg) underwent a much slower destruction (10-15% after 1 hr of incubation) and tissues from golden hamsters incubated at 37°C exhibited interstitial edema but reduced numbers of fractured villi (40% after 1 hr) and at 23°C underwent slower and more moderate changes.

5480 INTERACTIONS BETWEEN LYSINE, Na^+ AND Cl- TRANSPORT IN RAT JEJUNUM. *(E.)*

Munck, B. G. (Inst. Med. Physiol. A., U. Copenhagen, Denmark). *Biochim Biophys Acta* 203(3):424-433, 1970.

Jejunal and ileal everted sac preparations were prepared in male albino rats and the unidirectional flow from the mucosal to the serosal side, and from the serosal to the mucosal side and the net fluxes were measured for L-lysine (10 mM), Na^+ and Cl^-. Transmural potential differences were calculated from the medium resistance and from the tissue resistance between two agar bridges, and from the current needed to reduce the potential difference between the bridges to zero. In the jejunum, in a Cl^- medium, the addition of L-lysine produced an average change of transmural potential difference of 0.3 ± 0.2 mV and a short circuit current of 4 ± 3 μA, compared with an ileal response of a change of potential difference of 0.9 ± 0.6 mV and a short circuit current of 11 ± 5 μA. When the Cl^- medium was substituted for by SO_4^{2-}, the jejunal response rose to the ileal level (potential difference = 1.0 ± 0.3; short circuit current = 12 ± 5 μA), but there was no significant change in the ileal responses. In the short-circuited jejunum, the L-lysine transport was active and Na^+ dependent, and associated with an increase in the net flux of Na^+ from the mucosal to the serosal side, both in Cl^- and in SO_4^{2-} media. In rat jejunum at a normal Na^+ concentration, a lysine concentration of 10 mM produced a significant L-lysine net flux of 0.22 ± 0.13 $\mu mole \cdot h^{-1} \cdot cm^{-2}$ in Cl^- medium, and 0.16 ± .008 $\mu moles \cdot h^{-1} \cdot cm^{-2}$ in SO_4^{2-} medium. Substitution of choline for Na^+ reduced the net flux to zero, resulting in an L-lysine net flux of -0.01 ± 0.02 $\mu mole \cdot h^{-1} \cdot cm^{-2}$. With the short-circuited jejunal preparation, L-lysine also increased the net flux of Cl^- from the mucosal to the serosal side, while in the short-circuited ileal preparation lysine did not influence the Cl^- net flux. In the absence of lysine the short-circuited jejunum exhibited a significant net Cl^- flux.

5481 AUTORADIOGRAPHIC INVESTIGATIONS OF THE DISTRIBUTION OF METALLIC ISOTOPES IN THE INTESTINE OF EXPERIMENTAL ANIMALS. A CONTRIBUTION TO THE ELIMINATOR FUNCTION OF PANETH'S CELLS. *(Ger.)*

Halbhuber, K. J. (Anat. Inst. Friedrich Schiller U., Jena, Germany), H. J. Stibenz, U. Halbhuber and G. Geyer. *Acta Histochem* 35(2):307-319, 1970.

The function of Paneth cells in the elimination of radioactive labeled metals (^{65}Zn, ^{60}Co, ^{203}Hg, ^{210}Pb, and ^{45}Ca) was studied in female rats, mice, guinea pigs, golden hamsters, and rabbits. Following the administration of $^{65}ZnCl_2$, the distribution Paneth cells was highest in the rat (5^+), moderate in the guinea pig and rabbit (2^+), and low in the mouse (+) with none in the hamster. ^{60}Co was localized in the Paneth cells (5^+) and goblet cells (+) of rats; Paneth cells ($2^+/3^+$), goblet cells (+) and Brunners's cells (+) of guinea pigs; goblet cells of the hamster (+); and Paneth cells (+) and goblet cells (+) of the mouse. $^{203}HgCl_2$ was distributed in the Paneth cells of the rat (4^+), guinea pig ($2^+/3^+$) and mouse (2^+), and ^{210}Pb was found in the Paneth cells of the rat (5^+), guinea pig (3^+) and mouse ($+/2^+$). ^{203}Hg and ^{210}Pb were also found in the pancreas, parotid gland and large intestine goblet cells and crypt cells in rats, guinea pigs, mice and hamsters. The Paneth cells of the small intestine seemingly play an important role in the elimination of metals.

5482 THE DIGESTION AND ABSORPTION OF PROTEIN IN MAN: I. THE SITE OF ABSORPTION. *(E.)*

Nixon, S. E. (Stracathro Hosp., Angus, Scotland) and G. E. Mawer. *Brit J Nutr* 24(1):227-240, 1970.

The absorption of amino acid components of two protein-containing test meals (15 g milk protein and 15 g gelatin) was studied in six healthy volunteers. In a control experiment a meal was given which contained a negligible amount of protein. The subjects were intubated with a single lumen tube, each meal was swallowed and intestinal residues were obtained from known levels. The amino acid composition of the intestinal contents was compared with that of the original meal and correction was made for net water shifts by reference to a non-absorbable marker compound (polyethylene glycol 4000). At least 70-75% of the milk protein test meal was absorbed when the sampling holes were 230 cm from the nose; most, if not all, of the meal was absorbed when the sampling holes were 140 cm from the nose. Amino acids were absorbed at rates proportional to their concentrations in the meal and gelatin was poorly absorbed from the region of the small intestine under study. Estimates of the amount of endogenous protein secreted in response to the test meals ranged from 2 to 8 g, equivalent to 13-53% of the protein containing test meals. The absorption of certain amino acids (the dicarboxylic amino acids) was more rapid than was expected; glutamic and aspartic acids were absorbed slowly from a mixture of amino acids, both *in vitro* and *in vivo*.

5483 THE DIGESTION AND ABSORPTION OF PROTEIN IN MAN: II. THE FORM IN WHICH DIGESTED PROTEIN IS ABSORBED.

(E.) Nixon, S. E. (Stracathro Hosp., Angus, Scotland) and G. E. Mawer. *Brit J Nutr* 24(1):241-258, 1970.

The mechanism of absorption of amino acids following a protein test meal and their rate of release in intestinal contents was studied in human subjects by determining amino acid levels in intestinal juice aspirated from various levels following a milk-protein meal. After fractionation and hydrolysis, fraction I demonstrated 2.5 μmoles/ml amino acid content after the low-protein meal and up to 8.5 μmoles/ml after the milk meal, compared to a 2.5-5.5 μmoles/ml range after the gelatin meal in fraction II. Lysine, valine, arginine, tyrosine, phenylalanine and methionine were completely digested and absorbed in the intestine. After 80 min incubation, over 90% of the acidic amino acids were peptide-linked. Glycine, threonine, serine and the amino acids' breakdown during incubation was not sufficiently rapid to allow for absorption in the free form.

5484 THE RELATIONSHIP BETWEEN MUCOSAL IRON AND IRON ABSORPTION IN THE GUINEA PIG.

(E.) Pollack, S. (Albert Einstein Coll. Med., Bronx, N.Y.) and T. Campana. *Scand J Haemat* 7(3):208-211, 1970.

Iron absorption and intestinal mucosal iron content was studied in 55 guinea pigs divided into iron-loaded and bled groups. Iron absorption was increased approximately 6-fold in bled guinea pigs as compared to control animals and the non-heme iron content of mucosal homogenates obtained from iron-loaded and bled animals was virtually identical. The hemeglobin contribution to the total iron of the homogenates was a maximum of 30% and the hemoglobin contribution to the total mucosal iron (heme + non-heme) was 0.08 ± 0.02 μg Fe/mg protein for the iron-loaded guinea pigs, and 0.04 ± 0.02 μg Fe/mg protein for the bled guinea pigs. There was no decrease in the iron content in the mucosa of the guinea pigs bled to produce a 6-fold increase in iron absorption. The iron content of the mucosa seemingly is not directly responsible for regulating iron absorption in the guinea pig.

5485 CURARE-LIKE AGENTS: RELATION BETWEEN LIPID SOLUBILITY AND TRANSPORT INTO BILE IN PERFUSED RAT LIVER.

(E.) Meijer, D. K. F. (Dept. Pharmacol., U. Groningen, Netherlands) and J. G. Weitering. *Europ J Pharmacol* 10(2):283-289, 1970.

Isolated perfused rat livers from male Wistar rats were used to study the biliary excretion of 6 bisquaternary ammonium compounds (alcuronium, dimethyltubocurarine, gallamine, hexafluorenium, pancuronium and d-tubocurarine). Thin-layer chromatography of bile samples showed that alcuronium, gallamine and pancuronium had a very low rate of excretion into the bile whereas hexafluorenium and d-tubocurarine appeared in the bile in much larger amounts. Extraction of these agents from aqueous solutions into octanol showed that insignificant amounts of alcuronium, dimethyl-tubocurarine and pancuronium were extracted while a low percentage of gallamine appeared in the organic phase. Only hexafluorenium and d-tubocurarine could be extracted from Krebs-Ringer solutions (pH 7.4) to a large degree indicating lipid solubility was high in spite of the polar nature of the drugs. Distribution of d-tubocurarine was influenced by the pH of the aqueous solutions; the concentration in octanol was very low at pH 5.0 and increased when the pH was raised. Extraction percentages increased parallel with the theoretical dissociation of a -OH group with a pK_a of 8.1; extraction of dimethyltubocurarine was very low at pH 5.0 and 7.4. Extraction percentages were considerably lower when the partition was performed with phosphate buffers instead of the Krebs solutions, especially in the case of hexafluorenium (51% for Krebs, pH 8.1; 3% for phosphate, pH 8.3).

5486 QUANTIFICATION OF THE BINDING TENDENCIES OF CHOLESTYRAMINE: III. RATES OF ADSORPTION OF CONJUGATED BILE SALT ANIONS ONTO CHOLESTYRAMINE AS A FUNCTION OF ADDED INORGANIC ELECTROLYTE CONCENTRATION, TEMPERATURE, AND AGITATION INTENSITY.

(E.) Johns, W. H. (Sch. Pharm., U. Connecticut, Storrs) and T. R. Bates. *J Pharm Sci* 59(6):788-793, 1970.

Studies of *in vitro* adsorption rates of conjugated bile salt anions to cholestyramine as a function of added inorganic electrolyte concentrations, temperature and agitation intensity were made in order to simulate the *in vivo* situation existing in the small intestine. A second-order kinetic model was found to represent the interaction data most suitably. The rate constants for the adsorption process decreased in the presence of increasing concentrations of sodium chloride, the reductive effect being more pronounced with the trihydroxy conjugates than with the dihydroxy

lerivative. Langmuir affinity constants paralleled
the apparent second order rate constants for systems
levoid of added inorganic electrolyte. The tempera-
ture studies showed that the calculated apparent
energies of activation indicated the existence of a
substantially lower energy barrier to the binding of
the dihydroxy glycine-conjugated derivative, glyco-
leoxycholate, than for its trihydroxy counterpart,
the glycocholate anion and variation in the intensity
of agitation had a more pronounced effect on the rate
of uptake of the glycodeoxycholate anion by the resin
han on the glycocholate anion. A log-log relation
existed between the second order interaction rate
onstant and the speed of agitation. The binding of
ile salt anions to cholestyramine apparently occurs
y means of a diffusion-controlled process.

487 AN *IN VITRO* MODEL FOR DRUG ABSORPTION
STUDIES. *(E.)* Robertson, J. S. (Dept.
harm., U. Sydney, Australia) and O. Bode. *J Pharm
harmacol* 22(6):423-426, 1970.

n *in vitro* experimental model for the kinetics of
ransfer of salicylic acid and some sulfonamides
rom an aqueous phase of pH 2 or pH 5 through an
ntervening organic phase to an aqueous phase of
H 7.4 was determined. The manner of operation of
his rotating cell promotes rapid drug transfer
ithout vortexing or emulsification of the phases.
alicylic acid (pK_a 2.97) was readily transferred
rom an aqueous phase of pH 2, through a cyclohexane
ayer to an aqueous phase of pH 7.4, where it was
lmost entirely ionized and trapped. The rate of
ransfer of the drug showed the anticipated pH depen-
ence; the concentration of unionized drug at pH 5
eing approximately 1%. Addition of 1% v/v octan-
-ol to the cyclohexane markedly increased the rate
f transfer indicating the influence of the polarity
f the organic phase. The results of transfer stud-
es using sulfacetamide showed it to behave similarly
 salicylic acid, whereas with both sulfadiazine and
lfadimidine there was a greater amount of drug
ansported at pH 5 than at pH 2. The apparatus de-
ribed apparently is satisfactory for studying the
ansport of drug molecules between aqueous phases
a a lipid phase.

88 CHANGES IN THE INORGANIC ION CONTENT OF
THE JEJUNUM MUCOSA IN CONDITIONS CAUSING
DIFICATIONS OF THE TRANSFER OF L-ALANINE (*TESTUDO
RMANNI HERMANNI* GMELIN). *(E.)* Gilles-Baillien,
 (Dept. Biochem., U. Liege, Belgium) and E.
hoffeniels. *Life Sci* 9(10 part 1):591-599, 1970.

mmetrical fragments of epithelium of the jejunum
cosa of *Testudo hermanni hermanni* Gmelin were
cubated in plexiglas chambers, and either bathed
 both sides by the usual saline and serving as a
ntrol or submitted to various changes in the
mposition of either the mucosal or the serosal
line. When 9/10 of sodium chloride in the mucosal
line was replaced isosmotically by sucrose the
dium and chloride content of the jejunum mucosa
s either not affected or affected very little,
t in contrast, the potassium concentration was
creased. When sodium chloride replacement occurred
 the serosal saline or in both salines, there was
again an increase in the potassium concentration, though generally less than in the first case and sodium and chloride were tremendously decreased. When 9/10 of the sodium ions were replaced in the mucosal saline by Tris ions, no modification at all was observed in the inorganic ion content. When 9/10 of the sodium ions were replaced in the serosal saline by Tris ions, an important decrease in the sodium concentration occurred while potassium and chloride concentrations were far less affected; however, there was generally a slight decrease in potassium and a slight increase in chloride. When 9/10 of sodium ions were replaced by Tris ions in both mucosal and serosal salines, there was also a very important decrease in the sodium content but potassium and chloride concentrations were not affected. When all chloride anions were replaced in equivalent amounts by sulphate anions no change occurred in sodium and potassium concentrations and the chloride content was tremendously decreased.

5489 SODIUM DEPENDENCY OF L-ALANINE ABSORPTION IN CANINE THIRY-VELLA LOOPS. *(E.)* Fleshler, B. (Case Western Reserve Sch. Med., Cleveland, Ohio) and R.A. Nelson. *Gut* 11(3):240-244, 1970.

L-Alanine absorption was studied in 7 dogs with Thiry-Vella intestinal loops injected with solutions containing L-alanine (10 or 50 mM), sodium (0, 74, or 145 mEq/l), and mannitol for 10 min; similar studies were performed for 5-min periods with solutions containing 50 mM L-alanine and either 0 or 140 mEq/l sodium. L-Alanine absorption at both 10 and 50 mM was significantly lower in solutions containing no sodium than in solutions with sodium. The absolute amount of L-alanine absorption was 74% and 63% for the 10 and 50 mM concentrations, resp., when the initial sodium concentration was zero. There was a shift of sodium into the luminal fluid when the initial sodium concentrations were 0 and 74 mEq/l; at 145 mEq/l, there was a net absorption of sodium with no change in luminal concentration. Exsorption was relatively constant regardless of sodium or L-alanine concentrations. Insorption rates for sodium were significantly lower from sodium-free solutions. At the 10 mM L-alanine level, insorption was increased only slightly when the initial sodium concentration was increased from 74 to 145 mEq/l; at 50 mM L-alanine, the increase in sodium was much more marked. Water secretion from the body pool into the gut lumen occurred at 0 and 74 mEq/l sodium; at 140 mEq/l, water secretion was in reverse proportion to absorption. In the 5-min study periods, significantly less L-alanine was absorbed from sodium-free solutions. The absolute amount of L-alanine absorbed from the sodium-free solution was 81% of that absorbed from the 140 mEq/l solution. Sodium concentration changes and water movement were similar to the 10 min test periods.

5490 INTESTINAL ABSORPTION OF HEMOGLOBIN IRON. *(E.)* Wheby, M. S. (U. Virginia Sch. Med., Charlottesville), G. E. Suttle and K. T. Ford, III. *Gastroenterology* 58(5):647-654, 1970.

Intestinal absorption of hemoglobin iron was studied after intragastric doses of ^{59}Fe hemoglobin or ferrous sulfate in iron-deficient and iron-loaded rats. More iron was absorbed from ferrous sulfate than from hemoglobin in both the iron-deficient (57% and 20%, resp., of the administered dose) and the iron-loaded (7% and 2% resp.) animals; deferioxamine (650 µg) premixed with the labeled hemoglobin iron (100 µg) did not change the absorption of iron-deficient animals indicating that the iron is not split from hemoglobin in the lumen of the rats. In duodenal loop studies after a dose of labeled hemoglobin (100 µg) no difference was found in the amount of heme split from hemoglobin in the lumen or in the amount of radioactive heme in the mucosa after 3 hr, but the iron-deficient rats had a more active heme-splitting mechanism (6.8% of the dose) than the iron-loaded rats (3.6%) and transported more iron (but no heme) from the mucosa into the carcass (5.4% compared to 1.7%). Activity for heme splitting, mucosal heme uptake and iron transport into carcass was greatest in the duodenum, decreased in the jejunum and was least in the ileum.

5491 EFFECTS OF FASTING ON INTESTINAL TRANSFER OF SUGARS AND AMINO ACIDS *IN VITRO*. *(E.)*

Newey, H. (Dept. Physiol., U. Sheffield, England), P. A. Sanford and D. H. Smyth. *J Physiol* 208(3): 705-724, 1970.

The effects of fasting on *in vitro* transfer of sugars and amino acids and on glucose metabolism were studied in everted sacs of jejunum and ileum in the rat. Mucosal transfer, serosal transfer and final serosal concentration were the parameters used for assessing transfer except for glucose, where metabolism was measured as the amount disappearing from the system during incubation and transfer determined from the difference between initial and final amount of glucose in mucosal fluid. The fasted rats with an initial weight of 240 to 260 g lost 46 g on the average, while the controls gained 5 g. The sac weights from the fasted animals also showed lower weight, the percent difference ranging from 20 to 36%. Mucosal transfer of glucose was considerably diminished by fasting at glucose concentrations of 7.5 and 28 mM while serosal transfer was enhanced (22-505%) at the lower concentration, with equivocal results at the higher glucose level especially in distal ileum. Fasting was found to depress (12-56%) glucose metabolism at all gut levels except distal ileum. Proline transfer in fasted animals was increased in the absence of glucose, whereas with glucose (7.5 mM) present reduced transfer occurred.

5492 EFFECT OF BILE ACID DECONJUGATION ON THE FECAL EXCRETION OF STEROIDS. *(E.)*

Kellogg, T. F. (Lobund Lab., U. Notre Dame, Indiana), P. L. Knight and B. S. Wostmann. *J Lipid Res* 11(4):362-366, 1970.

Total bile acid and neutral sterol fecal excretion were examined after saponification and thin layer chromatography in adult germfree and gnotobiotic (*Clostridium perfringens*-associated) rats. Total bile excretion (mg/kg/day) was 7.1 in the gnotobiotic animals with all the bile acids unconjugated and 11.3 in the germfree rats with all the acids conjugated with taurine. Cholic and α-muricholic acids were essentially evenly represented in both groups but β-muricholic acid was lower in the gnotobiotic group (23.6%) than in the germfree group (60.5%). The percentage of bacterially-modified bile acids excreted was lower in the gnotobiotic group (34.3%) than in the germfree group (57.7%) but total neutral sterol excretion was the same in amount (12.7 compared to 12.8 mg/kg) and character.

5493 STIMULATION OF AMINO ACID TRANSPORT IN RAT LIVER SLICES BY EPINEPHRINE, GLUCAGON, AND ADENOSINE 3',5'-MONOPHOSPHATE. *(E.)*

Tews, J. K. (Dept. Biochem., U. Wisconsin, Madison), N. W. Woodcok and A. E. Harper. *J Biol Chem* 245(11):3026-3032, 1970.

Amino acid transport in rat liver slices (Holtzman male albino rats) prepared from animals injected with hydrocortisone acetate, epinephrine, or glucagon, as well as amino acid transport modification in untreated rat slices by the addition of glucagon or epinephrine to the incubation medium were studied. Net transport of α-aminoisobutyric acid was increased in liver slices prepared from rats injected with hydrocortisone epinephrine, or glucagon (4.53 ± .21, 6.93 ± .50, 9.38 ± .47, resp.). When slices from untreated animal were initially incubated for 15 min with glucagon or cyclic AMP, subsequent uptake of α-aminoisobutyric aci was greater (30% and 40%, resp.) than in control experiments; epinephrine was without effect. Extended preliminary incubation with glucagon or cyclic AMP preceding the final incubation with aminoisobutyric acid potentiated the net increase in uptake 4 to 6 times that seen with a short preliminary incubation. 1-Aminocyclopentane-carboxylic acid transport in live slices *in vitro* was stimulated by glucagon, cyclic AMP, and epinephrine; therefore, these agents may directly affect hepatic amino acid transport *in vivo*. Aminoisobutyric acid uptake was relatively high (6.22 ± .16) in control liver slices after preliminary incubation for extended periods in Krebs-Ringer buffer alone and this effect was blocked by initially incubating the tissue in an ice bath (3.19 ± .14) or with cycloheximide (3.85 ± .16); actinomycin D was less effective. These drugs also inhibited cyclic AMP-induced stimulation of aminoisobutyric acid transport Amino acid analyses of extracts of incubated slices provided little evidence that exchange diffusion is o major significance in stimulation of aminoisobutyric transport by cyclic AMP.

5494 THE SIMULTANEOUS EMPTYING AND ABSORPTION OF ETHANOL FROM THE HUMAN STOMACH. *(E.)*

Cooke, A. R. (Roy. Prince Albert Hosp., Camperdown, Australia). *Amer J Dig Dis* 15(5):449-454, 1970.

Test meals of 350 ml containing phenol red and ethan (60 mg/ml) were instilled into the stomachs of 7 healthy subjects in order to study the emptying and absorption of ethanol from the stomach. Emptying wa allowed to proceed normally and the gastric contents were aspirated at different intervals on different days. Emptying was compared to water meals of equal volume containing no ethanol and emptying and absorption of 6% ethanol by the stomach were measured simultaneously at 5-min intervals up to 30 min. Emptying of 6% ethanol was exponential and did not differ significantly from that of water. About 85% of an ethanol meal and 90% of a water meal had left the stomach by 30 min and the amount of ethanol absorbed was related directly to the time present in he stomach. At 30 min, 6.42 g or about 8 ml of absolute ethanol was absorbed and less than 3 ml was left in the stomach and during this period about 16 ml of absolute ethanol had emptied from the stomach. The mean coefficient of ethanol absorption was .7 ml/min, and this was constant throughout the 30 min period. Acid output in response to ethanol eals was equal to that in response to water meals.

495 A CRITICAL STUDY OF THE CONCEPT OF MAXIMAL BILIARY TRANSPORT OF SULFOBROMOPHTHALEIN BSP) IN THE WISTAR RAT. *(E.)* Dhumeaux, D. (Hosp. eaujon, Clichy, France), P. Berthelot, A. M. Preaux, . Erlinger and R. Fauvert. *Rev Europ Etud Clin iol* 15(3):279-286, 1970.

aximal biliary transport of BSP in 41 rats with canulated bile ducts was examined by spectrophotometry, hromatography and bile salt determinations. BSP when nfused at rates 280 to 418 μg/min/100 g during 130 to 50 min exceeding the maximal biliary excretion rate, rogressively decreased (49±28%) the bile flow. BSP 282 to 325 μg/min/100 g) produced a decrease in ile salt output in bile (-80.8±12.8%). Sodium deydrocholate infusion (471 nmoles/min/100 g) increased oth bile flow (62%) and BSP excretion in bile (22%). here was a highly significant correlation between aximal excretion rate of BSP and initial bile flow $P < 0.001$).

496 THE PERIPHERAL ARTERIO-VENOUS DIFFERENCE OF SULFOBROMOPHTHALEIN CONCENTRATION. *(Fr.)* arbier, F. (U. Hosp., Ghent, Belgium), J. Versieck nd J. Tasson. *Rev Europ Etud Clin Biol* 15(3):294-98, 1970.

P was administered to 50 normal subjects (10 by nfusion, 40 by i.v. injection into the antecubital ein) to test for the existence of a peripheral teriovenous difference in BSP concentration. Arrial and venous samples were taken every 4 min ring the perfusion (18.75 mg/min for 20 min) and r 16 min afterward, and every 4 min for 44 min folwing a 5 mg/kg i.v. injection. The peripheral teriovenous circulatory delay resulted in a delayed pearance of a given brachial arterial concentration the antecubital vein. This accounted for a higher terial level during rising plasma concentration and higher venous level during falling plasma concenation. A higher infusion rate increased the A-V ncentration difference during a rising plasma contration. The i.v. injection of BSP produced a crease in A-V concentration difference when the sappearance rate of the dye from the plasma was ow. In one third of the cases the A-V concentration fference diminished steadily and the venous concenation curve finally crossed that of the arterial to 28 min after the injection.

5506 AN IMPROVED METHOD FOR STUDYING THE PERISTALTIC REFLEX IN THE ISOLATED COLON. *(E.)*

Frigo, G. M. (Dept. Pharmacol., U. Pisa, Italy) and S. Lecchini. *Brit J Pharmacol* 39(2):346-356, 1970.

An improved method of studying the peristaltic reflex was used in the guinea pig or cat isolated colon with a graded localized intraluminal stimulus consisting of a solid bolus. Advantages of this method are: 1) the stimulus is similar to that occurring physiologically in the colon, 2) the reflex can be elicited in various parts of preparation and thus allow a study of the effects of localized changes (example, removal of mucous membrane), 3) the behavior of circular musculature in relation to bolus position can be studied since solid bolus is propelled only when ascending contraction and descending inhibition occurs, 4) propulsive activity can be evaluated quantitatively. Velocity of propulsion, which is a reliable measure of propulsive activity, is dependent on degree of distention. In the guinea pig preparation, the average distention, which caused maximal velocity of propulsion, corresponded to 0.11 ± 0.0029 ml H_2O (82 experiments) injected into a balloon. Mean velocity at threshold volume was 0.55 ± 0.029 mm/sec (75 experiments), while mean maximal velocity was 1.51 ± 0.061 mm/sec (82 experiments). In the cat, mean threshold value of distention was 0.67 ± 0.016 ml (35 experiments). As in the guinea pig, velocity of propulsion increased when degree of distention was increased. Average distention causing maximal velocity was 1.64 ± 0.068 ml (42 experiments), while mean velocity was 0.38 ± 0.057 mm/sec (35 experiments) at threshold volume and maximal velocity was 1.08 ± 0.099 mm/sec (42 experiments). In the guinea pig, lowering of temperature progressively increased latent period and threshold of distention and it decreased rate of propulsion and degree of shortening of longitudinal muscle. Stimulation of pelvic nerves enhanced propulsive activity in both guinea pig and cat, while stimulation of periarterial nerves impaired propulsive contraction in both species. Since the peristaltic reflex could not be elicited from areas from which mucosal and submucosal layers had been removed, these layers are essential for triggering of peristaltic reflex and for propulsion of solid contents in colon.

5507 EFFECT OF INFUSION ON FORCE OF CLOSURE MEASUREMENTS IN THE HUMAN ESOPHAGUS. *(E.)*

Pope, C. E. II (VA Hosp., Seattle, Wash.). *Gastroenterology* 58(5):616-624, 1970.

Measurement of the pressure of peristaltic waves in the human esophagus was evaluated for accuracy and precision of wave patterns and amplitudes by using an infused catheter on 11 normal subjects and 36 patients with heartburn and/or dysphagia, alcoholism or diabetes. In a model constructed to compare actual pressure with the recorded pressure, infusion permitted accurate pressure tracings while uninfused catheters recorded pressures of from 30 to 80 mm Hg lower, but the rate of infusion was found to be critical with lower rates (0.8 to 14 µl/sec) causing plateau wave forms with increasing mean values as the rate increased, until at 40 µl/sec model pressure changes were accurately recorded. Using the infused catheter on normal subjects revealed a variation in pressure amplitudes between swallows (so that a mean of 5 readings was used), between locations along the length of the esophagus, and between normal individuals (although readings taken 3 times at 2 week intervals on the same individuals are fairly constant). Only 2/36 patients with esophageal symptoms had pressure tracings significantly different from those of the normal group.

5508 A PHARMACOLOGICAL ANALYSIS OF THE PERISTALTIC REFLEX IN THE ISOLATED COLON OF THE GUINEA-PIG OR CAT. *(E.)*

Crema, A. (Dept. Pharmacol., U. Pisa, Italy), G.M. Frigo and S. Lecchini. *Brit J Pharmacol* 39(2):334-345, 1970.

Segments of guinea-pig and rat large intestine were used to study pharmacological effects on the intact and denervated isolated colon. A localized intraluminal stimulus was used to elicit the colonic peristaltic reflex. The beginning of the propulsive movements was preceded by the contractile response of the longitudinal muscular coat. Tetrodotoxin, added to the bath containing the guinea-pig colon or infused in the arteries supplying the cat colon, inhibited all the components of the peristaltic reflex although the spontaneous motility of the preparations was only slightly affected. Bretylium (25 µg/ml) or piperoxan and propranolol (both 1 µg/ml) did not abolish the inhibitory response in the guinea-pig colon. Hexamethonium (10-50 µg/ml) also abolished all the components of the peristaltic reflex as did pentolinium (10-50 µg/ml). The longitudinal and circular reflex contractions in the guinea-pig were usually resistant to antimuscarine, antihistamine and antitryptamine drugs while in the cat they were abolished by antimuscarine drugs. Atropin and hyoscine impaired propulsion by selectively blocking the descending inhibition. Propulsive activity was not affected by sympathetic denervation and pretreatment with reserpine, but it was facilitated by pelvic nerve stimulation.

5509 INTESTINAL SMOOTH MUSCLES: DEMONSTRATION OF CATECHOLAMINE-INDUCED CONTRACTION MEDIATED THROUGH ALPHA-ADRENERGIC RECEPTORS. *(E.)*

Gagnon, D. J. (Ctr. Hosp. U., U. Sherbrooke, Quebec, Canada). *Europ J Pharmacol* 10(2):297-300, 1970.

Electronic recordings were made of the action of catecholamines on the isolated rat colon and its alteration by beta-blockade. Adrenaline, noradrenali and isoprenaline (3×10^{-9} to 1×10^{-7} g/ml) evoked dose-related relaxations when applied to the isolated colon. Noradrenaline was made more effective th adrenaline, especially at lower doses. Propranolol and trasicor (1×10^{-6} to 1×10^{-5} g/ml) prevented the typical inhibitory effect of the catecholamines and in the case of adrenaline and noradrenaline, completely reversed their effect producing dose-related contractions of the isolated colon. There wa no significant difference in the contractions produced by adrenaline and noradrenaline, although adr aline was slightly more potent than noradrenaline. Beta-blockade only prevented the isoprenaline-induced relaxations. Phentolamine (7.5×10^{-7} to 1×10^{-6} g/ml), depending on the dosage, completely prevented or greatly diminished the contractions in duced by adrenaline and noradrenaline after trasico Alpha receptors in the colon seemingly have a stimulating action.

5510 SEROTONIN AND INTESTINAL MOTILITY. *(E.)*

Hiatt, R. B. (Coll. Physicians Surgeons, Columbia U., New York, N. Y.), I. Goodman and N. I. A. Overweg. *Amer J Surg* 119(5):527-529, 1970.

The effects of Coherin (a hormome-like polypeptide from the posterior pituitary which has a powerful effect on intestinal motility) on intestinal reactivity to intraluminally administered serotonin was studied in 3 awake, trained dogs with fully functional Biebl loops. Serotonin (1 ml, 10^{-3} M) rarely produced changes in electromotor activity. Coherin (0.003 mg/kg, i.v.) produced increased voltage and coherence of the electrical pattern; increased motor activity was inconstant. When both Coherin and serotonin were given, there was a marked increase in electromotor activity with greatest effect seen when serotonin was given 70 min after Coherin. Stimulation of the mucosa with a 3 ml balloon inserted into the proximal portion of the loop produced the same results as serotonin in the Coherin-treated dogs. Similar results were obtained throughout the intra-abdominal alimentary canal including the stomach and the rectum. Marked motor activity could be demonstrated to coincide with the electrical patterns produced by a combination of intraluminal serotonin and i.v. Coherin.

5511 MEASUREMENT OF INTESTINAL TONUS. *(E.)*

Fleisher, D. R. (Ctr. Hlth. Sci., Los Angeles, Calif.). *Gastroenterology* 58(5):685-691, 1970.

ntestinal tonus was measured by examining the wall ension produced by distension (produced at a constant ate of inflow) using the equation for circumferential ension ($T \propto P\sqrt{T}$) in a latex viscus of variable wall hickness, in intact dog colon before and after morhine administration (0.3 mg/kg i.v.) and in isolated abbit colon before and after infusing sodium odoacetate (0.001 M). Previous methods of assessing olon tone (Lipkin et al. and Hopkins) proved indequate because erratic resistance curves or volume actor problems resulted, but using the constant inlow on a latex viscus revealed direct proportionality etween wall tension and thickness although the tenion produced was not dependent on the rate of inflow. n dog colon, the tension was rate-dependent (after nfusing approximately 65 ml tension was 75 μ at 56.8 ml/min compared to 50 μ at 31.4 ml/min) and orphine increased the tension capacity (75 μ before orphine to 410 μ after 65 ml at 156.8 ml/min) as ell as the tension differential between the rapid ate of infusion and the slower rate (difference 25 efore morphine and 160 after). In the isolated rabit colon, tension was again rate-dependent but the odoacetate decreased the tension capacity (210 μ o 55 μ after infusing 9.5 ml) as well as the tenion differential between the rapid and slow infusion ates (difference 135 before iodoacetate to 30 after). he size of the tension differential was related diectly to the level of tonus.

512 REACTIVITY OF THE DIGESTIVE TRACT TO PROSTIGMINE IN EXPERIMENTAL ANIMALS. *(E.)*

edzierska, L. Med. Sch., Wroclaw, Poland). *Arch mmun Ther Exp* 18(2):258-266, 1970.

he reactions of consecutive segments of the isolated igestive tract to prostigmine were studied by the method of Magnus in rabbits, guinea pigs and rats. Prostigmine generally increased tone and amplitude of contractions in most of the segments studied in the guinea pig (amplitude was unchanged in the ascending colon or taenia segments and diminished in the descending colon segment) and in the terminal segments of the small intestine in the rat while the tone but not the amplitude was increased in rabbits. The effect of prostigmine was exerted mainly on the longitudinal muscles and the effect was not always proportional to concentration in rats and rabbits.

5513 THE EFFECT OF TERBUTALINE (PINN) 1-(3,5-DIHYDROXYPHENYL)-2-(t-BUTYLAMINO)-ETHANOL ON THE CHOLEDOCHODUODENAL SPHINCTER. *(E.)*

Liedberg, G. (Dept. Surg., U. Lund, Sweden) and C. G. A. Persson. *Experientia* 26(4):388-389, 1970.

Pressure measurements of the common bile duct during constant rate saline perfusion through the choledochoduodenal junction were made in 25 young healthy cats receiving i.v. injections of terbutaline. A rhythmic activity independent of duodenal motility was found in the unstimulated sphincter. Sphincter activity was depressed and the resistance to flow was decreased in 20 of 25 cats receiving 0.5-4.0 μg/kg terbutaline; the other 5 cats had similar responses with 5-10 μg/kg. Isoprenaline (0.5-5.0 μg/kg) had a similar effect on the choledochoduodenal sphincter but differed from terbutaline in that it produced marked tachycardia and inhibited duodenal motility. Cholecystokinin in most cats increased the intestinal activity and relaxed the sphincter.

5514 EFFECT OF GASTRIN ON GASTRIC MYO-ELECTRIC ACTIVITY. *(E.)*

Kelly, K. A. (Mayo Clin., Rochester, Minn.). *Amer J Dig Dis* 15(5):399-405, 1970.

The effect of gastrin pentapeptide and synthetic human gastrin I (2.5 μg/kg s.c. each) on the pattern of gastric myo-electric activity was studied in 9 dogs following recovery from serial implantation of 8 electrodes from the fundus to the pylorus on the anterior serosal surface of the stomach. Both hormones increased the mean frequency of the gastric pacesetter potential from 5.2 to 6.0 cycles/min and also increased the mean incidence of bursts of action potentials associated with cycles of the antral pacesetter potential from 10 to 86%, but they did not consistently alter the velocity of the pacesetter potential propagation in the corpus (0.3 cm/sec) or antrum (1.7 cm/sec). The duration of the bursts of action potentials, 10 min after gastrin pentapeptide, was approximately 4 sec both in the corpus and in the antrum, but the width of the caudally progressing band of action potentials was greater in the antrum (3-6 cm) than in the corpus (less than 3 cm). The onset of changes in the pattern of electrical activity occurred within 2 min after an i.v. infusion of gastrin pentapeptide (0.1 μg/kg/min) was started, and the effects began to subside between 3 and 5 min after the i.v. infusion was stopped. Gastrin appears to enhance gastric motility through specific effects on gastric electrical activity.

5515 THE INFLUENCE OF SEROTONIN AND HISTAMINE ON CONTRACTILITY OF THE SMOOTH MUSCLE OF THE DIGESTIVE TRACT IN EXPERIMENTAL ANIMALS. *(E.)*

Kedzierska, L. (Med. Sch., Wroclaw, Poland). *Arch Immun Ther Exp* 18(2):239-257, 1970.

Isolated segments of rabbit, guinea pig and rat digestive tract were used to study the influence of histamine and serotonin on smooth muscle contractility. Portions of the stomach (rat) as well as small and large intestine were included for investigation. Guinea pig intestine was very sensitive to histamine in comparison with that of the rat and rabbit and histamine exerted a strong influence on contractility of rabbit taeniae and on the circular and middle segments of small intestine as compared with the other segments studied (duodenum, post-duodenum, ileum and colon). The guinea pig gut sensitivity to histamine was high, although stimulation pertained only to tone, which was especially evident in the small intestine. Histamine exerted virtually no effect on isolated segments of the rat digestive tract, although it strongly increased tone of the rat stomach. Serotonin increased muscle tone in all 3 species studied but caused weaker amplitude changes than histamine. Serotonin exerted its greatest effects on the rat stomach and proximal small intestine, and this species showed the greatest sensitivity to serotonin.

5516 THE EFFECT OF SECRETIN AND CHOLECYSTOKININ-PANCREOZYMIN ON THE INTRALUMINAL PRESSURE OF THE JEJUNUM IN THE UNANESTHETIZED DOG. *(E.)*

Farrar, J. T. (Med. Coll. Virginia, Richmond) and M. Ramirez. *Amer J Dig Dis* 15(6):539-544, 1970.

The effect of i.v. cholecystokinin-pancreozymin and secretin on intraluminal pressure in the jejunum was measured in 5 unanesthetized dogs, prepared with a modified Mann-Bollman fistula. Intrajejunal pressure was recorded by strain gauge manometer from a balloon placed in the small intestinal fistula. Dogs were fasted for 12 hr and following a 10 min baseline period, either cholecystokinin-pancreozymin (0.4 units/kg and 0.1 units/kg) or secretin (1.0 units/kg and 0.25 units/kg) in a 5 cc diluent was injected i.v., and a 10 min record was obtained. Two experiments on each of 5 dogs were performed with each dose of the test substances and two control studies were performed on each dog, using 5 cc saline instead of the hormones. Both doses of cholecystokinin-pancreozymin caused quantitatively equal increases in amplitude and frequency of jejunal contractions. At 0.1 and 0.4 units/kg, the intraluminal pressure increased from a saline control level of 22 mm Hg to a maximum of 44 mm Hg, and the number of waves increased from a control level of 5/min to a maximum of 8/min. The pressure and frequency responses occurred within 30 sec following injection, and began to return to control levels within 10 min. Secretin, at a dose of 1.0 unit/kg, inhibited pressure waves by reducing intraluminal pressure from a control maximum of 45 mm Hg to less than 5 mm Hg, and by reducing frequency of contractions from a control level of 7/min to less than 1/min. The decreases in jejunal pressure waves caused by secretin at 1.0 units/kg occurred within 2 min after injection and persisted for 18 min. The lower dose of secretin (0.25 unit/kg) similarly inhibited pressure waves, but a steady recovery of activity was observed within 5 min after injection.

5517 THE EFFECTS OF ADRENALINE, NORADRENALINE AND ISOPRENALINE ON INHIBITORY α- AND β-ADRENOCEPTORS IN THE LONGITUDINAL MUSCLE OF THE GUINEA-PIG ILEUM. *(E.)*

Kosterlitz, H. W. (Dept. Ther., U. Aberdeen, Scotland), R. J. Lydon and A. J. Watt. *Brit J Pharmacol* 39(2):398-413, 1970.

Two preparations, a segment of guinea pig ileum and the myenteric plexus-longitudinal muscle preparation, were used to analyze the inhibitory effect of adrenaline, noradrenaline and isoprenaline on the contractor responses of longitudinal muscle to acetylcholine or to electrical, coaxial or field stimulation. Response to electrical stimulation were completely suppressed by adrenaline or noradrenaline (.5 to 1 μM) but only partly inhibited (20 to 40%) by isoprenaline (.5 to 1 μM). Propanolol (.85 μM) antagonized the effects (mean dose ratios: 1.3 ± 0.1, 3.2 ± 0.6, 7.8 ± 0.7) of adrenaline, noradrenaline and isoprenaline, resp. However, phenoxybenzamine antagonized most of adrenaline's effect and to a lesser extent that of noradrenaline (mean dose ratio: 3.6 ± 0.3 and 2.0 ± 0.5, resp). Inhibitory effects of the 3 catecholamines on acetylcholine induced contractions were not affected by phenoxybenzamine but were antagonized by propanolol indicating that β-adrenoceptors are present on the muscle cells. The output of acetylcholine evoked by electrical stimulation was diminished by adrenaline or noradrenaline but was not affected by isoprenaline. The depressant effect on acetylcholine release was antagonized by phenoxybenzamine but not propanolol; therefore suggesting that these effects of adrenaline and noradrenaline are mediated by α-adrenoceptors. α-Adrenoceptors *in situ* seemingly are stimulated mainly by circulating adrenaline and possibly noradrenaline and thus probably cause a prejunctional inhibition at the nerve-smooth muscle junction.

5518 GASTRIC MOTOR AND INHIBITOR RESPONSE TO STIMULATION OF THE SYMPATHETIC NERVE IN THE DOG. *(E.)*

Nakazato, Y. (Fac. Vet. Med., Hokkaido U. Sapporo, Japan), K. Saito and A. Ohga. *Jap J Pharmacol* 20(1):131-141, 1970.

The motor responses of the fundus and corpus of the dog's stomach to stimulation of peripheral splanchnic and periarterial nerves, and to gastric arterial injections of noradrenaline and isoproterenol were analyzed comparatively using atropine, hexamethonium, bretylium, guanethidine and pronethalol, with the vagal gastric response serving as a control. Adult fasted dogs were anesthetized with ether or pentobarbital, the femoral artery and cephalic vein were cannulated, and in etherized dogs the spinal cord was transected between C_1 and C_2 levels. Branches of right and left vagi were separated for central and peripheral stimulation, and the left greater splanchnic nerve and periarterial nerves were expose for preganglionic and postganglionic sympathetic sti ulation. There was no difference in response to vag stimulation or to gastric arterial injections of nor adrenaline or isoproterenol in dogs whose spinal cor was transected under ether anesthesia and in those with intact spinal cord and anesthetized with pentobarbital. The gastric motor responses to stimulatio of peripheral splanchnic or periarterial nerves depended mainly on the strength of stimulation and in 33 dogs were classified as: (A) relaxation, common

n low intensity stimulation in unatropinized animals;
B) biphasic response, consisting of initial contrac-
ion followed by relaxation; (C) contraction; (D) con-
raction with peristaltic-like waves. Stimulation at
igher intensity produced the peristaltic-like con-
ractions, which were abolished by atropine. The
aximum response was obtained by a stimulation fre-
uency of 20 to 30 pulses/sec, with or without
tropine. Gastric arterial injections of noradrena-
ine produced responses similar to those produced by
ympathetic nerve stimulation, with the exception of
he peristaltic-like contractions, and isoproterenol
njection usually caused relaxation. In the atropin-
zed dog, hexamethonium (5 to 20 mg/kg i.v.) markedly
educed or abolished type A, B and C responses, but
ad no effect on type D responses. In 13 of 15 atro-
inized dogs, all gastric responses to peripheral
planchnic or periarterial nerve stimulation were
arkedly reduced or abolished by bretylium (7 to
 mg/kg i.v.) or guanethidine (2.5 to 15 mg/kg i.v.).
 2 dogs the stimulation caused long-lasting con-
actions that were not reduced by the blocking
ents. The atropine-resistant contraction caused
 sympathetic nerve stimulation and by noradrenaline
s reversed to a relaxation by phenoxybenzamine
5 to 20 mg/ kg i.v.), and these relaxations were
duced or abolished by injection of pronethalol.
e motor responses of the atropinized dog stomach
 sympathetic stimulation and arterial injection
 noradrenaline may be mediated by α-receptors,
ile the relaxation may be mediated by β-receptors.

19 EFFECT OF SECRETIN ON SMALL BOWEL MYOELECTRIC ACTIVITY OF CONSCIOUS
ALTHY DOGS.

(E.) Code, C. F. (Mayo Clin.,
chester, Minn.) and J. Hermon-Taylor. *Amer J Dig*
s 15(6):545-550, 1970.

e effect of both the pure hormone form (Jorpes)
d the synthetic polypeptide form of secretin on
e myoelectric activity of the small intestine was
udied in 7 healthy, conscious dogs. Myoelectric
tivity, in the form of action potentials superim-
sed on the background pacesetter potential, was
corded for over a period of 4 months from chroni-
lly implanted platinum electrodes placed on the
stric antrum, along the duodenum and upper jejunum,
 the terminal ileum, and at the ileocecal junction.
servations were made on the conscious animal at
ying times (2-48 hr) following a meal of meat,
l following i.v. injection of either form of se-
tin or of saline. In 24-to 48-hr fasted dogs,
ion potentials were stimulated by injection of
retin. In all tests in fed and fasted animals a
ked inhibition of action potentials in the duo-
um occurred within 30 sec following secretin in-
tion at a dose of 1 U/kg, i.v., with no effect
 the normal frequency or velocity of the paceset-
. In fed dogs (2-4 hr after meat meal) an injec-
n of Jorpes natural secretin reduced the percent-
 of incidence of duodenal action potentials from
 to a minimum of 3% within 3 min post-injection,
ore returning to control levels within 25 min
t-injection. In fasted quinidine-treated dogs an
ection of synthetic secretin (1 U/kg, i.v.) re-
ed the percentage of incidence of action poten-
ls from a baseline level of 75% to less than 10%
hin 2 min post-injection, before returning to a
saline control level of 45% within 8 min post-injection. When Jorpes natural secretin (1 U/kg, i.v.) was given to dogs 2-4 hr after a meal, the inhibition of action potentials along the small intestine was more intense, more consistent and of longer duration in the duodenum and jejunum than in the ileum. In the small intestine of fed dogs, 5 min after injection of Jorpes natural secretin, there was a 90% inhibition of action potentials in the upper one-quarter of the small intestine, 80% inhibition in the second one-quarter, 70% inhibition in the third one-quarter, and only 30% inhibition in the lowest one-quarter. In the small intestine of dogs fasted and pretreated with bethanechol, secretin injection caused a reduction in the number of bursts of action potentials along the small intestine. In the upper one-quarter of the small intestine the number of bursts dropped from a baseline level of 13.0 ± 0.9/min to 3.6 ± 0.8/min; in the second one-quarter the reduction was from a baseline of 12.5 ± 0.7/min to 4.1 ± 0.7/min; in the third one-quarter the counts dropped from 13.5 ± 0.8/min to 8.7 ± 1.2/min; and in the lower one-quarter the drop was from 12.5 ± 0.4/min to 10.9 ± 0.8/min. A gradient of diminishing inhibitory action of secretin on action potentials and on all motor activity extended throughout the small intestines.

5520 CONSIDERATIONS OF THE EFFERENT NERVOUS MECHANISM OF THE VAGO-VAGAL REFLEX RELAXATION OF THE STOMACH IN THE DOG.

(E.) Ohga, A. (Fac. Vet. Med., U. Hokkaido, Sapporo, Japan), Y. Nakazato and K. Saito. *Jap J Pharmacol* 20(1):116-130, 1970.

The nature of the efferent pathways participating in the vago-vagal relaxation of the stomach was studied in adult, fasted dogs (7 to 16 kg) in which bilateral splanchnic nerves were transected and the spleen and adrenal glands were removed. The peripheral end of the splanchnic nerve was used for sympathetic stimulation and periarterial nerves surrounding the celiac artery were prepared for post-ganglionic synpathetic stimulation. Gastric responses to nerve stimulation and to drugs injected i.v. or directly into a branch of the left gastric artery were recorded via a pressure transducer leading from a balloon positioned in the fundus and body of the stomach. Stimulation of the central end of the abdominal vagus nerve at frequencies above 5 pulses/sec produced mostly stomach relaxation in atropinized (0.05 to 2 mg/kg) dogs while peripheral vagal stimulation caused relaxation in the stomach of atropinized dogs. A low-frequency stimulation (1 to 5 pulses/sec) of peripheral vagal stimulation was more effective than central vagal stimulation in causing relaxation of the stomach and maximum gastric relaxation was attained at a rate of 20 to 50 pulses/sec in both vagal stimulations. Peripheral vagal stimulations rapidly induced gastric relaxation and produced a maximum effect in 10 sec after start of stimulation, while central vagal stimulation induced relaxation more slowly and reached a maximum effect in 30 sec after start of stimulation. Reserpine (2.5 to 4 mg/kg s.c.) and cocaine (3 to 5 mg/kg i.v.) had no effect on the inhibitory vagal responses. Bretylium (7 to 15 mg/kg i.v.) or guanethidine (2.5 to 5 mg/kg i.v.) abolished or greatly reduced the gastric response and the pressor response to sympathetic nerve stimulation, but only slightly reduced the gastric relaxation response to central or peripheral vagal stimulation. A low dose (5 mg/kg i.v.) of hexamethonium greatly reduced or abolished the gastric relaxation induced by central vagal stimulation, but the inhibitory response induced by peripheral vagal stimulation was reduced, but never abolished, even by high doses (22 mg/kg i.v.) of hexamethonium. The afferent valley from the abdominal vagus selectively induces reflex excitation of the preganglionic elements in the efferent vagal inhibitory pathway and the inhibitory ganglionic cell in this pathway may receive cholinergic preganglionic fibers and send nonadrenergic postganglionic fibers to the stomach.

5528 EVIDENCE OF GASTRIN-LIKE ACTIVITY IN THE RAT'S ANTRUM. *(E.)* Grahn, B. (Inst. Physiol., U. Lund, Sweden) and S. E. Svensson. *Experentia* 26(4):372, 1970.

The presence of gastrin activity in the rat antrum or duodenum was studied by measuring the flow of gastric acid secretions in rats with a Heidenhain pouch, following s.c. injection of preparations from antral mucosa. Pooled antral mucosa (2 to 3 g) from starved laboratory rats was homogenized, heated and centrifuged (2000 g for 5 min). The pellet obtained was resuspended in 1.5 vol of distilled water, was centrifuged again, and the combined opalescent supernatants were centrifuged at 80,000 g for 30 min. A clear extract was obtained with a histamine concentration of less than 1.7 g/ml (guinea pig ileum assay). Samples of 6 to 7 ml of the extract were chromatographed on a Sephadex G-25 column and eluted with 0.03 M NH_4HCO_3 at a pH of 8.0 and transmission at 254 nm of the eluate was recorded. Fraction samples were evaporated to dryness, dissolved in 1 Tyrodes' solution, injected s.c. in the rat, and th secretory response of acid was recorded for 30 min. A threshold dose corresponded to 0.1 g of hog gastrin II. The Sephadex chromatography of the ant extract resulted in separation into 2 peaks of gast activity. The major first peak appeared in the mac molecular fractions eluted immediately after the v volume (10 to 260 ml), and the second peak (contai ing a tenth of the total activity) was eluted at a larger volume (380 to 460 ml) and appeared in fractions containing low molecular weight substances. When pooled and concentrated, fractions of the fir peak were rechromatographed (a further separation into 2 peaks of gastrin activity occurred) and elu at similar volumes as were the 2 peaks of the orig extract. This suggests that the gastrin activity he extract may be bound to macromolecules forming a omplex which easily dissociates when the equilibrium s disturbed.

529 DIRECT INHIBITORY EFFECT OF ADENOSINE MONOPHOSPHATES ON Na^+-K^+-DEPENDENT ATPASE PRE-ARED FROM HUMAN GASTRIC MUCOSA. *(E.)* Mozsik, G. U. Med. Sch., Pecs, Hungary). *Europ J Pharmacol* (2):207-210, 1970.

he inhibitory effects of adenosine monophosphates n sodium and potassium ion-dependent ATPase prepared rom human gastric mucosa were measured. Cyclic ',5'-AMP (at concentrations from 10^{-13} to 10^{-5}M) reduced the ATPase activity (µmoles P_i/mg) from the ontrol value (1.64) to 0.83 at the highest concentration while 5'-AMP tested only at 10^{-11} and 10^{-8}M oncentrations lowered ATPase activity to 1.21 and 01 resp. and cyclic 2',3'-AMP tested at the same 2 oncentrations lowered it to 0.81 and 0 resp.

30 ACID GASTRIC SECRETORY RESPONSES TO HISTAMINE, CRUDE PORCINE GASTRIN AND PENTA-STRIN IN RATS. *(E.)* Amure, B. O. (Dept. Physiol., Ibadan, Nigeria) and A. A. Omole. *J Pharm armacol* 22(6):452-455, 1970.

e effects of histamine, pentagastrin and crude rcine and standardized gastrin on acid gastric se- etion was studied in rats (190 to 240 g). The rats re anesthetized by i.m. urethane and their stomachs re prepared for perfusion and continuous recording acid secretion. Injection of test compounds was de by means of a cannulated femoral vein. The andardized gastrin consisted of partially purified rcine gastrin previously assayed against pure strin II. A standard procedure using high and low ses of the standard and of test drugs in random der was adopted. Successive injections of the same se of the secretagogues increased the acid secretory sponses up to the third or fourth dose before a eady state was approached; assays were begun only er this time. Histamine at the 100 µg dose caused fall in pH by 2.60 units, while at 800 µg the pH ange leveled off at 3.20 units. Standardized strin in doses from 10 to 30 µg produced a pH change from 2.40 to 2.90 units, while the pH change in ponse to pentagastrin was from 2.10 to 2.60 at e levels of 6.25 to 25 µg. The acid response to tapeptide began after 2.0 to 3.5 min of injection recovery was complete within 1 hour. The log e response curves for the secretagogues used were allel and no marked differences in time-course ponse or pattern of stimulation were found. On a ar basis, pure gastrin possessed 3000 times the ency of histamine and was found to be 50 times e potent than pentagastrin, confirming that gastrin the most potent of the three stimulants.

1 INCREASED SUSCEPTIBILITY TO PROTEOLYTIC ACTION OF GASTRIC SUPERFICIAL MUCOSA AFTER LIC ACID RELEASE. *(E.)* Velican, C. (Inst. Intern ., Bucarest, Rumania), D. Velican, N. Marcus and Tacorian. *Amer J Dig Dis* 15(5):413-418, 1970.

Normoacid and hyperacid subjects were used to determine if a pH dependent, chemical extraction of sialic acid might occur in the superficial mucous layer of the gastric mucosa due to prolonged states of hyperacidity, and if the release of sialic acid could induce increased susceptibility of this mucin to proteolytic action. In the normoacid subjects the fundic superficial mucous layer showed a more or less intense and uniform basophilia with Alcian blue, pH 2.5. Absence of alcianophilia was seen only in 2 of 15 subjects. In 14 of the 15 subjects the Alcian blue reactivity of the superficial mucous layer diminished or disappeared after sialidase digestion. Treatment with 0.02 N HCl, pH 1.6, at 37°C for 1 hr resulted in the extraction of the Alcian blue reactive material from the superficial mucous layer in fresh sections. Digestion with pepsin and trypsin for 1 hr each and with papain for 6 hr did not result in a significant degradation of the fundic superficial mucous layer. In the hyperacid subjects, moderate, intense, diffuse or focal basophilia were not detected. The mucous material exhibited (as in the normoacid subjects) an intense PAS reactivity and stained only red with the Alcian blue, pH 2.5, followed by PAS sequence. The fundic superficial mucous layer displayed a decrease of sialic acid and was increasingly susceptible to proteolytic digestive action.

5532 MECHANISM OF GASTRIC ANTISECRETORY ACTIVITY OF A NEW FRACTION OF LICORICE ROOT (F_M100). *(E.)* Ishii, Y. (Res. Lab., Nippon Kayaku Co., Tokyo, Japan). *Jap J Pharmacol* 20(1):71-79, 1970.

The gastric antisecretory activity of a fraction of licorice root (F_M100) was investigated with respect to its mechanism of action, with special regard to gastrin release from rat antral mucosa. Acute fistula rats (200g), pylorus ligated rats and chronic fistula rats (> 250g) were used. Gastric juice from the acute rats was washed with saline each hour and titrated against 0.1 N NaOH with phenolphthalein indicator. Injection of a gastrin-like tetrapeptide, ACC-TP (500 µg/kg, i.m.), intragastric infusion of 20% ethanol or 1% acetylcholine (ACh) and mechanical stimulation (saline distension) were used as gastric stimulants. F_M100 had little inhibitory effect on AOC-TP induced secretion or local application of ACh, while secretion caused by ethanol or mechanical stimulation was markedly inhibited; atropine caused 100% inhibitory activity against ACh, ethanol, distension and methylcholine; F_M100 proved ineffective in blocking secretion from ACh and methylcholine (18.8% and 52.9%). Hexamethonium also exerted marked inhibition of ethanol, distension and AOC-TP induced secretion (100, 97.4 and 76.8%), while F_M100 showed 100%, 71.8% and 5.2% inhibition against the same stimulants. The licorice root fraction also inhibited secretion in antrectomized rats at about the same extent as in normal rats and had no effect on gastrin-like activity in antral mucosa. Results suggest that F_M100 blocks the process between mucosal receptors and ACh release and is probably different in action from anticholinergic and ganglionic blocking agents.

5533 POTENTIATION OF ACID OUTPUT IN MAN BY A DISTENTION STIMULUS. *(E.)* Cooke, A. R. (Dept. Med., U. Iowa, Iowa City). *Gastroenterology* 58(5):633-637, 1970.

Acid output in response to distention, i.v. histamine, i.v. pentagastrin and distention plus pentagastrin was studied in 7 healthy subjects using test meals of 5% glucose in water (375, 750 and 1500 m.) containing phenol red to produce gastric distention. Response to distention was significantly greater than basal acid output. Mean basal acid output was 1.68 ± 0.16 (S.E.) mEq/30 min compared to 4.51 ± 0.43, 5.97 ± 0.46, and 4.97 ± 0.47 mEq/30 min. For 375, 750, and 1500 ml distention, resp., mean peak acid output in response to 2 μg and 6 μg/kg/hr was 16.11 ± 1.14 and 17.33 ± 1.16 mEq/30 min resp., ($P > 0.1$). Mean peak acid output in response to histamine was not significantly different from that of pentagastrin ($P > 0.2$). Acid output in response to distention plus pentagastrin was significantly greater than to pentagastrin alone. Mean peak acid outputs for 2 and 6 μg/kg/hr plus distention were 25.69 ± 2.73 and 25.82 ± 1.87 mEq/30 min, resp. These responses were significantly greater ($P < 0.005$) than histamine. Studies indicate that potentiation occurs in man.

5534 THE INFLUENCE OF 2-(2,6-DICHLORPHENYLAMINO)-2-IMIDAZOLINE HYDROCHLORIDE (CLONIDINE) AND SOME RELATED COMPOUNDS ON GASTRIC SECTION IN THE ANESTHETIZED RAT. *(E.)* Waltz, A. (Dept. Pharmacol., Christian Albrechts U., Kiel, Germany) and P. A. Van Zwieten. *Europ J Pharmacol* 10(3):369-377, 1970.

The effects of various imidazoline derivatives (clonidine, naphazoline, xylometazoline, tolazoline, and phentolamine) on rat gastric secretion was studied. The rats (male Sprague-Dawley, 170 to 240 g) were anesthetized with sodium pentobarbital (50 mg/kg, i.p.) and a catheter was inserted orally into the stomach. A second catheter was introduced into the duodenum and attached to a pH-electrode. Relative changes in gastric acidity were recorded quantitatively. Clonidine (1 mg/kg, i.v.) induced a sharp increase in gastric acidity in the anesthetized rat; the time course of the effect was dose dependent. Pretreatment with atropine (5 mg/kg) and high doses of hexamethonium (10 mg/kg, i.v.) did not appear to affect the gastric acid production caused by clonidine. In a conscious Shay-rat preparation, clonidine (1 mg/kg, i.p.) caused a marked reduction in volume (1.11 ml/100 g body weight) and acidity (0.37 mEq/100 g body weight) in comparison with control values (3.08 ml/100 g and 1.52 mEq/100 g). Naphazoline was found to increase gastric acid production in a dose dependent manner in the anesthetized rat. Xylometazoline and tolazoline also increased gastric acid secretion with approximately the same time course as clonidine (1 hour). Phentolamine did not significantly alter the pH of the collected gastric juice. The inhibition of gastric secretion due to clonidine was seen in the unanesthetized state, whereas a histamine-like action of the drug is seen in anesthetized subjects and animals and is presumed to be of peripheral origin.

5535 THE EFFECT OF HEXAMETHONIUM ON GASTRIC ACID AND PEPSIN RESPONSE TO PENTAGASTRIN, HISTAMINE AND AHR-602. *(E.)* Nakajima, S. (Creighton U. Sch. Med., Omaha, Neb.) and D. F. Magee. *Europ J Pharmacol* 10(2):277-282, 1970.

The action of hexamethonium on gastric acid and pepsin responses to pentagastrin, histamine and *N*-benzyl-3-pyrrolidyl acetate methobromite (AHR-602), in 3 unanesthetized dogs with Heidenhain pouches and duodenal pouches with gastrojejunostomy which diverts gastric acid from the duodenum, was studied by acid titration. Hexamethonium (40 mg, s.c.) following pentagastrin (2 μg/min, i.v.), histamine (0.5 mg/hr, i.v.) and *N*-benzyl-3-pyrrolidyl acetate methobromide (250 μg/min, i.v.) augmented, depressed, and depressed, resp., gastric acid output after a plateau or steady state level of secretion had been reached. Pepsin responses to histamine and *N*-benzyl-3-pyrrolidyl acetate methobromide, the muscarinic ganglion-stimulating agent, were significantly depressed (-85% and -66.3% from control, resp.) by hexamethonium. Prolonged i.v. administration of histamine alone produced a significant increase in peps response, which had a characteristic latent period. The fact that hexamethonium, a competitive type of ganglion blocking agent, inhibits the acid and pepsi response to *N*-benzyl-3-pyrrolidyl acetate methobromi suggests that the mechanism by which pentagastrin stimulates the oxyntic cell is different from that c a muscarinic ganglion-stimulating agent.

SECRETION AND METABOLISM

Pancreas

5552 INHIBITION OF EXOCRINE PANCREATIC SECRETION BY GLUCAGON AND D-GLUCOSE GIVEN INTRAVENOUSLY. *(E.)* Nakajima, S. (U. Alabama Med. Ctr., Birmingham) and D. F. Magee. *Canad J Physiol Pharmacol* 48(5):299-305, 1970.

he action of glucagon (40 μg/min, i.v.) and D-glu-ose (40% solution, i.v.) on blood glucose and xocrine pancreatic secretion in response to i.v. nfusion of secretin was studied in unanesthetized dogs with chronic pancreatic fistulas, gastric fistulas, and a gastroenterostomy (which diverted gastric acid from the duodenum). Glucagon and D-glucose produced a significant increase in blood glucose levels with a concomitant decrease in pancreatic volume and output of protein, amylase, lipase and protease. There was a linear inverse relation between pancreatic enzyme output and blood glucose levels after glucagon or D-glucose infusion. The inhibition of pancreatic secretion by glucagon might be a secondary phenomenon owing to its hyperglycemic action.

5553 HISTONE CHANGES DURING DEGENERATION AND REGENERATION OF THE PANCREAS. *(E.)* Fitzgerald, P. J. (Downstate Med. Ctr., St. U. New York, Brooklyn), W. H. Marsh, M. G. Ord and L. A. Stocken. *Biochem J* 117(4):711-714, 1970.

Changes in the microstructure of histones from the pancreas were examined in Wistar rats given i.p. ethionine while being fed a protein-free diet (period of 7 to 8 days). When ethionine-treated rats returned to a stock diet, body weight and pancreas weight increased rapidly; previous ethionine administration had produced profound pancreatic degeneration. Thymidine uptake into DNA of pancreas increased after 2 days of refeeding with stock diet. Fifteen days after return to a stock diet, the total body weight of experimental animals had reached 85% of the weight of controls, pre-experimental pancreas weight was almost regained and the rate of DNA synthesis had returned to normal. Total RNA content of pancreas was decreased by approximately 40% after ethionine administration for 7 days; uridine uptake was decreased by 60%. After 2 days of refeeding, RNA synthesis increased and reached a peak at day 12. Phosphate content of histone F1 decreased after 7 days of ethionine treatment (74% of control), while an increased content was found after 3 to 4 days back on normal diet (152 and 144% of control). Similar changes in phosphate and thiol disulfide content of pancreas histones other than F1 were produced by starvation and refeeding. Phosphorylation of histone other than F1 seemingly precedes the phosphorylation of histone F1, and may be linked with new RNA synthesis.

Hepatobiliary Tract

5557 CONTROL FACTORS AFFECTING GLUCONEOGENESIS IN PERFUSED RAT LIVER: EFFECTS OF 4-PENTENOIC ACID. *(E.)* Williamson, J. R. (Johnson Res. Found., U. Pennsylvania, Philadelphia), S. G. Rostand and M. J. Peterson. *J Biol Chem* 245(12):3242-3251, 1970.

The metabolism of 4-pentenoic acid (PA) and the mechanism by which it inhibits gluconeogenesis were investigated in perfused rat livers. With the bile duct ligated, 4-pentenoic acid (1 mM) completely inhibited glucose production and pyruvate uptake but when the bile was collected a 2-fold higher concentration (2 mM) was needed for maximal inhibitory effects. Addition of 4-pentenoic acid (0.5 mM) following oleate (0.5 mM) resulted in utilization of 11 µatoms of oxygen/g liver and production of 2.5 µmoles/g liver of ketone bodies (stoichiometries substantiating metabolism of 4-pentenyl-CoA to acrylyl-CoA through a step of β-oxidation). Higher concentrations of 4-pentenoic acid added to perfusat with pyruvate (2 mM) decreased ketone body productio to 20% of the rate observed without substrate. 4-Pentenoic acid (2mM) caused oxidation of the mitochondrial and cytosolic pyridine nucleotides and NAD systems and at a lower concentration (1 mM) decrease CoA levels (400 to 80 nmoles/g) and carnitine levels (450 to 160 nmoles/g), acetyl-CoA levels (200 to 40 nmoles/g) and citric acid cycle intermediates (nmoles/g) malate (625 to 310), citrate (3750 to 30 isocitrate (125 to 26), and glutamate (13130 to 432 as well as the ratios of ATP:ADP (5.01 to 1.02), lactate:pyruvate (4.9 to 2.5) and β-hydroxybutyrate to acetoacetate (0.31 to 0.12) after 45 min. The i hibitory effects of 4-pentenoic acid on gluconeogen sis appear to be the result of altered allosteric control of pyruvate carboxylase and diminished rate of production and transport of reducing equivalents from mitochondria to cytosol.

5558 INTERACTION BETWEEN METHIONINE, FAT AND CHOLINE IN THE YOUNG RAT. *(E.)*

Clark, H. E. (Food Nutr. Dept., Purdue U., Lafayette, Ind.), G. S. Percival, S. H. Dunn and J. M. Howe. *J Nutr* 100(6):664-670, 1970.

The effect of different levels of choline and methionine and of choline and fat on growth and lipotropic activity was measured in male weanling Sprague-Dawley rats (50-55g). The factorial design of the first experiment included 3 levels of choline (0, 44 and 88 mg choline per 100 gm diet) and 3 levels of methionine (288, 374 and 547 mg per 100 gm diet) in diets containing 5% fat content; and in the second experiment, methionine content was maintained at 415 mg, while 5 levels of choline between 0 and 88 mg per 100 gm in diets containing 5%, 10% and 15% fat were administered. Six rats were assigned to each treatment for 4 weeks. Rats were then fasted for 4 hr, sacrificed, and liver and carcass nitrogen and liver choline concentrations were determined. In the first experiments, when data for all quantities of methionine were pooled, the concentration of hepatic choline of rats fed either 44 or 88 mg choline per 100 gm diet was elevated 30% and the concentration of lipid was depressed 30% below that of choline-deficient rats. Rats receiving 0 mg choline and 288 mg methionine per 100 gm diet had hepatic lipid content of 12.5% and a choline concentration of 1.80 mg/g, while rats receiving 88 mg choline and 288 mg methionine per 100 gm diet had a hepatic lipid content of 7.7% and a choline concentration of 2.43 mg/g. Dietary choline did not significantly influence food consumption, growth or nitrogen deposition. Increasing methionine concentration in the diets stimulated (P<0.01) food intake, weight gain, liver size, and nitrogen deposition in carcass and liver, and increased (P<0.05) the total amount and concentration (P<0.01) of choline in liver, but did not influence lipid concentration. When dietary choline was maintained at 44 mg per 100 gm diet, rats receiving methionine at 288 mg per 100 gm diet had a daily food intake of 10.1 gm/day, a weight gain of 2.4 gm/day, total carcass N of 5.76 g, total liver N of 44 mg, and total hepatic choline content of 11.5 mg, while rats receiving methionine at 547 mg per 100 gm iet had a daily food intake of 12.2 g/day, weight ain of 4.2 g/day, total carcass N of 8.24 g, total iver N of 221 mg, and total hepatic choline of 18.1 g. In the second experiment, increasing dietary fat rom 5 to 15% decreased (P<0.01) food intake, weight ain, and increased concentration of lipid, but not of choline in the liver. There was significant nteraction between dietary choline and methionine ith respect to weight gain and liver weight (P<0.05), nd between choline and fat in respect to lipid and oisture in fresh liver (P<0.01).

559 SPECIES AND SEX DIFFERENCES IN THE SUBSTRATE-INDUCED SPECTRAL CHANGE OF P-450 N RELATION TO THE ACTIVITY OF DRUG OXIDATION IN LIVER ICROSOMES. *(E.)*

Kato, R. (Natl. Inst. Hyg. Sci., okyo, Japan), K. Onoda and M. Takayanagi. *Jap J harmacol* 20(1):157-163, 1970.

The effect of species and sex differences on the spectral change of cytochrome P-450 (from liver microsomes) induced by hexabarbital and aniline was studied in rats, mice and rabbits. Cytochrome content (nmole/mg protein) was higher in male rats (0.96) than in females (0.72) but there was no difference between sexes in the mice (1.08 and 1.04) or in the rabbits (1.63 and 1.58). Spectral change (OD difference X 10^3/mg protein) produces by hexobarbital (1.6mM) was greater in male rats (17.9) than in females (7.0) but there were no differences between sexes in mice (8.1 and 8.4) or in rabbits (15.2 and 15.0), and the binding capacity of P-450 with hexobarbital (indicated by OD difference X 10^3/mμmole P-450) was high for male rats (18.6) but similar for both sexes of mice (7.5 and 8.1), rabbits (9.3 and 9.5) and for female rats (9.7). Aniline (2.0 mM) induced changes were greater in male rats (11.8) than in females (8.9) although there were no differences between the sexes in mice (13.7 and 13.9) or rabbits (19.2 and 18.2), and the binding capacity of P-450 with aniline was similar in both sexes of rats (11.3 and 12.4), mice (12.7 and 13.4) and rabbits (11.8 and 11.5). Hexobarbital hydroxylating activity (nmole/30 min per nmole P-450) was similar in all the animals (range of 41.9 to 53.4) studied except in the male rats (103.2) indicating the relation of the amount of bound substrate with P-450 to the sex and species differences in hydroxylating activity. Aniline hydroxylating activity nmole/30 min/nmole P-450) was higher in male and female mice (33.5 and 34.1 resp.) than in rats (21.2 and 21.7 resp.) and in rabbits (17.4 and 17.3 resp.) suggesting that the species difference is related not only to the amount of substrate—P-450 complex but possibly also to the rate of reduction of this complex by NADPH-cytochrome P-450 reductase.

5560 INITIAL INCORPORATION INTO RAT LIVER GLYCEROLIPIDS OF INTRAPORTALLY INJECTED [^{3}H]GLYCEROL. *(E.)*

Akesson, B. (Chem. Ctr., U. Lund, Sweden), J. Elovson and G. Arvidson. *Biochim Biophys Acta* 210(1):15-27, 1970.

Measurements were made of the incorporation of ^{3}H-glycerol into fractions of different degrees of unsaturation within different lipid glycerolipids in male Sprague-Dawley rats whose livers were removed 5 to 300 sec after the intraportal injection of 0.25 mC ^{3}H-glycerol in saline. The amount of isotope in phosphatidic acids and in diacylglycerols exhibited peaks at 20 to 30 and 30 to 60 sec, resp., while the labeling of triacylglycerols, phosphatidylcholines and phosphatidylethanolamines rose continually. About 1% of the total lipid radioactivity was found in other lipids. The turnover rates of different phosphatidic acids and diacylglycerols ranged between 0.022 and 0.055 sec^{-1}. Over the first 60 sec the distribution of radioactivity among different phosphatidic acids was constant and was close to that among diacylglycerols and the ratio between the rate constants for the conversion of dienoic and tetraenoic diacylglycerols into the corresponding phosphatidylcholines was 1:2. In the synthesis of phosphatidylethanolamines the ratio between rate constants for the conversion of dienoic and hexaenoic diacylglycerols was 1:20. The most unsaturated triacylglycerols exhibited a higher turnover rate than other triacylglycerols. Both in phosphatidic acids and diacylglycerols saturated-monoenoic, saturated-dienoic and highly unsaturated fractions constituted about 75% of the mass. In the three major phosphatidic acid fractions, saturated and unsaturated fatty acids amounted to approximately 50% each of the fatty acids.

5561 RATE OF RNA TURNOVER IN RAT LIVER IN RELATION TO INTAKE OF PROTEIN. *(E.)* Erwonwu, C. O. (Hlth. Sci. Dept., U. Washington, Seattle) and H. N. Munro. *Arch Biochem Biophys* 138(2):532-539, 1970.

The turnover of liver RNA was measured by following the rate of loss of label from liver ribosomal RNA after injection of ^{3}H-orotic acid (20-50 μC per animal i.p.) in rats fed normal and protein-deficient diets. Total liver RNA in rats given the normal diet (15g/day) rose 1%/day and radioactivity loss indicated a fractional degradation of 26%/day (the fractional rate of synthesis was 27%/day). Total liver RNA in rats on the protein-free diet (15g/day) decreased 3%/day and radioactivity loss indicated a 17% degradation (the fractional synthesis was 14%/day). When liver RNA turnover was examined during the transition period from an adequate diet to a protein-deficient diet, the decrease of total RNA occurred in 2 phases with a 10% drop/day for the first 2 days and a 5% drop/day thereafter compared to the steady 1% increase in the controls. Radioactivity loss was 43%/day (fractional rate of synthesis 33%/day) for the first 2 days and then dropping off to 15%/day compared to the steady loss in the controls of 21%/day (fractional rate of synthesis was 22%/day), indicating that the immediate loss of liver RNA after dietary protein deprivation is due to the sudden acceleration of RNA breakdown which then slows down to less than the control rate. Examination of ribosome aggregates in protein-deficient rats revealed decreased numbers of monosomes and disomes as well as lower total concentration/g liver.

5562 STIMULATION OF FETAL RAT LIVER TYROSINE AMINOTRANSFERASE ACTIVITY *IN UTERO* BY 3':5'-CYCLIC NUCLEOTIDES. *(E.)* Linarelli, L. G. (Mercy Hosp., Pittsburgh, Pa.), J. L. Weller and W. H. Glinsmann. *Life Sci* 9(9):535-539, 1970.

The effect of 3':5'-cyclophosphate esters of guanosine and inosine, 125 μg, the dibutyryl derivative of adenosine 3':5'-monophosphate, 125 μg, glucagon, 50 μg, or saline (control) on liver tyrosine aminotransferase activity was studied after i.p. administration to rat fetuses *in utero* 5 hr before cesarean section delivery. Guanosine and inosine 3':5'-monophosphate increased tyrosine aminotransferase activity in fetal liver and the increase was similar to that produced by glucagon or dibutyryl adenosine 3':5'-phosphate. An increase in the basal levels of liver tyrosine aminotransferase activity also occurred shortly after birth. The action of inosine 3':5'-phosphate on liver tyrosine aminotransferase activity, coupled with its activation effect on glycogen synthetase kinase in liver homogenates, indicates the primary importance of 3':5'-phosphodiester bond in the action of adenosine and guanosine 3':5'-monophosphate.

5563 THE EFFECTS OF CERTAIN BARBITURATES ON THE HEPATIC PORPHYRIN METABOLISM OF RATS. *(E.)* Moore, M. R. (Western Infirm., Glasgow, Scotland), V. Battistini, A. D. Beattie and A. Goldberg. *Biochem Pharmacol* 19(3):751-757, 1970.

The effect of 9 different barbiturates (Dial, allobarbitone, quinalbarbitone, barbitone, pentobarbitone, phenobarbitone, butabarbitone, thiopentone, and amylobarbitone) on hepatic porphyrin metabolism and hepatic δ-amino-levulinic acid dehydrase activity was measured in normal male Sprague-Dawley rats maintained on standard laboratory diet and given p.o. or i.p. injections of one of the barbiturates at anesthetic doses at 24 hr intervals for 6 days. Control animals received corresponding injections of saline. Following treatment, the livers were removed under ether anesthesia, chilled in cold saline, and aliquots were removed for enzyme and porphyrin assay. The parameters measured on each liver were weight, δ-amino-levulinic acid synthetase, δ-amino-levulinic acid dehydrase, coproporphyrin, and protoporphyrin. None of the barbiturates tested caused any significant change in liver weight or in rat body weight, however δ-amino-levulinic acid synthetase activity was elevated by all barbiturates. δ-Amino-levulinic acid synthetase activity was increased from a baseline level of 0.576 ± 0.208 μg/g/hr to 1.916 ± 0.259 by Dial, to 1.452 ± 0.124 by allobarbitone, and to 0.985 ± 0.84 - 1.440 ± 0.112 by all the other barbiturates. Hepatic δ-amino-levulinic acid dehydrase activity was increased only by Dial, from a control value of 11.34 ± 1.69 mg/g/hr to 13.48 ± 1.19 mg/g/hr. Hepatic coproporphyrin was elevated from a control level of 0.111 ± 0.050 μg/g to 7.50 ± 0.700 μg/g by Dial, and to 1.03 ± 0.610 μg/g by quinalbarbitone. The barbiturates were classified into 4 significantly different groups, based upon urinary coproporphyrin excretion. In the first group (Dial) the hepatic synthetase activity was greater than in the second group (allobarbitone and quinalbarbitone) ($P<0.001$); the activity in the second group was greater than in the third group (phenobarbitone, barbitone and pentobarbitone) ($P<0.05$) and the activity in the third group was greater than in the fourth group (thiopenton amylobarbitone and butobarbitone) ($P<0.001$), which was greater than activity in the control group ($P<0.001$). The results offer direct evidence for contraindication of any barbiturates in cases of porphyria.

5564 EFFECT OF CLOFIBRATE AND 1-METHYL-4-PIPERIDYL BIS (p-CHLOROPHENOXY) ACETATE (SANDOZ 42-348) ON STEROID AND DRUG METABOLISM BY RAT LIVER MICROSOMES. *(E.)* Salvador, R. A. (Wellcome Res. Lab., Tuckahoe, N. Y.), S. Haber, C. Atkins, B. W. Gommi and R. M. Welch. *Life Sci* 9(7):397-407, 1970.

The concentration of triglyceride in serum was reduced markedly in rats administered either clofibrate (0.25%), 1-methyl-4-piperidyl bis-(p-chlorophenoxy) acetate (Sandoz 42-348) (0.05%) or chlorcyclizine (0.01%) in the diet for 21 days. There was a smaller reduction in serum cholesterol in clofibrate and Sandoz 42-348 treated rats, which was unchanged in rats receiving chlorcyclizine. There was a small, but significant increase in serum cholesterol in rats treated with phenobarbital (0.05%), while serum triglyceride was unchanged in these animals. The concentration of phospholipid in serum was reduced only in rats administered Sandoz 42-348. Liver weight increased in rats receiving phenobarbital, clofibrate, or Sandoz 42-348. Clofibrate and Sandoz 42-348 induced in liver microsomes the formation of the enzyme system which metabolizes testosterone-4-C^{14} to more polar metabolites, while the enzyme systems which metabolize pentobarbital-2-C^{14} and 3,4-benzpyrene were not affected.

5565 OXIDATION OF CHOLESTEROL BY RAT LIVER MITOCHONDRIA: EFFECT OF N-γ-PHENYLPROPYL-N-BENZYLOXY ACETAMIDE. *(E.)* Kritchevsky, D. (Sch. Vetr. Med., U. Pennsylvania, Philadelphia) and S.A. Tepper. *Arzneimittelforschung* 20(4):584-585, 1970.

The hydroxylamine derivative, N-γ-phenylpropyl-N-benzyloxy acetamide (W-1372), when fed to male Wistar rats (average starting wt. 172 g) at the 0.3% level for 3 weeks caused slightly reduced weight gain and considerable enlargment of the liver. W-1372 did not affect serum cholesterol levels in these normocholesteremic rats, but distinctly reduced both serum triglyceride and phospholipid levels. The livers of rats fed W-1372 had somewhat higher levels of cholesterol and phospholipid than those of normal rats but their liver triglyceride levels were significantly higher. On the basis of oxidation per g of liver and on comparison of gross oxidation, suitably fortified mitochondrial preparations from livers of rats fed 0.3% W-1372 oxidized 24% and 74% more, resp., cholesterol-26-^{14}C to $^{14}CO_2$ than did normal preparations. When the levels of oxidation were compared on the basis of equivalent levels of mitochondrial protein, no difference was observed.

5566 INTERACTION OF DRUGS, STEROIDS AND FATTY ACIDS WITH LIVER-MICROSOMAL CYTOCHROME P-450. *(E.)* Kupfer, D. (Biochem. Inst., U. Stockholm, Sweden) and S. Orrenius. *Europ J Biochem* 14(2):317-322, 1970.

Microsomes isolated from livers of male Sprague-Dawley rats were used to study the interaction of various substances with the cytochrome P-450 containing monoxygenase system. The conversion of triamcinolone acetonide into 6β-hydroxy triamcinolone acetonide by rat liver microsomes supplemented with NADPH was linear with time, up to 30 min of incubation. A linear relationship was observed between the amount of 6β-hydroxy triamcinolone acetonide formed in 20 min of incubation and the concentration of liver microsomes in the range examined. A double reciprocal plot of the velocity of 6β-hydroxy triamcinolone acetonide formation versus triamcinolone concentration yielded a K_m of 140 μM. Triamcinolone acetonide, testosterone, and laurate interfered with the type I spectral changes produced by the addition of hexobarbital and ethylmorphine to microsomal suspensions that these substrates bind to a common cytochrome P-450 species. Substrates producing a type I spectral change with liver microsomes, enhanced the rate of NADPH-linked cytochrome reduction. Triamcinolone acetonide did not elicit a type I spectral change, did not stimulate the rate of cytochrome reduction but did interfere with the stimulation of this rate by hexobarbital and aminopyrine. Substrates of the liver-microsomal monoxygenase system studied seemingly interact with a single cytochrome P-450 species and the competitive inhibition they exert on each other's metabolism may be related to an interference with the binding to cytochrome P-450.

5567 INHIBITION OF LIVER AMYLASE SYNTHESIS BY CYANIDE: PROTECTIVE EFFECTS OF METHEMOGLOBIN AND THIOSULFATE. *(E.)* McGeachin, R. L. (U. Louisville Sch. Med., Ky.), B. A. Potter and R. M. Atherton. *Biochem Pharmacol* 19(3):663-667, 1970.

Inhibition of liver amylase synthesis by cyanide and protective effects of inhibition by methomoblobin and thiosulfate were studied in isolated perfused livers of Sprague-Dawley rats. Addition of 1-2 mg (2-4 x 10^{-4}M final concentration) of cyanide to perfusing blood had little effect on amylase production. (Normal amylase production is approximately +30 to +40 units/g of liver/4-hr perfusion period.) When 5-10 mg (10^{-3} to 2 x 10^{-3}M) amounts of cyanide were added, amylase synthesis was markedly or completely inhibited (+11.5 to -15 units/g liver). Lack of oxygen along with addition of cyanide further inhibited amylase synthesis (+1.9 to -7 units/g liver); addition of 10 mg cyanide (single dose) gave lower rates of amylase synthesis than when added in divided doses. Inhibiting effects of cyanide on amylase synthesis were blocked by addition of sodium nitrate to system; protective effect was apparently due to methemoglobin formation. Addition of sodium thiosulfate also afforded protection against toxic effects of cyanide. Ten mg of cyanide alone produced inhibition of amylase synthesis to -15 units/g of liver, but addition of 10 mg thiosulfate 5 min after 10 mg cyanide restored bile formation and eventually increased plasma amylase levels. Thiosulfate alone showed no marked inhibitory effects.

5568 EFFECT OF INDOSPICINE ON INCORPORATION OF L-ARGININE-^{14}C INTO PROTEIN AND TRANSFER RIBONUCLEIC ACID BY CELL-FREE SYSTEMS FROM RAT LIVER. *(E.)* Madsen, N. P. (Dept. Path., U. Melbourne, Australia), G. S. Christie and M. P. Hegarty. *Biochem Pharmacol* 19(3):853-857, 1970.

The effect of indospicine on incorporation of L-arginine^{-14}C into protein and transfer RNA by all free systems from rat (female Sprague-Dawley) liver was studied by liquid scintillation counting. A preliminary experiment to determine the effect of indospicine treatment of the whole animal on incorporation of ^{14}C-arginine into protein in a hepatic all-free system gave results (223 and 422 cpm/mg microsomal protein, treated and control rats, resp.) which, together with the depressed incorporation resulting from the addition of treated supernatant to control microsomes, suggested that a factor in the supernatant fraction of the treated rats was depressing incorporation of ^{14}C-arginine into protein in the all-free system. The microsomal RNA/protein ratio was unaltered by the treatment (mean values for 3 determinations: 0.132 for both control and treated groups), thus indicating that the microsomal fraction was not the site of inhibition. In the presence of indospicine (1.1 mM)^{14}C-arginine incorporation into protein in the all-free system was decreased (44%). The effect of indospicine was shown to be non-linearly concentration-dependent. As the amount of arginine in the reaction mixture was raised, the extent of the inhibition of incorporation due to indospicine was greatly reduced (indospicine (1.1 mM) and arginine (.071 mM), 44% inhibition; indospicine (1.1 mM) and arginine (2.83 mM), 2% inhibition). The formation of ^{14}C-arginyl-*t*RNA was inhibited by indospicine (10.0 mM) completely *in vitro* while formation of ^{14}C-leucyl-*t*RNA was not impaired.

5569 REGULATION OF GLYCOLYSIS IN BIOTIN-DEFICIENT RAT LIVER.

(E.) Mistry, S. P. (Dept. Anim. Sci., U. Illinois Urbana-Champaign) and A. D. Deodhar. *Life Sci* 9(10):581-588, 1970.

The regulation of glycolysis and the sites of enzyme involvement were studied in the livers of control and biotin-deficient rats. Biotin deficiency was produced in male Sprague-Dawley rats (35 to 40 g) by feeding an egg-white diet for 6 to 7 weeks, while control rats received 100 μg of biotin on alternate days. The activities of rate-limiting enzymes, and the levels of glycolytic intermediate products were determined by spectrophotometric and colorimetric methods in the rapidly frozen livers from control and biotin-deficient rats in the fed state. There was no significant change in the activity levels of glucokinase, phosphofructokinase and pyruvate kinase in biotin-deficient rat livers. However, pyruvate carboxylase activity (μmoles CO_2 fixed/g liver/min) in deficient livers was markedly decreased to 0.38 ± 0.04 from a control value of 4.36 ± 0.59. The levels of glucose-6-phosphate and fructose-6-phosphate were unchanged in deficient liver, but fructose-1,6-diphosphate and dihydroxyactone phosphate levels (nanomoles/g liver) increased to 58 ± 4 and 114 ± 14, resp., from control values of 28 ± 2 and 50 ± 4. Concentrations of 3-phosphoglycerate, 2-phosphoglycerate and phosphoenol-pyruvate were not changed in biotin-deficient livers, but pyruvate levels (nanomoles/g liver) rose to 1345 ± 188 from a control level of 188 ± 18, and lactate levels rose to 5100 ± 320, from a control value of 2508 ± 330. The increase of fructose-1,6-diphosphate levels, consequent to unchanged levels of hexose monophosphate, indicated an *in vivo* stimulation of phosphofructokinase. The citrate levels in biotin-deficient livers was lowered to 87 ± 8 nanomoles/g liver, which represented only 29% of the control value of 340 ± 21 nanomoles/g liver. The lowered citrate level was not adequate to exert control on phosphofructokinase activity. In addition to the primary block in pyruvate utilization, glycolysis seemingly is also enhanced in biotin-deficient rat liver.

5570 ACTION OF SOME ANTIBIOTICS ON THE EXTRA-HEPATIC BILIARY TRACT: VII. DICLOXACILLIN.

(E.) Benzi, G. (Dept. Pharmacol., U. Pavia, Italy) and E. Arrigoni. *Arch Int Pharmacodyn* 184(213-266, 1970.

The effects of dicloxacillin and several other antibiotics on the terminal bile duct were investigated in several animal species both *in vitro* and *in situ*. Dicloxacillin action was tested on the calf bile duct in the normal state, hypertonized by barium chloride (4.6 μg/ml), carbachol (0.13 μg/ml) or histamine (0.16 μg/ml) or pretreated with rifamycin on isolated gall bladders from the guinea pig and *in situ* bile duct preparations from the guinea pig, cat, dog and monkey was also studied. Dicloxacillin induced relaxation of the calf bile duct both in the normal and hypertonized states. Dicloxacillin (160 μg/ml) induced 60.5% inhibition against barium chloride compared with 15.2% against carbachol and 7.1% inhibition of histamine. In the isolated guinea pig and cat gall bladder, dicloxacillin (0.062-32 μg/ml), increased tone and motility of the normal organ. Perfusion of the antibiotic through the terminal duct of the guinea pig (2-256 μg/ml), cat (250-3000 μg/ml), dog (200-2000 μg/ml) and monkey (200-2000 μg/ml) induced an increase in biliary flow. Dicloxacillin was also found to reduce the constrictive action of rifamycin or erythromycin (125-500 μg/ml) and to enhance the relaxing action of ampicillin and aminosidin.

5571 QUALITATIVE AND QUANTITATIVE STUDIES ON THE METABOLISM OF A SERIES OF AROMATIC HYDROCARBONS BY RAT LIVER PREPARATIONS.

(E.) Sims, P. (Roy. Cancer Hosp., London, England). *Biochem Pharmacol* 19(3):795-818, 1970.

Livers from male rats injected i.p. with 5 mg of 3-methylcholanthrene 48 hr before decapitation were used for qualitative and quantitative studies on the metabolism of 11 tritiated hydrocarbons (phenanthrene, pyrene, chrysene, benzo[a]anthracene, dibenz[a,h]anthracene, dibenz[a,c]anthracene, benzo[a]-pyrene, benzo[e]pyrene, 3-methylcholanthrene, 7-methylbenz[a]anthracene and 7,12-dimethylbenz[a]-anthracene. Using liver homogenates of 3-methylcholanthrene-treated rats, the qualitative studies showed that all the major ethyl acetate-soluble metabolites of these hydrocarbons were accounted for and in most cases the structure of the metabolites was confirmed. The quantitative studies, using liver homogenates or microsomes from normal or 3-methylcholanthrene-treated rats, showed increases in the amounts of metabolites formed from the liver preparations of the treated animals as compared with those from the normal animals. Pyrene, chrysene, and benzo[a]pyrene were less readily metabolized than many of the other hydrocarbons. When the amounts of K-region dihydrodiol formed were expressed as percentages of the total metabolism, the carcinogenic hydrocarbons, dibenz[a,h]anthracene, benzo[a]pyrene, 3 methylcholanthrene, 7-methylbenz-

[a]anthracene and 7,12-dimethylbenz[a]anthracene yielded relatively less K region products than the inactive or weakly active hydrocarbons, phenanthrene, pyrene, benz[a]anthracene and benzo[a]pyrene. Repeated attempts to show the metabolic formation from chrysene of the K-region dihydrodiol, 5,6-dihydro-5,6-dihydroxychrysene were unsuccessful. The relative amounts of the K-region dihydrodiols formed by rat-liver homogenates were less than those formed by rat-liver microsomes.

5572 REGULATION OF PHOSPHOENOLPYRUVATE METABOLISM IN MITOCHONDRIA FROM GUINEA PIG LIVER. *(E.)* Garber, A. J. (Temple U. Sch. Med., Philadelphia, Pa.) and F. J. Ballard. *J Biol Chem* 245(9):2229-2240, 1970.

The regulation of phosphoenolpyruvate metabolism was studied in liver mitochondria of guinea pigs. 2,4-dinitrophenol reduced phosphoenolpyruvate formation owing to deficiency of intramitochondrial ATP and their reduction was not produced by simultaneous substrate level phosphorylation of GDP. Alterations (by ketone bodies) of the oxidation-reduction state of intramitochondrial pyridine nucleotides produced large changes in rates of phosphoenolpyruvate formation, citrate synthesis, and malate formation. The ultimate source of high energy phosphate for phosphoenolpyruvate synthesis seemingly is the intramitochondrial pool of ATP rather than the substrate level phosphorylation of GDP. The ATP/ADP ratio and kinetic behavior of nucleoside diphosphokinase controlled the rate and direction of phosphoenolpyruvate metabolism. A second control factor for phosphoenolpyruvate synthesis is the oxidation-reduction state of pyridine nucleotides acting upon the equilibrium between malate and oxalacetate.

5573 INHIBITION BY DEXTRAN SULFATE OF 2,4-DINITROPHENOL-ACTIVATED ADENOSINE TRIPHOSPHATASE IN ISOLATED RAT LIVER MITOCHONDRIA. *(E.)* Ogata, E. (1st Dept. Intern. Med., U. Tokyo, Japan) and K. Kondo. *Biochem Biophys Res Commun* 39(5):911-917, 1970.

Significant inhibition of 2,4-dinitrophenol-activated adenosine triphosphatase (DNP-activated ATPase) by low molecular weight dextran sulfate (1.2 mg/ml) was demonstrated in isolated rat-liver mitochondria in a sucrose medium. Similar inhibition was produced with dextran sulfate of high molecular weight. Inhibition depended not only on dextran sulfate concentration but also on that of ATP and was competitive between dextran sulfate and ATP on the active site(s) of DNP-activated ATPase. Dextran sulfate caused slight stimulation of basal mitochondrial ATPase in a medium lacking DNP: 0.20 ± 0.06 in absence, and 0.43 ± 0.08 (mean ± S.E., m = 4) μmoles/Pi/16 min/mg protein, in presence of 1.0 mg dextran sulfate/mg mitochondrial protein. Dextran sulfate produced a similar inhibition of ATPases activated either by other uncouplers or treatments that induced an energy-requiring cation translocation. ATPases activated by detergents, osmotic shock, or freezing-and-thawing were not affected by dextran sulfate. The effects of dextran sulfate were largely prevented or reversed by raising ionic strength or pH of reaction medium (addition of 0.3 mg of dextran sulfate per mg mitochondrial protein produced 73% inhibition at pH 6.9 and 46% at pH 7.5). Dextran sulfate seemingly interacts electrostatically with positively-charged loci on mitochondrial membranes, resulting in a decrease in ATP penetration across the mitochondrial membranes.

5574 MODIFICATIONS OF THE INCORPORATION OF TRITIATED URIDINE INTO HEPATIC RNA IN THE WISTAR RAT FOLLOWING PROLONGED ORAL ADMINISTRATION OF ETHANOL. *(Fr.)* Combescot, C. (Fac. Med. Pharm. Tours, France), M. T. Courte, F. Reynouard and J. Weill. *C R Soc Biol* 163(11):2410-2412, 1969.

The effect of prolonged alcohol administration on protein synthesis at the cellular level was studied in 80 rats, 50 of which had their pure drinking water replaced by a 9% ethanol solution for varying periods of time (8 days, 3 weeks, 1 month, or 3 months). Two hr before sacrifice, each animal received an i.p. injection of 0.5 mC of tritiated uridine. The mean number of silver particles (RNA) observed in controls was 50 per 300 hepatic cells, and in alcohol treated rats up to 700 particles per 300 cells were observed, revealing an increase in the synthesis of RNA in the hepatic parenchyma, seemingly due to adrenocortical stimulation.

5575 INCORPORATION OF VARIOUS HYDROGEN PRECURSORS INTO TOTAL FATTY ACIDS AND THE FATTY ACIDS OF DIFFERENT CELLULAR FRACTIONS OF THE PERFUSED RAT LIVER. *(Fr.)* Rous, S. (Inst. Med. Biochem., U. Geneva, Switzerland) and L. Aubry. *Bull Soc Chim Biol* 52(4):411-420, 1970.

Incorporation of precursors of fatty acids (tritiated and ^{14}C labeled glucose, succinate and acetate) was studied in perfused normally-fed rat livers. After equilibration, precursors were added to the perfusion medium, and livers were removed 30 min later to be immediately saponified in alcoholic KOH. Fatty acids were isolated from homogenized tissue, and their radioactivity measured. In total fatty acid synthesis, acetate was incorporated more than any of the labeled precursors; succinate incorporation was less than a tenth that of acetate, with tritiated glucose contributing minimally to fatty acid synthesis (but to an equal extent among forms tritiated at carbons 1 and 6, and 6-^{14}C glucose); 2-^{3}H acetate was utilized five times as much as 2-^{14}C acetate. Effects of excess NADH on tritiated succinate/^{14}C acetate ratio were not significant (the coenzyme inhibiting incorporation of both); excess NADPH produced significant change in this ratio, inhibiting only incorporation of tritiated succinate (the presence of a microsomal succinodehydrogenase could explain this). Of the cellular fractions, microsomes were involved in 50% of incorporation; mitochondria and supernate in the remainder. Ratios of specific activities of fatty acid/mg protein indicate that hydrogen atoms of succinate may be used for fatty acid synthesis in mitochondria, microsomes, and supernate.

5576 THE ENZYMATIC OXIDATION OF GLUTATHIONE IN RAT LIVER HOMOGENATES.

(E.) Jocelyn, P. C. (Dept. Biochem., U. Edinburgh, Scotland). *Biochem J* 117(5):947-949, 1970.

The nature of the oxidation of glutathione (GSH) added to rat liver homogenates (the mixture being incubated aerobically) was investigated. A loss in GSH of 0.77 ± 0.37 μmol/ml was observed 30 min after incubation at 37°C with a 10% homogenate in phosphate saline. The loss due to oxidized glutathione (GSSG) was prevented by previous dialysis of the homogenate (loss: 0.03 μmol/ml), addition of a protein free filtrate (loss: 0.08 μmol/ml), and previous heating (100°C) of the dialysed homogenate (loss: 0.07 μmol/ml). The aerobic oxidation of GSH was restored by a mixture of the protein-free filtrate and the dialysed homogenate (0.68 μmol/ml). The oxidation was not inhibited by EDTA, fluoride, azide or carbon monoxide (% loss of GSH: 95, 97, 101 and 100, resp.) but was inhibited by cyanide, arsenite and diethyldithiocarbamate (at high concentration) (% loss of GSH: 34, 49, 43, resp.). Addition of 2-amino-4-hydroxy-6-formylpteridine almost completely inhibited the oxidation (% loss of GSH: 9). With cysteine and homocysteine, both protein-free filtrate and dialysed homogenate separately induced more oxidation than that found in phosphate saline, but the oxidation induced by the mixture was greater still. Hypoxanthine, which has no effect on GSH in buffer, increased its loss when added to dialysed homogenate and to an extent that increased with increasing hypoxanthine concentration. As in undialysed homogenate, the GSH lost was quantitatively converted into GSSG, as shown by subsequent enzymatic reduction.

5577 THE METABOLISM *IN VITRO* AND HEPATIC MICROSOMAL INTERACTIONS OF SOME ENANTIOMERIC DRUG SUBSTRATES.

(E.) Hewick, D.S. (British Indust. Biol. Res. Ass., Carshalton, Surrey, England) and J.R. Fouts. *Biochem J* 117(5):833-841, 1970.

Hepatic microsomes from phenobarbitone-pretreated male rabbits were prepared to study enantiomers ((+)-amphetamine, (-)-amphetamine, (+)-benzphetamine and (-)-benzphetamine), that are metabolized at different rates, with respect to their microsomal difference spectra and their effects on cytochrome c reduction, cytochrome P-450 reduction and NADPH oxidation. (+)-Benzphetamine (.2-1.0 mM) was N-demethylated faster (30-35%) than (-)-benzphetamine, but the apparent Michaelis constants for the two enantiomers were similar, (.35 ± .05 mM and .30 ± .03 mM, resp.), (-)-Amphetamine was deaminated 200% faster than (+)-amphetamine. The benzphetamine enantiomers gave qualitatively and quantitatively identical type I microsomal difference spectra (peak, 433 nm; trough, 425 nm) indicating identical apparent binding affinities for microsomes and identical spectral changes at maxima ($\Delta E_{\max}$ values). The amphetamine enantiomers gave qualitatively identical type II microsomal difference spectra (peak, 433 nm; trough, 395 nm), but the type II spectral data indicated that (+)-amphetamine had a markedly higher apparent binding affinity than (-)-amphetamine for microsomes. The amphetamine enantiomers gave identical $\Delta E_{\max}$ values. The benzphetamine enantiomers (0.5 mM) enhanced the rate of microsomal cytochrome P-450 reduction by NADPH by 400-500%, (+)-benzphetamine enhancing the rate 20-25% more than (-)-benzphetamine. The amphetamine enantiomers decreased the rate of microsomal cytochrome P-450 reduction by NADPH. (+)-Amphetamine (2 mM) decreased the rate more (26% compared to 12%), than (-)-amphetamine. And all four enantiomers enhanced microsomal NADPH oxidation.

5578 PREMATURE FORMATION OF GLUCOKINASE IN DEVELOPING RAT LIVER.

(E.) Jamdar, S. C. (Harvard Med. Sch., Boston, Mass.) and O. Greengard. *J Biol Chem* 245(11):2779-2783, 1970.

The role of hydrocortisone acetate and additional factors in the regulation of the levels of glucokinase during its normal developmental accumulation and its premature formation was studied by enzyme assay of liver homogenates. Glucokinase that appears in normal rat liver after the sixteenth day (adult level-30 days) was evoked prematurely (.27 ± .09 units/g; adult level standard: 1.03 ± .04 units/g, a week earlier by 3 injections of hydrocortisone (50 μg/day for 3 days) followed by an injection of glucose. Hydrocortisone alone had a negligible effect on 9 to 10 day old rats. Thus, the prematurely evoked 0.27 unit of glucokinase after hydrocortisone and glucose injection do not accumulate gradually during the days of treatment but within 5 hr after the injection of glucose. During these 5 hr, concomitant RNA-synthesis is apparently required since actinomycin inhibited glucokinase activity (.05 ± .02 units/g). Insulin may also be required since an insulin inhibitor, mannoheptulose, also inhibited glucokinase activity (.07 ± .03). Estradiol, administered before (6 hr) each hydrocortisone injection, inhibited glucokinase activity (.08 ± .02 units/g), but given simultaneously with hydrocortisone was not inhibitory (0.22 ± .03) in 10 day old rats. The normal development accumulation of glucokinase was partially inhibited by adrenalectomy (0.14 ± .03; control: 0.33 ± 0.1), by preventing access to solid food, and by treatment with estradiol (at 25 days: 0.36 ± 0.08; control 0.64 ± 0.06). Adrenocortical secretion (known to increase after the tenth postnatal day) and the intake of solid food appear to be the physiological stimuli that trigger the formation of glucokinase in normal rats.

5579 SYNTHESIS OF CHOLESTEROL FROM GLUCOSE-$U^{14}C$ IN THE LIVER AND EXTRAHEPATIC TISSUES OF THE MOUSE.

(E.) Jansen, G. R. (Dept. Food Sci., Nutr., Colorado St. U., Fort Collins), M. E. Zanetti and C. F. Hutchinson. *Arch Biochem Biophys* 138(2) : 433-442, 1970.

The incorporation of glucose-U-^{14}C (20 μC p.o.) into cholesterol and other sterols (isolated by digitonin precipitation and separated by thin layer chromatography) of the liver and extrahepatic tissues was studied in mice fed a 20% corn oil diet and the same diet supplemented with 1% cholesterol or 1% cholestyramine. With the control diet, more labeled cholesterol (total cpm/mouse) appeared in extrahepatic tissue (4872) than in the liver (823) with 68% of the extrahepatic cholesterol appearing in the gastrointestinal tract, and 63% (4220) of the newly synthesized Δ^7-cholestenal being found in the skin. Dietary cholesterol reduced the level of labeled cholesterol in the liver by 90-98% (823 to essentially 0) and in the carcass by 35% (4872 to 3157) with an overall reduction of 45-55% (5695 to 3157); while dietary cholestyramine raised liver cholesterol 4- to 10-fold (823 to 10490) and carcass cholesterol by 60 to 70% (4872 to 8991).

5580 ETHANOL OXIDATION BY LIVER MICROSOMES: EVIDENCE AGAINST A SEPARATE AND DISTINCT ENZYME SYSTEM. *(E.)* Isselbacher, K. J. (Harvard Med. Sch., Boston, Mass.) and E. A. Carter. *Biochem Biophys Res Commun* 39(3):530-537, 1970.

Liver homogenates from female Sprague-Dawley rats were used to study the mechanism involved in the microsomal oxidation of ethanol *in vitro*. 3-AP-DPN was very effective as a cofactor in the microsomal oxidation of ethanol, yielding an activity of 83% when compared to TPNH. WHen 3-AP-DPN was substituted for DPN, the alcohol dehydrogenase (ADH) activity of the rat liver supernatant increased 4.5 fold. The *in vitro* addition of EDTA, pyrazole and ethanolamine resulted in a 92-100% inhibition of ADH activity and a 50% inhibition of microsomal oxidation of ethanol. While dimethyl sulfoxide and sodium sulfide produced a 50% inhibition of ADH activity and also a decrease in the microsomal oxidation of ethanol. Cyanide and azide (10^{-3}M) produced 100 and 75%, resp., inhibition of catalase activity; under these conditions the microsomal oxidation of ethanol was inhibited 80 and 33%, resp. Following the administration of 3-amino-1,2,4-triazole (1 g/kg i.p.) to rats *in vivo* there was a 90% decrease in hepatic catalase activity and a 54% inhibition of the microsomal oxidation of ethanol. The *in vitro* addition of potassium cholate (1.2 x 10^{-2}M) to the microsomal system produced an 80% inhibition of both TPNH oxidase and the microsomal oxidation of ethanol; under these conditions, potassium cholate had no effect on either ADH or catalase activities. The addition of $HgCl_2$ or $CuCl_2$ (2 x 10^{-4}M) to microsomal suspensions completely inhibited ADH, catalase, and TPNH oxidase activities, and also the oxidation of ethanol. The TPNH and O_2 dependent metabolism of ethanol by microsomes can be readily explained by the coupled and combined activities of TPNH oxidase, catalase and ADH.

5581 STIMULATION OF HEPATIC MICROSOMAL ANILINE p-HYDROXYLASE ACTIVITY BY DIMETHY SULFOXIDE (DMSO) ADMINISTRATION TO RATS. *(E.)* Stock, B. H. (Coll. Med., U. Iowa, Iowa City), A. R. Hansen and J. R. Fouts. *Toxic Appl Pharmacol* 16(3):728-739, 1970.

The effect of DMSO administration *in vivo* on the *in vitro* metabolism of aniline, benzphetamine and p-nitrobenzoic acid was studied in sham-operated and in adrenalectomized male Sprague-Dawley rats (170-230 g). Following treatment, all animals were sacrificed, the livers were removed, placed in 1.15% KCl buffered with 0.05 M Tris-chloride (pH 7.5) and subsequently homogenized and centrifuged to prepared microsomal fractions. The para-hydroxylation of aniline, and benzphetamine demethylation were measured and protein assays were made. In rat livers removed 24 hr after i.v. injection of 7.5 ml/kg of DMSO, the rate of para-hydroxylation of aniline in the 9,000 g supernatant was increased from a control level of 42.2 ± 1.3 mμmoles/mg/30 min to a value of 67.6 ± 2.5, and in the microsomes this activity was increased from a control value of 32.7 ± 0.2 to 50.4 ± 2.3. The DMSO injection caused no significant change in the rate of N-demethylation of benzphetamine, or the reduction of p-nitrobenzoic acid, or in the rate of benzpyrene metabolism. Groups of rats were injected with 7.5 ml/kg DMSO at either 24, 12, 6, 3, 1 or 0.25 hr before sacrifice, and the rate of aniline hydroxylation was measured in isolated microsomal fractions. There was a significant increase in aniline metabolism at 3 hr after injection, with an increase in microsomal p-aminophenol formation (mμmole/mg/30 min) from a control level of 32.7 ± 0.2 to 45.2 ± 2.2, which reached a peak effect in 6 - 12 hr, and returned to control levels 48 hr after injection. Administration of DMSO at an i.p. dose of 2 ml/kg twice a day for 3 days to sham-operated or to adrenalectomized rats produced a stimulation of aniline metabolism, but produced no changes in benzphetamine and p-nitrobenzoic acid metabolism or in P_{450} levels. The multiple dose DMSO treatment increased p-aminophenol formation (mμmoles/mg/30 min) in microsomes from control levels of 35.7 ± 1.3 in sham-operated rats and 32.1 ± 0.4 in adrenalectomized rats, to 66.3 ± 5.2 and 59.4 ± 0.6, resp. The multiple dose regimen produced higher levels of activity than the single dose treatment, and there was a dose-response relationship present in both treatment modes. Addition of DMSO directly to the incubation mixture did not stimulate, but rather inhibited aniline metabolism in concentrations greater than 0.02%.

5582 METABOLISM OF L-CARNITINE ESTERS OF β-SUBSTITUTED PALMITIC ACID BY RAT LIVER MITOCHONDRIA. *(E.)* Mahadevan, S. (Anim. Res. Inst., Canada Dept. Agric., Ottawa), M. Malaiyandi, J. D. Erfle and F. Sauer. *J Biol Chem* 245(12):3218-3224, 1970.

The properties and metabolism by rat liver mitrochondria of synthesized L-carnitine esters of β-substituted palmitic acid were investigated. The physical properties (elemental analysis, infrared and nuclear magnetic resonance data) of palmitoyl-L-carnitine (m.p. 151-154°C), β-ketopalmitoyl-L-carnitine hydrochloride (m.p. 121-123°C), β-hydroxypalmitoyl-L-carnitine (m.p. 142-145°C) and trans-2-hexadecenoyl-L-carnitine hydrochloride (m.p. 171.5-172.5°C) were in agreement with theoretical considerations. Incubation with mitochrondria revealed that the synthesized carnitine esters were oxidized more rapidly than the corresponding free fatty acids (in mμmoles acetoacetate/mg protein/20 min, palmitic 76.5 and 27, resp., β-ketopalmitic 82.0 and 12.4, resp., β-ketopalmitic 82.0 and 12.4, resp., β-hydroxypalmitic 39.2 and 3.0, resp., and α,β-unsaturated palmitic 34.0 and 1.3, resp.). Free acids did not stimulate respiration and oxygen uptake was similar for all the carnitine esters (73 to 75 mμg atoms/min/mg) except α,β-hexadecenoyl carnitine which was 30% lower (55.4). Acylcarnitine transferase activity studies revealed the β-keto derivative as efficient a substrate as palmitoyl carnitine (54.8 m moles/min/mg) while the β-hydroxy derivative was 30% lower and the α,β-unsaturated derivative was 80% lower. The β-ketopalmitic acid is nonspecifically and nonenzymatically decarboxylated in the presence of protein to yield pentadecanone.

5583 HEPATIC DRUG METABOLISM IN ZINC-DEFICIENT RATS. *(E.)*

Becking, G. C. (Res. Lab., Food Drug Directorate, Ottawa, Canada) and A. B. Morrison. *Biochem Pharmacol* 19(3):895-902, 1970.

Livers from male Wistar rats placed on zinc-deficient diets were used to study hepatic drug metabolism *in vitro*. Zinc-deficient rats exhibited weight loss, anorexia, decreased urinary excretion of ascorbic acid, and a prolonged pentobarbital sleeping time. There was no significant alteration in drug metabolism *in vitro* prior to 37 days on the zinc-deficient diet and at 37 days, the only change was a lowering of pentobarbital oxidation. There was also a gradual decrease in the rate of aminopyrine metabolism, but no significant alteration in the *N*-demethylation of aminopyrine occurred until 44 to 46 days on the zinc-deficient diet. Nitroreductase activity was significantly reduced after 58 days on the zinc-deficient diet and there was no alteration in the rate of ring hydroxylation at this time. The RNA and protein content of liver microsomes from zinc-deficient rats was essentially the same as in control animals and after 42 days, the cytochrome P-450 content of microsomes was significantly lower than that of the controls. There was no evidence of altered glucose-6-phosphate dehydrogenase or glucose-6-phosphate activities in zinc-deficient rats.

5584 THE EFFECT OF CHAIN LENGTH AND DEGREE OF UNSATURATION OF THE FATTY ACID SUBSTRATE ON THE OUTPUT OF TRIGLYCERIDE BY THE LIVER. *(E.)*

Kohout, M. (Inst. Cardiovasc. Res., Prague, Czechoslovakia), B. Kohoutova and M. Heimberg. *Biochim Biophys Acta* 210(1):177-179, 1970.

The isolated livers of normal male rats (220 to 280 g body weight) when infused *in vitro* with various free fatty acids in equimolar concentrations as complexes with bovine serum albumin at 0.195 ml/min for 4 hr showed triglyceride output that was related linearly to the number of C atoms in the straight-chain saturated fatty acid, with the output increasing as the number of C atoms increased (C_6-C_{18}). The triglyceride output by livers when fatty acid was not infused was not different from that when caproic or caprylic acid was infused, but when infused with any fatty acid having more than 12 C atoms the output was significantly higher. The output after infusion of lauric acid was about twice that obtained after infusion of C_6-C_8 fatty acids. The triglyceride output was also related linearly to the number of double bonds in the C_{18} fatty acid with the output decreasing as the number of double bonds increased. The release of triglyceride after infusion of linoleic and linolenic acids was considerably less than when stearic acid was used.

5585 REVERSIBLE INACTIVATION BY ELEMENTAL SULFUR AND MERCURIALS OF RAT LIVER SERINE DEHYCRATASE AND CERTAIN SULFHYDRL ENZYMES. *(E.)*

Pestana, A. (Ctr. Biol. Invest., CSIC, Madrid, Spain) and A. Sols. *Biochem Biophys Res Commun* 39(3):522-529, 1970.

Preincubation (10 min at 37C) with elemental sulfur (in colloidal suspension) causes a strong inactivation of rat liver serine dehydratase, except when dithioerythritol is present in excess (which prevents and reverses the inactivation). Reduced glutathione can replace, but acts much more slowly than, dithioerythritol as a protective agent, while mercaptoethanol is nearly as effective as dithioerythritol. The inactivation of serine dehydratase by sulfur is very similar in many ways to that obtained with p-chloromercuriphenylsulfonate. K+ ions at physiological concentrations effectively protect the enzyme against inactivation by both sulfur and the mercurial. Alcohol dehydrogenase and 3-hydroxybutyrate dehydrogenase, both sensitive to sulfhydryl reagents, can also be inactivated by elemental sulfur, and this inactivation is also counteracted by thiols. Elemental sulfur can behave as a sulfhydryl poison for a variety of enzymes.

5586 THE FUNCTION OF SUBCELLULAR FRACTIONS IN THE OXIDATION OF GLUTATHIONE IN RAT LIVER HOMOGENATE. *(E.)*

Jocelyn, P. C. (Dept. Biochem, U. Edinburgh, Scotland). *Biochem J* 117(5):951-956, 1970.

The role of subcellular fractions (homogenate, supernatant, microsomes and protein-free filtrate) in the oxidation of glutathione (measured by the method of Pinto and Bartley) was determined in rat liver homogenate. Aerobically, more gluthathione (GSH, μmole/ml) was oxidized in the homogenate (0.71) than in the supernatant (0.08) although if microsomes were added to the same supernatant or if it was preincubated with microsomes the oxidation increased (0.87 and 0.57 resp.). Anaerobically, more GSH was reduced in the supernatant (0.49) than in the homogenate (0.04) and microsomes (added to the supernatant during or before incubation) prevented this reduction. A protein-free filtrate (prepared from the supernatant) combined with the supernatant increased the GSH oxidation (0.52) although the reduction capacity of GSH was absent. The effect of the protein free filtrate was inhibited when a xanthine oxidase-free dialyzed supernatant was used and all the effective fractions had urate oxidase activity so that th GSH oxidation of the liver homogenate may be linked (through glutathione peroxidase) to the reaction of endogenous substrate with xanthine oxidase and of uric acid formed with peroxisomal urate oxidase.

5587 EFFECT OF LITHOCHOLIC ACID AND ANTIBIOTICS ON TISSUE BILE ACIDS IN THE RAT. *(E.)*

Nair, P.P. (Sinai Hosp., Baltimore, Md.), C. Garcia-Lilis and A.I. Mendeloff. *J Nutr* 100(6):698-704, 1970.

The changes in bile acid composition of the liver, bile and intestinal segments was measured in male Wistar rats (200-250 gm) maintained either on standard laboratory diet, on diet with exogenous lithocholic acid (50 mg/day/rat) with or without antibiotics (oxytetracycline, 50 mg/day/rat and succinylsulfathiazide, 20 mg/day/rat), or on diet with both antibiotics. The animals received the experimental diets for 8 days and on the 9th day free-flowing bile was collected for 30 min, then animals were sacrificed and tissues removed and analyzed for primary and secondary bile acid and cholesterol content. Exogenous lithocholic acid induced a specific depression of tissue cholic acid and elevated cholesterol levels. Cholic acid content in rat liver was reduced from a control value of 39.0 ± 8.8% to 24.1 ± 4.4%, in rat bile from a control value of 70.9 ± 1.5% to 29.2 ± 5.2%, in upper intestine from 80.8 ± 4.2% to 30.2 ± 3.1%, and in cecum from 18.3 ± 6.8% to 6.4 ± 1.3% by the dietary lithocholic acid. However the same test diet elevated serum cholesterol levels from a control value of 80.8 ± 7.8 mg/100 ml to 93.0 ± 5.9 mg/100 ml, and raised hepatic cholesterol content from 366 ± 33 mg/100 g to 428 ± 36 mg/100 gm of liver. The concurrent administration of antibiotics only partially prevented the effects of lithocholic acid on the primary and secondary bile acids in the tissues of the intestine, but in the liver the combined lithocholic acid-antibiotic diet reduced cholic acid concentration to 19.7 ± 2.2%, and reduced the hepatic cholesterol levels to 296 ± 23 mg/100 gm but kept the serum cholesterol at a nearly control level of 78.8 ± 2.9 mg/100 ml. Lithocholic acid partially blocked uptake of cholic acid all along the small intestine as reflected by the drop in total bile acids and a reduction in the ratio of cholic acid to chenodeoxycholic acid in animals receiving lithocholic acid. Lithocholic acid, and not its bacterial metabolites, seemingly controls cholic acid biogenesis possibly by inhibiting 12α-hydroxylase.

5588 THE FORMATION OF MONOACYLGLYCEROPHOSPHATE FROM *sn*-GLYCEROL 3-PHOSPHATE BY A RAT LIVER PARTICULATE PREPARATION. *(E.)* Lamb, R. G. (U. North Carolina Sch. Med., Chapel Hill) and H. J. Fallon. *J. Biol Chem* 245(12):3075-3083, 1970.

The product of the esterification reaction of *sn*-glycerol-3-phosphate by a rat liver particulate preparation (16000-105000 X g particles) was identified as monoacylglycerophosphate by thin layer and silicic acid column chromatography in comparison with known standards. An equimolar incorporation of fatty acid and *sn*-glycerol-3-phosphate into the product was shown and the monoacylglycerophosphate was isolated from the incubation mixture (silicic acid chromatography) and used as the substrate for further esterification (with guinea pig liver microsomes and palmitoyl-CoA at pH 7.5) to diacylglycerophosphate. A comparison of relative activities (μmoles formed/15 min) of acyl-CoA thioesters indicated that palmitoyl-CoA was the most active substrate (0.802) followed by linolenoyl-CoA (0.564), palmitoyl-CoA (0.475), oleoyl-CoA (0.422) and stearoyl-CoA (0.340). At pH 6.5, the 1-isomer of the monoacylglycerophosphate was preferentially formed when palmitoyl-CoA was the substrate while the 2-isomer predominates when oleoyl-CoA was the substrate (such specificity may explain the known positional distribution of fatty acids in the glycerolipids).

5589 HISTOCHEMICAL STUDIES OF THE ACTIVITY OF DEHYDROGENASES IN MITOSES DURING THE REGENERATION OF THE LIVER IN THE RAT. *(Fr.)* Dokov, V. K. (Lab. Anat. Histol., U. Liege, Belgium) and M. A. Gerebtzoff. *C R Soc Biol* 163(11):2461-2463, 1969.

Dehydrogenase activity in mitoses during hepatic regeneration following partial hepatectomy was determined histochemically in white rats 16, 18, 24, 30, 48, 66, 72 and 120 hr postoperatively. Maximum cell division was found between the 66th and 72nd hr. Succinate dehydrogenase, isozyme S of lactate dehydrogenase and glucose-6-phosphate dehydrogenase showed intense activity in the chromosomes of cells in all phases of mitosis. Glutamate dehydrogenase activity was only found in prophase. Dehydrogenase activity is seemingly involved in the degradation of glucose and glutamate dehydrogenase seems to be involved in preprophasic chromatin and chromosomes at all stages of somatic mitosis.

5590 HEPATIC MICROSOMAL ETHANOL-OXIDIZING SYSTEM: *IN VITRO* CHARACTERISTICS AND ADAPTIVE PROPERTIES *IN VIVO*. *(E.)* Lieber, C. S. (VA Hosp., Bronx, N. Y.) and L. M. DeCarli. *J Biol Chem* 245(10):2505-2512, 1970.

Characteristics of a hepatic microsomal ethanol-oxidizing system (distinguishable from the alcohol dehydrogenase system) in men and rats were determined in *in vitro* incubations. This system was located in the microsomal fraction, had a pH range of 6.8 to 7.4, required NADPH and oxygen and was inhibited by carbon monoxide. The activity of the system was only slightly lowered (5.2 compared to 11.1 U/mg protein) in male control rats after 3-amino-1,2,4-triazole (1 g/kg i.p.), was unaffected (47.6 compared to 49.1 nmoles/flask in control) after pyrazole (4.4 mmoles/kg intragastrically) and slightly lowered (49.1 to 31.0 nmoles/flask) after azide (10^{-4}M in the incubation mixture); these substances were effective catalase inhibitors so that catalase was probably not involved in this system. Chronic ethanol feeding of the rats for 24 days increased the NADPH-linked ethanol oxidation (248.1 to 368.2 U/g liver in males) and accelerated blood ethanol clearance (25.5 to 38.8 mg/100 ml) suggesting an *in vivo* role for the system which was further substantiated by the continued ethanol metabolism *in vivo* as well as *in vitro* following the pyrazole administration (which strongly inhibits alcohol dehydrogenase).

5591 BIPHASIC EFFECT OF NOREPINEPHRINE IN THE REGULATION OF HEPATIC TYROSINE TRANSAMINASE ACTIVITY. *(E.)* Black, I. B. (Natl. Inst. Mental Hlth., Bethesda, Md.) and J. Axelrod. *Arch Biochem Biophys* 138(2):614-619, 1970.

The biphasic effect or norepinephrine in the regulation of hepatic tyrosine transaminase activity (assayed by a modification of the method of Diamondstone) was observed in adrenalectomized and hypophysectomized rats. Norepinephrine (1 mg/kg s.c.) increased the enzyme activity for the first hr after injection then decreased it below control levels at 3 hr (in hypophysectomized animals as well indicating that the effect is not mediated by growth hormones). Over a range from 1 to 4 mg/kg s.c. norepinephrine increased the transaminase activity (μmoles product/g/hr) 50-70% above control values (67.6) during the first hr, and cycloheximide (50 mg/kg i.p.) given with norepinephrine (1 mg/kg s.c.) completely blocked this increase (77.8 for controls, 137.9 for norepinephrine and 69.8 for norepinephrine with cycloheximide) suggesting enzyme induction, while actinomycin D (1.5 mg/kg i.p.), propranalol or phenoxybenzamine (10 mg/kg i.p.) had no effect on the enzyme activity increase. The depression of enzyme activity 3 hr after norepinephrine injection was maximal at night when transaminase activity is at peak levels (184.1 depressed to 81.6) and no increase at 1 hr was observed when norepinephrine was given at night indicating that the enzyme depression operates independently of the induction. Norepinephrine administered with pyridoxine (100 mg/100 g i.p.) blocked the enzyme induction by pyridoxine hinting at a competition between norepinephrine and the apoenzyme for the pyridoxal-5'-phosphate cofactor.

5611 DIETARY REGULATION OF GLYCOLYTIC ENZYMES: VII. EFFECT OF DIET AND ORAL FOLATE UPON FOLATE-METABOLIZING ENZYMES IN RAT JEJUNUM. *(E.)* Stifel, F. B. (Fitzsimons Gen. Hosp., Denver, Colo.), R. H. Herman and N. S. Rosensweig. *Biochim Biophys Acta* 208(3):381-386, 1970.

The effects of diet, fasting and oral folate on the activities of 4 enzymes involved in rat (male Holtzman) jejunal folate metabolism were investigated by enzyme assay. All enzyme activities were expressed as increments in A^{355}nm which spectrophotometrically measures the amount of $N^{5,10}$-methenyltetrahydrofolate. Dietary carbohydrate (glucose and fructose) produced significant increases in the activities of 3 folate-metabolizing enzymes [glutamate formiminotransferase (.048 and .068, resp.), serine hydroxymethyltransferase (.324 and .381, resp.) and methylenetetrahydrofolate dehydrogenase (.729 and .820, resp.)] when compared with the activities in the casein-fed (.018, .273 and .552, resp.) or fasted (.007, .094 and .349, resp.) rats. Only the glutamate formiminotransferase activity showed a significant differential response ($P < 0.01$) to glucose and fructose, with the activity being highest in the fructose-fed rats. The formyltetrahydrofolate synthetase activity was highest in the casein-fed rats, less in the fasted rats and least in the carbohydrate-fed rats (.067, .057, .029, .030, resp.). A low p.o. dose (200 μg) of folate increased the activity of glutamate formiminotransferase (control: .063; treatment: .080), serine hydroxymethyltransferase (control: .187; treatment: .335) and methylenetetrahydrofolate dehydrogenase (control: .498; treatment: .601). However, only glutamate formiminotransferase activity showed an increased response (.131) to a high p.o. dose (2000 μg) of folate. Formyltetrahydrofolate synthetase activity was not significantly changed by either dose of oral folate. The adaptability of several folate-metabolizing enzymes to diet and oral folate may be examples of substrate stabilization and/or cofactor induction.

5612 CALCIUM AND PHOSPHORUS METABOLISM IN RELATION TO LACTOSE TOLERANCE. *(E.)* Condon, J. R. (St. George Hosp., London, England), J. R. Nassim, F. J. C. Millard, A. Hilbe and E. M. Stainthorpe. *Lancet* 1(7655):1027-1029, 1970.

The effect of lactose on calcium and phosphorus balance was studied in 4 patients with normal lactose tolerance (controls) and one patient with lactose intolerance. Administration of lactose to the 4 controls resulted in a decrease in fecal and urinary calcium with striking improvement in calcium balance. Urinary and fecal phosphorus levels decreased in 3 of 4 controls; phosphorus balance was improved in all controls. When lactose was ingested by the lactose-intolerant patient, fecal calcium increased, calcium balance became more negative, and fecal fat increased (6.1 g increase in a 24 hr period). Cessation of lactose ingestion caused a decrease in the frequency of bowel action, a decrease in the amount of fecal fat and calcium, and the calcium balance became less negative. The beneficial effect of lactose on intestinal calcium absorption seemingly is absent in patients with lactose deficiency. The administration of lactose may induce a negative calcium balance large enough to be a factor in eventual osteoporosis production.

5613 DIETARY REGULATION OF GLYCOLYTIC ENZYMES: VI. EFFECT OF DIETARY SUGARS AND ORAL FOLIC ACID ON HUMAN JEJUNAL PYRUVATE KINASE, PHOSPHOFRUCTOKINASE AND FRUCTOSEDIPHOSPHATASE

ACTIVITIES. *(E.)* Rosensweig, N.S. (St. Luke's Hosp. Ctr., New York, N.Y.), R.H. Herman and F.B. Stifel. *Biochim Biophys Acta* 208(3):373-380, 1970.

The effects of dietary sugars and p.o. folate on the activities of two glycolytic enzymes (phosphofructokinase and pyruvate kinase) and one gluconeogenetic enzyme (fructosediphosphatase) were studied in the human (2 normal male and 3 obese patients) jejunum by enzyme assay. The activities of pyruvate kinase and phosphofructokinase were higest on dietary fructose and decreased in order on glucose, carbohydrate-free and fasting regimens. Fructosediphosphatase activities were highest with fasting and decreased in order with carbohydrate-free, fructose, and glucose diets. The fructosediphosphatase to phosphofructokinase ratio (an estimate of the net direction of the glycolytic and gluconeogenetic pathways on the different diets) was highest with fasting and decreased in order on the carbohydrate-free, glucose and fructose diets. In contrast with the dietary sugars, p.o. folic acid produced a marked increase in the activities of all 3 enzymes. Apparently p.o. folic acid and dietary sugars can regulate the activities of human jejunal gluconeogenetic and glycolytic enzymes.

5614 EXTRACORPOREAL CIRCULATION IN THE INTESTINE OF THE DOG. EVIDENCE OF AN INTESTINAL SECRETION OF THE GLUCAGON TYPE. *(Fr.)* Grenier, J. F. (New Res. Inst., Copenhagen, Denmark), M. Gillet, J. Kachelhoffer, P. Wong, R. Arriaga, A. J. Moody, L. G. Heding, J. Markussen and F. Sundby. *C R Soc Biol* 163(11):2446-2449, 1969.

Intestinal secretion of a glucagon-like substance was studied radioimmunologically following perfusion of isolated dog intestinal segments with 2.7%, 15% and 30% glucose solutions. The introduction of the 2.7% glucose solution into the empty intestine increased the venous blood glucose to just below the arterial level; the 15% glucose solution produced a further glucose increase in the venous blood (superior to the arterial), but no further increase in blood glucose was seen with the introduction of the 30% solution. The pancreatic glucagon-like-immunoreactivity remained at a constant level of 0.6 ng Eq/ml. This result, in the absence of a glucose load, demonstrates the existence of an intestinal secretion of a glucagon-immunoreactive substance. The isolated intestine, under the conditions mentioned, seemingly is capable of absorbing glucose, and an increased concentration of glucose promotes an increase of the glucagon-like substance.

5615 THE HEMOPERFUSED ISOLATED SMALL-BOWEL SEGMENT: STUDY OF TEMPERATURE DEPENDENCE AND ACTIVATION ENERGIES OF MOTILITY AND ACTIVE AND PASSIVE ABSORPTION. *(Ger.)* Rinecker, H. (Surg. Clin. U. Munich, Germany), N. Mendler, C. Chaussy and W. Brendel. *Pfluger Arch* 317(1):35-55, 1970.

An improved method for the hemoperfusion (3 hr) of isolated intestinal segments was studied extracorporeally in dogs. Blood tests included: temperature, ionic determinations (Na^+, K^+), osmolarity, pH, pyruvate, lactate, glucose, hematocrit and total hemoglobin. A diminution of glucose (91.5 to 48.4 mg%) was not significant. Pyruvate (decrease) and lactate (increase) changes were ascribed to a liver-free circulation; the other determinations during the perfusion remained within the normal range, and after 3 hr, free serum hemoglobin was 56 mg/100 ml, oxygen utilization was 90% of initial value and vascular resistance (after increases due to hypothermia) was 84% of its initial value. Changes in motility accompanied temperature changes, and using the Arrhenius equation for the frequency/temperature ratio of contractions, a resultant activation of 15452 cal/mol was calculated. The water flux was reversed in hypothermia. Xylose absorption decreased (-33.9%) and the activation energy was 2765 cal/mol. Galactose absorption after perfusion also decreased (-25.3%) and its activation energy was 16164 cal/mol. The use of this method is recommended because of its high maintenance of functional properties.

5616 CONVERSION OF DIHYDROSPHINGOSINE TO PALMITALDEHYDE AND PALMITIC ACID WITH CELL-FREE PREPARATIONS OF GUINEA PIG INTESTINAL MUCOSA. *(E.)* Nilsson, A. (Chem. Ctr., U. Lund, Sweden). *Acta Chem Scand* 24(2):598-604, 1970.

Guinea pig intestinal mucosa was used to study the conversion of 4,5-$^3H_2$-dihydrosphingosine to palmitic acid by subcellular fractions. The activity of the homogenate was distributed largely between the low speed particle fraction obtained after centrifugatio at 22,300 g for 15 min (10.8 nmole palmitate/mg protein; 5.0 nmole palmitaldehyde/mg protein) and the microsomal fraction. The activity of the high speed supernatant was low (0.4 palmitate nmole/mg protein; 0.3 palmitaldehyde nmole/mg protein). The ratio of palmitate to palmitaldehyde formed varied with the protein concentration and with the time of incubation, but was consistently lower with the low speed supernatant than with the low speed particle fraction. All the radioactivity of the dimethylacetal fraction cochromatographed with the C-16 dimethylacetal carrier. The ester fraction contained radioactivity both as methyl palmitate and as a compound with a retention time of 0.79 relative to methyl palmitate. ATP, and Mg^{2+} or Ca^{2+} ions were needed for the reaction which was markedly stimulated by pyridoxal phosphate and in the presence of these compounds no effect of reducing or oxidizing cofactors was observed. Dihydrospingosine or an activated derivative in rat liver may undergo a vitamin B_6-catalyzed aldolase type cleavage to palmitaldehyde and ethanolamine or a derivative of ethanolamine.

5617 METABOLISM OF ORALLY ADMINISTERED ENZYMATIC PREPARATIONS: II. METABOLISM IN INTESTINE AND IN BLOOD STREAM. *(E.)* Nakagawa, S. (Nihon U. Sch. Med., Japan). *Nihon Univ J Med* 11 (1):53-63, 1970.

When rabbit small intestinal fluid was incubated with 0.1% lysozyme solution the lysozyme activity decreased 36.8% in 1 hr (control - 7.5%). When 30 ml of 0.1% lysozyme solution was injected into the duodenum of laparotomized rabbit, the lysozyme activity in the small intestine decreased to 16.3% in

15 min, possibly partly due to absorption or mainly due to destruction by the rabbit's own proteases. *In vivo* experiments showed the intestinal proteolytic activity in the rabbit to be elevated more than 300% after lysozyme was administered. The elevation of proteolytic activity was not observed after ∝-chymotrypsin was administered. One ml of rabbit serum diluted 1,000 times showed a buffering action to 1 mcg of ∝-chymotrypsin. When 100-200 mg lysozyme was injected into the right central ear vein of the rabbit the half-life of lysozyme in the rabbit blood stream was 5 hr and 50 min. Elevation of proteolytic activity in the serum is apparently not a good indicator for use in protease absorption studies.

5618 PHOSPHOENOLPYRUVATE-ACTIVATED PHOSPHORYLATION OF SUGARS BY INTESTINAL MUCOSA. *(E.)* Weiser, M. M. (Harvard Med. Sch., Boston, Mass.) and K. J. Isselbacher. *Biochem Biophys Acta* 208(3):349-359, 1970.

Evaluation of guinea pig and rat intestinal mucosa for presence of a soluble phosphoenolpyruvate-activated phosphotransferase system was made and its characteristics explored. After preparatory treatment, assay was done by high-voltage electrophoresis of the labeled N-acetylglucosamine phosphate substrate. Activity of the phosphoenolpyruvate-activated phosphotransferase was proportional to N-acetylglucosamine concentrations. In addition to acetylglucosamine, phosphoenolpyruvate-activated phosphorylation of galactosamine, glucose, glucosamine and fructose was also detected. An ATP-dependent phosphotransferase system of intestinal mucosa proved different from the phosphoenolpyruvate system because of its greater stability to heat (45° C.) and refractoriness to trypsin. The phosphoenolpyruvate system also phosphorylated fructose only to fructose-1-phosphate, whereas the ATP-dependent system generated fructose-6-phosphate and fructose 1,6-phosphate in addition. No evidence was obtained to link the phosphoenolpyruvate-activated system to intestinal sugar transport.

5619 DIETARY REGULATION OF GLYCOLYTIC ENZYMES: VIII. DOSE AND TIME RESPONSE OF RAT JEJUNAL ENZYMES TO ORAL SEX HORMONES. *(E.)* Stifel, F. B. (Fitzsimons Gen. Hosp., Denver, Colo.), R. H. Herman and N. S. Rosensweig. *Biochem Biophys Acta* 208(3):387-393, 1970.

The dose and time response to p.o. 17β-estradiol and testosterone on the activities (nmoles substrate metabolized/mg protein) of enzymes involved in carbohydrate metabolism (phosphofructokinase, pyruvate kinase, fructodiphosphatase and fructosediphosphate aldolase) were studied in the jejunum of normal female and male rats, resp. In male rats, p.o. testosterone increased pyruvate kinase (85.14) and phosphofructokinase (16.66) and decreased fructosediphosphatease (5.84) activities significantly from the control levels (56.28, 14.17 and 9.27, resp.) at concentrations of 5 µg with maximal effects (150.73, 32.04 and 3.33 resp.) at 50 µg. In female rats, p.o. estradiol increased pyruvate kinase (71.73) and decreased fructosediphosphatase (6.15) activities significantly from the control levels (51.13 and 9.40, resp.) at concentrations of 1 µg and increased phosphofructokinase (17.79) significantly from the control level (14.46) at a concentration of 5 µg with maximal effects on all 3 enzymes (143.33, 2.27 and 35.70, resp.) occurring at concentrations of 50 µg. Plots of the time responses to estradiol and testosterone in female and male rats, resp., were similar with slightly significant effects on all 3 enzymes occurring after 4 hr and the maximal effect occurring after 16 hr. The aldolase activity was unaffected by p.o. doses of the hormones.

5620 CHOLINE ACETYLTRANSFERASE ACTIVITY OF RABBIT ILEUM WALL: THE EFFECTS OF EXTRINSIC AND INTRINSIC DENERVATION AND OF COMBINED EXPERIMENTAL HYPERTROPHY. *(E.)* Filogamo, G. (Dept. Human Anat., U. Turin, Italy) and P. C. Marchisio. *Arch Int Physiol Biochem* 78(1):141-152, 1970.

The effects of direct denervation (freezing with N_2O), extrinsic denervation (technique of Filogamo and Muti), experimental stenosis (technique of Filogamo and Vigliani) and combined stenosis with extrinsic denervation on choline acetyltransferase activity were determined in rabbit ileum wall. After direct denervation, choline acetyltransferase activity (µmoles acetylcholine/g tissue/hr) was undetectable in the denervated segment although segments above and below showed activity (0.55 and 0.47, resp.) and protein concentration (mg/g tissue) was lower (118.7) than in the neighboring segments (138.5 and 146.0). After extrinsic denervation choline acetyltransferase activity was unchanged (0.41) from that observed in a control segment (0.44) taken 30 cm away although fluorescent fibers were absent suggesting degeneration of sympathetic postganglionic fibers supplying the ileum. Following experimental stenosis, choline acetyltransferase activity was not significantly altered (0.51 immediately above the constriction and 0.46 immediately below compared to the control value of 0.66) but when stenosis and extrinsic denervation were combined choline acetyltransferase activity was significantly lower above and below the constriction (0.24 and 0.43 resp.) compared to the control (0.62) and the specific activity was inversely proportional to the extent of hypertrophy.

5621 THE METABOLIC FATE OF LYSOLECITHIN ADMINISTERED INTO RAT DUODENAL LUMEN. *(E.)* Sato, Y. (Sapporo Med. Coll., Japan). *Tohoku J Exp Med* 100(3):277-287, 1970.

The metabolism of lysolecithin, labeled with (methyl-^{14}C)-choline or (2-^3H)-glycerol and injected intraduodenally into fasted female rats, was studied in isolated intestinal and liver preparations by chromatography and scintillation counting. Lecithin was the most radioactive of the phospholipids in the intestine (at 10 min after injection: lysolecithin, 34.6; sphingomyelin, 1.1; lecithin, 63.8; and cephalin, 0.3% of the total radioactivity and liver (at 90 min after injection: 7.0; 1.3; 91.6; and trace %, resp.). Lecithin was subfractionated into four molecular species according to the degree of unsaturation. There was no definite evidence for any difference in ^{14}C- and ^3H-specific activities between subfractions of intestinal lecithin. In liver lecithin, the ^{14}C-specific activity was much higher in monoenoic (3.5 cpm/µmole) and dienoic (4.3 cpm/µmole) than tetraenoic (1.1 cpm/µmole) and hexaenoic (1.5 cpm/µmole) subfractions. Appreciable amounts of ^{3}H-specific activity were incorporated into intestinal neutral lipids, with activity being highest in triglyceride, moderate in diglyceride, and negligible in monoglyceride (at 10 min after injection: 74.2; 15; 1.8%, resp., of the total radioactivity). The ^{14}C-specific activity was high in acid soluble fractions and three radioactive compounds were detected in liver and intestinal tissue. In the intestinal tissue at 10 min, the activity was highest in glyceryl-phosphorylcholine (71.8%), moderate in phosphoryl-choline (28.2%) and negligible in free choline but at 90 min, the three compounds showed almost identical activity (43.1, 32.6, 24.3%, resp). In the liver at 90 min, the radioactivity was highest in phosphoryl-choline (73.8%), moderate in choline (26.2%), and negligible in glyceryl-phosphorylcholine.

5622 EFFECT OF QUANTITATIVE UNDERNUTRITION ON THE ACTIVITIES OF INTESTINAL DISACCHARIDASES IN THE RAT. *(E.)* K. S. Henley (U. Michigan Med. Sch., Ann Arbor), O. M. Troglia and E. G. Laughrey. *Gastroenterology* 58(5):699-672, 1970.

5623 THE EFFECT OF S-(2-AMINOETHYL)-ISOTHIOURONIUM (AET) ON THE INTESTINE OF THE RABBIT, GUINEA PIG AND RAT. *(Ger.)* Schmid, A. (Vetr. Fac., U. Munich, Germany) and K. Gutschow. *Arzneimittelforschung* 20(4):511-513, 1970.

5624 CHARACTERIZATION OF PROTEOLYTIC ENZYMES SECRETED BY INTESTINAL GLANDULAR CELLS IN TWO *ANNELIDAE POLYCHETAE ERRANTES. (Fr.)* Michel, C. (Lab. Cytol., Paris, France). *Ann Histochim* 15(1): 19-24, 1970.

5625 THE APPEARANCE OF ENDOGENOUS FATTY ACIDS IN THE LUMEN OF THE MUCOSA OF THE SMALL INTESTINE IN THE RAT FOLLOWING THE INGESTION OF OLEIC ACID. *(Fr.)* Savary, P. (Fac. Sci., Marseilles, France) and M.J. Constantin. *Bull Soc Chim Biol* 52(1):89-103, 1970.

5626 RABBIT SMALL-BOWEL RESPONSE TO CELL-FREE FILTRATE OF CHOLERAIC FLUID. *(E.)* Schafer, D. E. (VA Hosp., Minneapolis, Minn.), D. Banerjee, U. Bhargava, S. SenGupta, B. Sircar and A. K. Thakur. *Proc Soc Exp Biol Med* 134(1):90-94, 1970.

GENERAL

5627 CYCLIC 3'5'-AMP, ITS DIBUTYRYL DERIVATIVE AND THEOPHYLLINE EFFECTS ON THE RAT PORTAL VEIN *IN VITRO. (E.)* Berti, F. (Inst. Pharmacol., U. Milan, Italy), C. Sitori and M. M. Usardi. *Arch Int Pharmacodyn* 184(2):328-333, 1970.

The effects of cyclic 3'5'-AMP, its dibutyryl derivative, and theophylline on the strength and frequency of contraction of 56 rat (male Sprague-Dawley) portal veins *in vitro* was studied by microdynamometry. 3'5'-AMP, dibutyryl-cyclic 3'5'-AMP, and theophylline (500 µg/ml, 250 µg/ml, 18 µg/ml, resp.) all cause a decrease in the force of individual contractions. 3'5'-AMP and theophylline also cause an increase in frequency. α- or β- blockade (phenoxybenzamine (0.3 µg/ml) and D-INPEA (7.0 µg/ml), resp.) do not modify responses elicited by 3'5'-AMP or theophylline. However, α-blockade with phenoxybenzamine, both at concentrations (10^{-5} M) antagonizing the spasm induced by 2 µg/ml of norepinephrine and in much lower concentrations (10^{-9} M), ineffective in this respect, potentiates the negative inotropic effects of dibutyryl-3'5'-AMP. Another α-blocking drug used, tolazoline, exerted a similar effect. The direct action ofdibutyryl-3'5'-AMP on the mechanical activity of the portal vein appears to mimic the stimulation of β-receptors, which is potentiated by α-blocking agents.

5628 CHANGES IN FAT AND CARBOHYDRATE METABOLISM FOLLOWING CHOLINOMIMETICS IN THE ANESTHE- TIZED RAT. *(Ger.)* Oelssner, W. (Med. Acad. Carl Gustav Carus, Dresden, Germany), A. H. Staib, H. D. Fischer, M. Hanefeld, D. Meissner and K. Westermann. *Arch Int Pharmacodyn* 183(2):209-214, 1970.

The effects of cholinomimetics (oxotremorine, carba- chol and methacholine; 0.25, 0.05 and 0.5 mg/kg, resp.) on fat and carbohydrate metabolism in anesthetized Wistar rats were studied. The content of glucose and lactic acid was increased by all 3 cholinomimetics, in all of the experimental animals. The free fatty acid content was increased only by oxotremorine. Atropine and methylatropine antagoniz the above metabolic reactions. The lipolytic effect of oxotremorine was not inhibited by the β-adrenergi blocking agent, KO 592.

29 RELATIONSHIP OF DECREASED SYSTEMIC AND
PORTAL BLOOD PRESSURE TO THE FLOW STOP IN
E SINUSOIDS OF THE LIVER. *(Ger.)* Pointner, H.
st Med. U. Clin., Vienna, Austria), L. Peschl,
d N. Stefenelli. *Z Ges Exp Med* 152(3):244-250,
70.

multaneous measurements of arterial (carotid) and
nous (portal) blood pressure are described in a
udy of changes in the microcirculation of the rat
ver during controlled blood withdrawal. In addi-
on, intravital microscopy was used to follow the
anges in the vessels by the insertion of cannula.
was possible to ascertain a blood flow arrest
ter the removal of approximately 30% of the total
ood volume. The animals had a mean value of 89.25
Hg arterial pressure and 92.3mm H_2O venous pres-
re, initially; at the time of flow arrest, the
terial pressure was 21.4mm Hg, and the venous
essure was 31.4mm H_2O. Upon blood withdrawal of
7 to 0.8 ml/min, a positive correlation was seen
tween the arterial and venous blood pressure de-
eases. The changes seen by means of intravital
croscopy in the rat liver at the time of flow
rest can be observed in all the liver sinusoids,
d no morphological changes were evident at that
me. Emphasis is directed at the slow withdrawal
blood to avoid cardiac or respiratory changes.

30 AUGMENTATION OF HEPATIC BLOOD FLOW BY
ACETYLCHOLINE. *(E.)* Wangensteen, S. I.
. Virginia Med. Ctr., Charlottesville), R. M.
dewig and J. J. Madden, Jr. *Amer J Surg*
9(5):510-514, 1970.

terations in blood flow, pressure and vascular
sistance due to infusion of Acetylcholine (ACh)
to the hepatic artery, portal vein and jugular
in are reported. Electromagnetic flow probes
d pneumatic occluders were applied to the hepatic
tery and hepatic vein of 16 dogs (15-20 kg), lightly
esthetized with sodium pentobarbital through a mid-
ne incision. Two small catheters were passed from
om the splenic vein into the portal vein for blood
mpling, pressure measurements and ACh infusion.
patic venous pressure and inferior caval pressure
re also measured by means of inserted catheters.
en stabilization of hemodynamic parameters was
complished, ACh was administered (0.125 mg/0.1 ml/min)
r one hour by infusion pump. Hepatic arterial flow
se from a control value of 254 ml/min to 442/ml min
verage) after 10 minutes of ACh infusion and stabi-
zed at this level. Total hepatic flow rose from
e control value (532 ml/min) to 651 ml/min, while
changes in cardiac output, blood pressure or
art rate were noted. Portal venous pressure rose
om 5.3 mm Hg to 7.4 mm Hg during the infusion,
ile resistance fell in the hepatic artery from
45 units of peripheral resistance (PRU) to 0.25 PRU
ring ACh administration as portal venous resistance
se from 0.019 to 0.042 PRU. Isotonic saline per-
sion verified that the noted changes were caused
ACh. Systemic infusion of ACh into the jugular
in caused an increase in hepatic arterial flow (26%)
a 31% depression of hepatic arterial resistance
th parallel systemic changes in these parameters
so noted. The value of ACh for patients needing
creased hepatic arterial flow is discussed.

5631 THE EFFECT OF ORAL TETRACYCLINE HCl AND DOXYCYCLINE ON THE INTESTINAL FLORA. *(E.)* Hinton, N.A. (Dept. Microbiol., Queen's U., Kingston, Ontario, Canada). *Curr Ther Res* 12(6):341-352, 1970.

The relative effects of orally administered tetracycline HCl and doxycycline on alteration of the intestinal flora were studied in 68 normal, healthy subjects who had taken no antibiotics for at least 3 months. The subjects were randomly allocated to four groups of 17, and each subject submitted one stool sample each week for 3 weeks for a baseline estimate of pretreatment stool flora. One group received tetracycline HCl (1 gm/day in 4 doses for 8 days) and was compared with a group receiving doxycycline in standard therapeutic doses (200 mg on day 1, and 100 mg/day thereafter). Two additional groups received doxycycline at doses of 200 mg/day in 2 doses, or 400 mg/day in 2 doses. Stool samples were collected on day 2, 4, 6 and 8 from all subjects during treatment, and posttreatment stools were collected at 4, 5 and 6 weeks. During the 8-day treatment with tetracycline HCl total positive cultures of *Candida* species (count over 10^2) increased from a baseline level of 23.5% to a treatment level of 55.9% and remained elevated 4 to 6 weeks after treatment at a level of 35.2%; fecal streptococci cultures (count $> 10^6$) increased from pretreatment levels of 11.7% to 70.5% and were still elevated to 23.5% after 6 weeks; *Proteus, Pseudomonas and Klebsiella* cultures (count $> 10^5$) increased from 16.6% to 64.3% during treatment, and posttreatment levels remained at 60.8%. During tetracycline therapy, however, *Escherichia coli* cultures declined from pretreatment culture counts ($> 10^6$) of 78.4% to 55.9%, and remained slightly depressed posttreatment at 74.5%. Doxycycline in a standard therapeutic dose of 100 mg/day produced no significant observable population effect on the intestinal flora. Doxycycline at a dose of 400 mg/day was associated with a series of increases in content of intestinal flora which were indistinguishable from those produced by tetracycline HCl. Doxycycline at a dose of 200 mg/day produced similar measurable, but less dramatic effects. During the study, tetracycline therapy in 17 subjects produced one incidence each of nausea or anorexia, diarrhea and constipation. Doxycycline at a dose of 100 mg/day produced only 1 incidence of constipation. However, doxycycline at a dose of 400 mg/day produced 10 reports of nausea or anorexia and 11 cases of constipation.

5632 EFFECTS OF HEPATIC VENOUS PRESSURE ON TRANSSINUSOIDAL FLUID TRANSFER IN THE LIVER OF THE ANESTHETIZED CAT. *(E.)* Greenway, C. V. (Fac. Med. U. Manitoba, Winnipeg, Canada) and W. W. Lautt. *Circ Res* 26(6):697-703, 1970.

The relation of hepatic venous pressure and volumes to ascites formation and hepatic cirrhosis was investigated in anesthetized cats (30 mg/kg pentobarbital). The liver was placed into a sealed plethysmograph with the portal vein and hepatic artery left intact. Hepatic flow was drained by cannula into the thoracic vena cava with the abdominal cava occluded below the entrance of the hepatic veins, while the lower inferior caval blood drained into the femoral veins. Blood passed to a reservoir and returned through jugular venous cannulas. Arterial pressure, portal pressure, hepatic flow and volume were simultaneously recorded. While varying hepatic venous pressure from 2.3 to 11.7 mm Hg for periods between 20 minutes and 5 hours, arterial pressure showed little change (although portal pressure increased and stabilized at a new level after an initial rapid rise) while hepatic volume increased rapidly at first, followed by a slower rise. Measurement of total blood volume using ^{51}Cr-tagged red blood cells revealed an increase which was caused by an increased hepatic blood volume and a fluid filtration which occurred during the period of raised venous pressure. Results indicate that hepatic transsinusoidal fluid filtration appear to be dependent on sinusoidal hydrostatic pressure and that no available protective mechanisms prevent filtration during raised hepatic venous pressure.

DIAGNOSTIC PROCEDURES

646 TRIPLE BIOLOGICAL TEST FOR THE DIAGNOSIS
OF HEPATIC DISORDERS: ASSOCIATED INVESTI-
ATION OF PROTHROMBIN, FIBRINOLYTIC AND COMPLEMENT
CTIVITIES. *(Fr.)* Titeica, M. (Inst. Med. Pharm.,
ucarest, Rumania) and D. Radulesco. *Arch Roum Path
xp Microbiol* 28(2-3):277-283, 1969.

triple biological test (prothrombin, fibrinolysis
nd complement activities in the serum) was described
or the detection of certain hepatic disorders in 16
atients (9 cirrhosis, 2 cirrhosis with adenocarci-
oma, 5 primary cancer of the liver). Patients with
irrhosis with hepatic insufficiency showed low re-
ults (prothrombin time coagulation < 100%; euglobu-
in lysis < 90-120 min; complement titration < 120
H_{50}/ml) in all 3 tests; in primary hepatic cancers,
alues were maximally increased; in less acute cir-
nosis (splenomegaly, without biochemical abnormali-
ies) decreased fibrinolysis and prothrombin and
ormal complement activation were found. In cirrhosis
ith adenocarcinoma, fibrinolysis was increased with
decrease in the other 2 tests. A decrease in all 3
alues appears to indicate hepatic malfunction; an
cceleration of fibrinolysis indicates cirrhosis. All
activities are increased in hepatic cancer.

547 LIVER AND BLOOD GLYCOPROTEINS. *(Ger.)*
Kerschbaumer, F. W. (Konig Sanit., Bad
ergentheim, Germany). *Wien Klin Wschr* 82(18):
33-337, 1970.

lycoprotein determinations (2000) were performed in
40 patients with various hepatic disorders (chronic
epatitis, unspecific reactive hepatitis, steatosis)
o investigate its value for differential diagnosis.
n chronic hepatitis, the mucoproteins were normal
75.0 ± 10.0 mg%) or slightly increased (thus dif-
ering from the low values in liver cirrhosis); in
teatosis, mucoproteins were high (100-154 mg%).
nspecific reactive hepatitis may be evaluated more
efinitely by the mucoprotein content so as to delimit
ne participation of other diseases such as intestinal
r polyarthritic involvement.

48 USE OF RESPIRATORY HYDROGEN (H_2) EXCRETION
TO DETECT CARBOHYDRATE MALABSORPTION. *(E.)*
evitt, M. D. (U. Minnesota Hosp., Minneapolis) and
M. Donaldson. *J Lab Clin Med* 75(6):937-945, 1970.

ne use of respiratory hydrogen as an indicator of
rbohydrate malabsorption was evaluated in 36
ealthy young adults, 15 hospitalized patients with
history of gastrointestinal diseases, and 4 pa-
ents with intermittant diarrhea following subtotal
strectomy. Basal fasting level of H_2 excretion in
rmal subjects averaged 0.10 ± 0.07 ml (1 S.S.) per
n. H_2 excretion increased slightly in each of 19
bjects studied 24 hours after ingestion of 25 g of
lose (an incompletely absorbed sugar), but never
creased above basal level in 24 healthy subjects
o ingested 100 g of glucose (a completely absorbed
gar). In order to prove that H_2 excretion failed
increase in healthy subjects given glucose be-
use of complete glucose absorption rather than
ability of colonic flora to ferment glucose, fecal
ecimens from 5 subjects with and without glucose were incubated. The addition of glucose to fecal samples from all subjects markedly increased H_2 production (mean without glucose, 0.007 ml/hr; mean with glucose, 0.32 ml/hr). Assessment of lactose absorption with the use of breath H_2 measurements agreed closely with the results of standard lactose tolerance tests. The advantages of the breath H_2 excretion technique over the tolerance test is that it reflects the quantity of sugar not absorbed (is not influenced by gastric emptying rate of intermediary glucose metabolism) and it is sensitive enough to detect malabsorption of as little as 5 to 10 g of carbohydrate.

5649 THE ESOPHAGUS IN PROGRESSIVE SYSTEMIC SCLEROSIS: A MANOMETRIC AND RADIOGRAPHIC CORRELATION. *(E.)* Parker, J. (Montefiore Hosp. Med. Ctr., New York, N. Y.), M. Neschis, S. S. Siegelman and J. Rotstein. *Amer J Dig Dis* 15(5):443-447, 1970.

The sensitivity of the barium esophagogram or esophageal manometry as a technique in determining the extent of esophagela involvement in progressive systemic sclerosis was determined. Barium esophagrams with fluoroscopy and manometric evaluation using polyvinyl catheters attached to Sanborn pressure transducers were performed on 27 patients. Following analysis of the esophagrams, patients were grouped into 3 classes: those with normal peristaltic activity, those with abnormal peristalsis with hiatal hernia and slight dilatation and those with no peristaltic activity, hiatal hernia and moderate dilatation. The patients were further divided into 4 groups based on the motility results: those with normal inferior esophageal sphincter and normal peristaltic activity, those with decreased pressure in the inferior esophageal sphincter and normal activity in the distal body of the esophagus, those with decreased pressure in the inferior esophageal sphincter and aperistaltic waves in the distal body of the esophagus and those with absent inferior esophageal sphinctor and no distal body of the esophagus activity. Manometry was concluded to be a more sensitive method for determination of the degree and presence of esophageal involvement in systemic sclerosis.

5650 TOLUIDINE BLU-O AND ITS ANALOGS AS PARATHYROID AND PANCREATIC SCANNING AGENTS: TISSUE DISTRIBUTION OF TOLUIDINE BLUE-O AND EVALUATION OF ITS ANALOGS. *(E.)* Mortenson, R. A. (Duke U. Med. Ctr., Durham, N. C.) and J. McRae. *Arch Surg* 100(6):710-713, 1970.

Feasibility of toluidine blue-O (dimethyltoluthionine) and its gamma-emitting analogs as parathyroid and pancreatic scanning agents was studied in 50 female dogs (40 dogs received dye, i.v., in 5 minutes; 5 dogs received dye, i.v., over 1 hour, 5 dogs received dye via transduodenal injection). After injection, most dogs were observed to have a distinct bluish coloration of pancreas and parathyroids. Animals receiving rapid injections developed trachypnea, bradycardia, and agitation during the blush phase, and as infusion continued the EKG changed (e.g. lengthening of PR-interval, increased P-wave amplitude, I-wave inversion, and occasional ventricular extrasystoles. These changes reverted to normal at 10 minutes after infusion). Although the pancreas showed a five fold preferential uptake of toluidine blue-O due over the liver, massive size and proximity of liver mask the effect of the concentration diffenential. Toluidine Blue-O dye, in this case offered no advantage over current pancreatic screening with ^{75}Se-selenomethionine, which is concentrated 6 to 8 times that of the liver. In dogs receiving dye over a 1 hour period, excretion rates and distribution of dye was similar to those of the rapidly injected group, but the total amount of dye in tissue and fluid was less, and no adverse EKG changes were noted. In the group of dogs receiving intraduodenal dye injections, urine and bile appeared blue to the naked eye within 30 minutes. The percent of initial dose of dye that was cleared in urine was one sixth that cleared after i.v. injection, and the percent cleared via biliary system was one tenth that cleared after i.v. injection. Trace amounts of dye were found in the liver in a group of dogs, after a 24-hour period; no dye was found after 48 hours. The use of γ-emitting analogs of toluidine blue-O apparently offers no clear-cut advantage over present scanning techniques for pancreas visualization. However, fluorine-labeled analogs of the toluidine blue-O molecule seemingly are well suited to scanning normal parathyroid tissue especially parathyroid adenomas where dye is preferentially picked up. use of γ-emitting analogs of toluidine blue-O apparently offers no clear-cut advantage over present scanning techniques for pancreas visualization. However, fluorine-labeled analogs of the toluidine blue-O molecule seemingly are well suited to scanning normal parathyroid tissue especially parathyroid adenomas where dye is preferentially picked up.

5651 A COLLABORATIVE STUDY FOR THE EVALUATION OF A SEROLOGICAL TEST FOR PRIMARY LIVER CANCER.

(E.) O'Conor, G. T. (Natl. Cancer Inst., Bethesda, Md.), Yu. S. Tatarinov, G. I. Abelev and J. Uriel. *Cancer* 25(5):1091-1098, 1970.

The specificity and sensitivity of the alpha-fetoprotein test with respect to human primary liver cancer was the object of a collaborative study in which sera collected from 813 patients at 5 different African centers and 2 non-African centers were examined by 3 test centers for the presence of alpha-fetoprotein. Of the 813 patients, 247 had a clinical and/or histologic diagnosis of primary liver cancer, and the other 566 were used as controls. Alpha-fetoprotein was found to be present in 163 patients and absent in 623 patients. In 27 cases (3.3%) there was disagreement in the results between the 3 test centers. In 12 controls, a positive serological test was reported and they were listed as false-positives. Of the 231 cases of primary liver cancer, a positive serological test was recorded in 65.4% with a range among the 7 collection centers between 46.4% to 75%. If only those cases with histologic confirmation of liver cell cancer were included, the percentage of cases with alpha-fetoprotein increases to 75%. In the 12 false-positive cases, there were 2 cases of teratocarcinoma of the testicle and the remaining 10 cases included stomach carcinoma, pancreatic carcinoma, metastatic carcinoma with underlying cirrhosis in 2 cases, and other disorders based on clinical diagnosis alone.

5652 EXPERIENCES WITH DATA PROCESSING TO SEPARATE THE IMAGES IN PANCREATIC SCANNING.

(E.) Charlesworth, D. (Manchester Roy. Infirm., England), H. J. Testa, B. R. Pullan and H. B. Torrance. *Gut* 11(3)261-267, 1970.

A dual isotope technique with computer separation of pancreatic image from combined liver and pancrea scan was investigated *in vitro* and *in vivo*. With a ratio subtract system, the results were displayed either as a photodot recording or numerically. ^{99m}Technetium labeled sulfur colloid (a liver-seeking isotope) was used in combination with ^{75}Se methionine allowed a normal selenium liver and pancreas scan to be recorded simultaneously, without interference from liver seeking isotope. *In vitro* experiments with a phantom liver and pancreas (cadaver) successfully erased the liver image from the final printout. Complete separation of pancreas from overlying liver was achieved in 2/8 subjects. Changing of normalizing factor in each case did not improve the image. In a third experiment, the scan ratio of ^{99m}Tc to ^{75}Se did change with time (statistically significant). The computer was programmed to produce a density map showing all points with a probability above 2 standard deviations. Observer scan interpretation is a process of pattern recognition. The observer, therefore, unconsciously superimposes a preconceived pancreati image on the scan, fitting dots of equal density into this pattern. Variations are thus detected not fitting one of acceptable normal patterns. The dual isotope technique, at present seemingly offers no advantage over the photodot recording.

5653 INTRAGASTRIC pH MEASUREMENTS. *(Ger.)*

Rosenbaum, K. D. (Surg. Klin. Ernst Morit Arndt U. Greifswald, Germany), E. Wolf, J. Peterma and R. Templin. *Zbl Chir* 95(5):153-157, 1970.

Gastric juice acidity (100 samples) was measured b a method utilizing a radio-transmitter (which can swallowed) and a glass electrode chain (thereby avoiding the irritation associated with a gastric tube). The effect of intubation was evaluated by continual aspiration after histamine stimulation u the pH reached its initial level. No apparent eff on pH due to intubation is seen in gastric hyperac ity (pH differences 0.5-1); the intubation effect also not present in anacidity, even with histamine stimulation, when this does not promote acidity. histamine stimulation increases acidity, an effect intubation is seen (increased pH-difference of 4). transmitter-glass electrode combination may be of ue in the determination of stimulated gastric juic and can be used to advantage in serial determinati

54 BRUSHING CYTOLOGY OF THE ESOPHAGUS AND STOMACH UNDER DIRECT VISION BY FIBERSCOPES.

) Kobayashi, S. (Pritzker Sch. Med., U. Chicago, l.), J. C. Prolla and J. B. Kirsner. *Acta Cytol* (4):219-223, 1970.

ushing cytology of esophageal and gastric lesions ler direct vision of fiberoptic endoscopes was vestigated in 108 patients (21 with cancer and 87 h other non-cancerous processes). Diagnostic uracy was 95.2% in cancer cases, while false itive diagnosis was 3.4% in non-cancer group. cases of early gastric carcinoma confined to osa or submucosa were correctly detected by this hnique. A false positive cytology was observed a case of Borrmann type IV carcinoma, in which cer was present mainly in submucosa. Three false itive cases were reported, two in benign gastric ers and one in recurrent esophagitis near the dioesophageal junction, where misrepresentation been based upon numerous mitoses and pronounced lear irregularities. Repeat or follow-up studies e stressed in order to emphasize the role of ative cytology on repeat examination. Follow-up roach in combination with direct vision biopsy indispensible in the detection of malignant tro-esophageal lesions in early stages of mucosal submucosal invasion. Acridine orange method of l staining was suggested as the method of choice screening of large mass surveys, due to its high itive rate and rather low false positive index of picion.

5 STUDIES ON THE INSULIN TEST FOR COMPLETENESS OF VAGOTOMY.

(E.) Welbourn, R. B. y. Postgrad. Med. Sch., London, England), J. H. n, J. Spencer, G. P. Burns, F. C. Y. Cheng and . Cox. *Bull Soc Int Chir* 29(1):1-6, 1970.

gastric acid secretory response to insulin, sex erences in response to insulin, and completeness agotomy as tested by the Hollander method were lied in 353 patients. In 20 experiments performed healthy, eupeptic 37-yr-old man, there were ificant correlations between the i.v. dosage of lin (0.03 to 0.4 units/kg) and the fall in blood ose and gastric secretory response (peak acid ut). Of 138 men and 44 women who underwent vamy, 38% (53) and 18% (8), resp., had positive onses to standard Hollander insulin tests, cating incompleteness of surgery. Gastric juice ut and acid concentration indicated no sex erence in the rate of incomplete nerve section. sitive response to the Hollander insulin test obtained within 45 minutes in 51 of 81 men and 19 women with duodenal ulcer, indicating no sex erence.

5 TUBELESS GASTRIC ANALYSIS WITH A RADIO-TELEMETERING PILL (HEIDELBERG CAPSULE).

Bingham, J. R. (Dept. Med., U. Toronto, Ontario, da) and M. R. Andres, Jr. *Canad Med Ass J* 102 :1087-1089, 1970.

method for measuring gastric acid secretion with diotelemetering pill, the Heidelberg pH capsule, was described and results were compared with those obtained by the standard aspiration test of Kay using Histalog as the stimulus. With the Heidelberg pH capsule (containing a miniaturized radio transmitter, a pH meter, and a battery enclosed in an indigestible acrylic container measuring 20 X 7 mm), the titration was done inside the stomach while the pH was being continuously monitored. The number of ml of neutralizing alkali (given in 20 ml of water) required to neutralize the gastric secretion equaled the amount of acid secreted in milliequivalents and comparison of the acid values obtained by the capsule and the aspiration methods in 27 patients (7 with duodenal ulcer, 5 with dyspepsia, 3 with gastric ulcer, 1 with treated duodenal ulcer, 11 with no disease) showed acceptable agreement with a correlation coefficient of 0.68. There was no statistical difference between the 2 mean acid secretions (30 mEq, 27 mEq) determined by the capsule method and aspiration method, resp. The capsule method was simpler to do and caused only minimal discomfort.

5657 PERCUTANEOUS LIVER BIOPSY WITH A FLAT, SHARPENED MENGHINI-NEEDLE.

(Ger.) Muller, H. O. (no affil.), E. Gundel and H. Kollmeier. *Deutsch Med Wschr* 95(23):1259-1260, 1970.

Comparative findings in 100 patients are reported on the methods of obtaining liver biopsies, either by the conventional percutaneous aspiration needle, or with a modified flat sharpened Menghini needle, the traditional angle of the shaft being at 45°, and the modified form at a 25° angle. The needles used were all of a 1.6 mm diameter and a length of 70 or 160 mm (approx.) according to the patient's anatomical structure. Of the 100 conventional punctures, 83 successful biopsies were obtained; whereas with the modified method, 96 successful biopsies were obtained, and no complications followed using either of these methods. The gain in length of the cylinder in the modified form was 1.92 cm against a 1.61 cm of the conventional type (significantly different), but no increase in the size of the particles resulted from this difference. Some results of liver biopsies, which were seen to leave a mark on the parietal peritoneum, when examined during laparoscopy are described, and attributed to the type of needle used previously.

5658 DETERMINATION OF THE VIABILITY OF ISCHEMIC INTESTINE.

(E.) Myers, M. B. (Touro Res. Inst., New Orleans, La.), K. Carter, Jr., M. Halle and G. Cherry. *Arch Surg* 100(6):695-701, 1970.

Twenty-nine canine ileum preparations were subjected to various periods of total avascularity, and serial tests with a dye (3-(4,5-dimethylthiazol-2-yl)-2,5-diphenyl-2-H-tetrazoluim bromide) were performed to investigate a possible correlation between dye times and animal survival. With the exception of one dog (avascular time) whose avascular bowel showed a dye time of 78 sec and survived, all dogs with a time of over 70 sec died with gangrene of that portion of the bowel. Two dogs whose bowel was avascular for 10 hr had times of only 45 and 50 sec and both of these survived. The dye times 30 to 45 min after the revascularization of the bowel (devascularized for 10 hr) in 2 dogs were 45 and 50 sec (both survived) and in the others 100 and 108 sec (both died). The main difficulty with the test is the subjectiveness of the end point, i.e. the color change of the tetrazolium dye from yellow to blue when it is reduced by dehydrogenase enzymes.

5659 SIGNIFICANCE OF PERITONEOSCOPY IN THE PRESENCE OF HEPATIC SPACE-OCCUPYING LESIONS BY LIVER SCAN.

(E.) Villa, F. (Hektoen Inst. Med. Res., Chicago, Ill.), J. Elizondo, H. H. Byun and F. Steigmann. *Amer J Gastroent* 53(5):474-477, 1970.

Thirty-six patients were examined by peritoneoscopy and by liver scan for differential diagnosis of liver disease and to determine the presence and extent of space-occupying lesions. Liver scan revealed single lesions in 13 patients and multiple space-occupying lesions in 23 patients. Of the 13 patients with single hepatic lesions, 7 patients had malignant tumors as a cause of the defect on the liver scan; in the remaining patients the defect was caused by liver abscess in 2 cases, and by extrinsic compression (from ascites, pancreatic cyst or enlarged gallbladder) in 6 cases. Of the 23 patients with multiple lesions, liver scanning revealed 16 cases of malignant tumor, and in 7 patients the scan defect was due to postnecrotic cirrhosis, polycystic liver, sarcoid-alcoholic hepatitis, fatty liver or hemiangiosarcoma. Because extrahepatic factors cause defects on the liver scintigram, the definitive diagnosis can be made only by peritoneoscopy. The hepatic lesion must be at least 2 cm in size to be seen on the liver scan. Peritoneoscopy will detect surface lesions on the liver, but is ineffective for the diagnosis of deep lesions.

5660 EARLY DIAGNOSIS OF FATAL HEPATITIS.

(E.) Colombi, A. (Dist. Hosp. Basel, Switzerland). *Digestion* 3(3):129-145, 1970.

Differential clinical and laboratory data of 97 patients (32 comatose and 60 non-comatose) were analyzed relative to their value for early diagnosis of severe hepatitis with impending hepatic coma. Serum values of transaminases, bilirubin, lactic acid, ammonia and albumin did not prove reliable for early diagnosis of hepatitis in non-comatose patients. Liver biopsy information proved reliable to indicate degree of hepatocellular damage, but could not be repeated daily to monitor disease development. In contrast, blood clotting factors proved a reliable and quantitative parameter of hepatocellular damage when compared to liver biopsy and state of consciousness. In mild hepatitis prothrombin values (Quick) were always above 65%, and above 45% in medium groups (1 exception). Non-comatose patients with severe hepatitis had Quick values between 60% and 20%; Quick values in all patients with endogenous hepatic coma were lower than 30%. There was no difference between the survival and the fatal group. In 37 patients with mild or medium hepatitis, the fibrinogen mean value was 288 mg%. Nine patients with severe hepatitis (but without coma) had a mean fibrinogen level of 165 mg% (range 90 to 250 mg%). The comatose group had a mean value of 139 mg% (range 56 to 225 mg%). The index was higher than 220 for patients with mild hepatitis, higher than 160 for the medium hepatitis group, and between 74 and 160 for the non-comatose group with severe histologic damage. All patients with endogenous hepatic coma had a II, V, VII-index lower than 75. Furthermore, signs of secondary aldosteronism were present in 74% of comatose patients and hypoglycemia was observed in 3 patients with endogenous hepatic coma.

5661 MEASUREMENT OF PROTHROMBIN: A NEGLECTED LIVER FUNCTION TEST IN INFANCY AND CHILDHOOD.

(E.) Glueck, H. I. (U. Cincinnati Coll. Med. Ohio), R. M. Will, A. J. McAdams and G. Gleser. *J Pediat* 76(6):914-922, 1970.

Biopsy or surgical specimens obtained from 42 infan and children hospitalized for jaundice and receivin parenteral vitamin K to exclude hypoprothrombinemia due to vitamin deficiency were used for one-stage prothrombin and *p*-toluenesulfonyl L-arginine methyl ester prothrombin assays. The pathologist established the diagnosis, estimated the degree of paren chymal damage, and classified the impairment of function into 4 categories, ranging from none to severe. Moderate to severe cellular damage was found in 14 patients and the diagnosis was hepatiti in 11 of the 14. A high degree of correlation was found between the pathologist's estimate of parenchymal damage and the one-stage prothrombin assay, and also for the *p*-toluenesulfonyl L-arginine methy ester assay. In 3 cases, prothrombin time was prolonged in which the pathologist could find no evidence of liver damage. In 2 cases esterase prothro bin was depressed when the biopsy was considered normal. In 2 cases a normal *p*-toluenesulfonyl L-arginine methyl ester assay was associated with moderate liver damage. When plasma samples were assayed simultaneously by the 2 procedures, a high degree of correlation was observed. Abnormal prothrombin values were more common in cases of hepat tis. Assays were usually normal early with atresi or with infiltrative liver disease. The *p*-toluenesulfonyl L-arginine methyl ester assay proved usef when the one-stage method was questionable or mode ately abnormal. Since the assays could not differ entiate jaundice caused by obstruction from that found with minimal hepatitis or infiltrative liver disease, it is suggested that their use should not preclude biopsy and/or early exploration in the infant.

GASTROINTESTINAL DISEASES

ESOPHAGUS

5732 AN ISOPERISTALTIC GASTRIC TUBE: NEW METHOD OF ESOPHAGEAL REPLACEMENT. *(E.)*
amagishi, M. (Yokohama U. Sch. Med., Japan), N.
keda and T. Yonemoto. *Arch Surg* 100(6):689-692,
970.

new method of esophageal replacement or bypass,
sing an isoperistaltic gastric tube isolated from
he greater curvature side of the stomach, is de-
cribed. The tube can be moved a considerable dis-
ance and its oral end can be anastomosed to the
ervical esophagus without tension even if a sub-
utaneous route is chosen. This positioning is
ossible because the tube has a long vascular pedi-
le made from the right gastroepiploic vessels.
eventeen patients with esophageal cancer involving
he middle or upper-third of the esophagus and
reated with the new bypass procedure revealed no
perative deaths; radical resection of cancer was
erformed in 2 patients. Postoperative complica-
ions occurred in 50% of the patients. Leakage in
he neck occurred in 2 patients; none of the pa-
ients complained of regurgitation of gastric juice.
he isoperistaltic gastric tube seemingly is one of
he most satisfactory structures for an esophageal
ubstitute and is safely applicable to various kinds
f esophageal surgery.

733 PREVENTION OF GASTROESOPHAGEAL REFLUX AFTER RESECTION OF THE LOWER ESOPHAGUS.
.) Bombeck, C. T. (Abraham Lincoln Sch. Med.,
icago, Ill.), R. G. P. Coelho and L. M. Nyhus.
rg Gynec Obstet 130(6):1035-1043, 1970.

mple esophagogastric anastomosis techniques, for
e prevention of gastroesophageal reflux were eval-
ted in the experimental adult mongrel dogs after
wer esophageal resection. Of the 7 dogs subjected
resection with esophagogastrostomy, the 5 survi-
rs developed free reflux, and were later submitted
reoperation and gastric fundoplication around
ophagogastric anastomosis in the chest. Two ani-
ls survived, and there was an abrupt change in the
level from 1.5 intragastric to 5.6 in the thoracic
ophagus. There was no high pressure zone caused by
ndoplication. Both dogs demonstrated complete
earing of esophagitis on esophagoscopy and absence
reflux. Neither dog could be made to reflux with
vere abdominal compression while in the Trendelen-
rg position. Five of the dogs were submitted to
multaneous esophagogastrectomy and fundoplication;
ne demonstrated gastroesophageal reflux. One of 5
gs was made to reflux when severe abdominal
essure was applied, while it was in the Trendelen-
rg position; normal dogs refluxed with this proce-
re. In 1 dog the lower esophagus was resected
ecause of esophageal stricture) and gastrointesti-
l continuity was re-established by esophagogastric
astomosis (fundoplication was performed around
astomosis); recovery was complete and uneventful.
e method described does not produce a new sphincter
the lower esophagus, but is actually a simple
chanical valve which allows the free passage and
stricted flow of materials in a prograde direction.

5734 ESOPHAGEAL RECONSTRUCTION USING A GASTRIC TUBE: A PRELIMINARY REPORT. *(E.)* Cohen, D. (Roy. Alexandria Hosp. Child., Sydney, Australia). *Aust Pediat J* 6(1):22-24, 1970.

Three children with esophageal atresia (previously treated by cervical esophagostomy and gastrostomy) were subjected to esophageal reconstruction using a tube fashioned from the greater curvature of the stomach. The result was a thick-walled tube which looks like an esophagus with a vascular supply. Radiographic studies indicate that the tube serves as an inert conduit retaining tone and permitting emptying better than a colonic prosthesis. There was no problem with stasis or reflux and the technique allows patients to lie down after eating without regurgitation. The advantages of this technique (over the Burrington and Stephens method) are that the spleen is not sacrificed and the shortest route from stomach to neck is taken (the tube is led across the thoracic cavity to the neck).

63 COMPARISON OF GROSS AND MICROSCOPIC
GASTRIC LESIONS PRODUCED IN RATS AFTER
NGLE DOSES OF ASPIRIN AND 2-DEOXYGLUCOSE. *(E.)*
gle, G. E. (Merck Inst. Ther. Res., West Point,
.), D. A. Brodie and B. G. Bauer. *Toxic Appl*
armacol 16(3):638-645, 1970.

e stomachs of vagotomized or sham-vagotomized
ltzman rats (125-150 gm) were subjected to gross
d microscopic examinations 4 hours after adminis-
ation of single doses of saline, p.o.; aspirin
28 mg/kg, p.o.); aspirin and 3 ml of 0.075 N HCl,
o.; 2-deoxyglucose (256 mg/kg, s.c.); or 2-
oxyglucose, s.c., and HCl, p.o. The animals were
lled with methohexital, the stomachs removed,
ened along the greater curvature and examined for
cidence of gross gastric hemorrhage and histologi-
l lesions. Oral administration of saline or HCl
d not produce gross hemorrhage or microscopic
sions in the rat stomach in either the sham-oper-
ed or the vagotomized group. Both aspirin and
leoxyglucose produced 100% incidence of gastric
morrhage and microscopic erosions in the sham-
erated group. When aspirin was given to the
gotomized rats, there was no gross evidence of
stric hemorrhage, but 7 of 8 rats had superficial
croscopic mucosal erosions and one rat had a deep
cosal erosion. A combination of aspirin with HCl
oduced 100% incidence of gastric hemorrhage in
gotomized rats; 6 rats with deep microscopic ero-
ns and 2 rats with superficial erosions. The
cidence of gastric hemorrhage with 2-deoxyglucose
reduced from 100% to 0% by vagotomy and erosion
evident in only one rat on microscopic examina-
n.

4 PITRESSIN AND GASTRIC ULTRASTRUCTURE. *(E.)*
Laumonier, R. (C. H. U. Rouen, France), C.
che and J. Metayer. *Rev Europ Etud Clin Biol*
4):396-404, 1970.

dies on the effects of pitressin alone or in com-
ation with cortisone on gastric mucosal struc-
e were performed on male rabbits (2 kg). Two
ups of animals were initially used: a control
up receiving physiological saline daily for 5 days,
a group receiving pitressin (10 units, i.v.) for
ays. The animals were sacrificed either on the
following (sixth day) or one month after the
ections were stopped, and the stomach was removed,
ed and treated with glutaraldehyde and osmic acid
electron-microscopic examination. A separate
up of animals received post-hypophyseal extract
cortisone acetate (30 mg, i.m.) prior to sacri-
e and the tissue was treated as above. Gastric
eration on the high part of the stomach along the
ater curvature was usually present in animals
led on the sixth day following pitressin admini-
ation. The ulcers were filled with necrotic and
orrhagic debris and the mucosal glands were di-
ed. The chief cells retained pepsinogen even at
base of the erosion. Animals treated with post-
ophyseal extract alone, or with cortisone alone,
onstrated no lesions; however, association of the
chemicals consistently gave rise to gastric le-
ns, ulcerations, fissures and gangrenous sloughs.
he fundic regions, the surface mucosal cells close to the ulcers had fewer secretion granules (unequal in size and density), whereas, the parietal cells contained numerous vacuoles and had well-developed canaliculi compared to the control specimens. The ultrastructure of the antrum was normal in all cases.

5765 ELECTRON MICROSCOPY OF GASTRIC MUCOSA IN ATROPHIC GASTRITIS. *(Fr.)* Aleman-Gavotti, C. (Dept. Anat. Path., Central U. Venezuela, Caracas), B. Bruni-Celli and J. Valencia-Parparcen. *Arch Franc Mal Appar Dig* 59(4-5):239-246, 1970.

Biopsy specimens of the gastric mucosa were studied by light and electron microscopy in 14 patients with atrophic gastritis. Light microscopic examination revealed characteristic elements of atrophic gastritis, such as a decrease in cell number, an increase in fibrous tissue, and inflammation of the corium. Electron microscopic examination of the parietal cells revealed dilated canaliculi with an apparent loss of microvilli, a large number of vesicles in the endoplasmic reticulum, and large numbers of vacuoles. The disappearance of microvilli in the canaliculi of parietal cells in atrophic gastritis apparently is related to cellular function, which would explain hypochlorhydria or achlorhydria associated with this disease.

STOMACH AND DUODENUM

Peptic Ulcers

5824 STUDIES OF THE MECHANISMS INVOLVED IN THE PRODUCTION OF STRESS AND STRESS-ATROPINE ULCERS IN RATS. *(E.)* Takagi, K. (Fac. Pharm. Sci., U. Tokyo, Japan) and S. Okabe. *Europ J Pharmacol* 10(3):378-384, 1970.

The mechanism of gastric ulcer production induced in atropinized rats under stress was investigated and compared with that of stress-induced ulcers (S-ulcer). Atropine at 1 and 10 mg/kg significantly ($P < 0.01$) reduced both volume and acid output of gastric juice under stress and under normal conditions. Under normal conditions (non-stressed) control mean volume was 5.7 ± 0.8 ml vs 2.0 ± 0.4 and 1.2 ± 0.1 ml for 1 and 10 mg of atropine, resp., in pylorus ligated rats. Mean control total acid output was 120.4 ± 22.0 μEq/hr vs 38.7 ± 12.7 and 13.9 ± 2.4 μEq/hr for 1 and 10 mg of atropine, resp. Under stress conditions, the mean control volume was 4.8 ± 0.2 ml vs 1.6 ± 0.2 and 1.5 ± 0.3 ml for 1 and 10 mg atropine, resp. The mean control total acid output was 126.5 ± 8.4 μEq/h vs 29.6 ± 7.6 and 34.8 ± 10.9 μEq/hr for 1 and 10 mg of atropine, resp. The production of both stress ulcers and stress-atropine ulcers was significantly inhibited by either calcium carbonate or chondriotine sulfate. Administration of hydrochloric acid and pepsin solution prior to stress did not however, increase ulceration. Chlorpromazine (10, 40 mg/kg) and meprobamate (300 mg/kg) significantly prevented both types of ulcers after 20 hrs of stress compared with controls. Hexamethonium (20 mg/kg) markedly suppressed stress-ulcer production and completely suppressed atropine-induced ulcers after 4 hr stress. Pentolinium (1 or 20 mg/kg) produced similar result after 20 hr stress. Laparotomy slightly suppressed development of both ulcer types ($P < 0.05$), while vagotomy completely inhibited stress ulcer production and atropine-induced ulcers. Adrenergic blockers, such as dibenamine (50 mg/kg) strongly suppressed atropine-induced ulcer formation (control ulcer index, 44 ± 0.6 vs 1.0 ± 0.3 for 50 mg/kg). Phentolamine (1 mg/kg) and tolazoline (1 mg/kg) almost completely inhibited atropine ulcer formation (0.2 ulcer index for both drugs). Although production of stress ulcers was not influenced by 50 mg/kg of phentolamine, 100 mg of dibenamine significantly decreased ulcer incidence (control 44.1 ± 3.2, vs 35.1 ± 2.4); tolazoline significantly potentiated production of ulcers (58.8 ± 2.6). Ulceration following reserpine (1 mg/kg, S.C.) was small compared with that caused by stress. Whereas stress-ulcer formation was not affected by reserpine, atropine ulcer was partly suppressed by reserpine given 1 hr prior to stress and completely by reserpine 24 hr previously. The etiology of stress-atropine ulcers seemingly is due to participation of adrenergic nerves, while stress ulcers are seemingly caused by a centrally mediated cholinergic factor.

5825 INVESTIGATION OF PANCREATIC ACTIVITY AFTER TOTAL SUBDIAPHRAGMATIC VAGOTOMY WITH YLOROPLASTY. *(Fr.)* Zotti, E. F. (Padoue Hosp., France), R. Fogar, G. Pomerri and G. F. Fasolo. *Acta Gastroent Belg* 33(1):43-50, 1970.

he effect of subdiaphragmatic vagotomy with pylorolasty on pancreatic function was studied in 20 paients who underwent surgery for peptic ulcers. easurements were made before surgery, 10 days postperatively, and 1 year later. The maximal pancreatic low and bicarbonate concentration were reduced by bout 50% ten days after surgery and returned to near ormal values after 1 year. The secretin stimulation esponse curve was unaffected with regard to these 2 arameters. Twenty min after the i.v. injection of ecretin, the mean bicarbonate concentration was 12 mEq/l before vagotomy, 70 mEq/l 10 days after urgery, and 100 mEq/l after 1 year. Secretin stimuation of amylase secretion was reduced by 55% by agotomy, but this returned to normal by 1 year. rypsin and lipase fasting levels were decreased mmediately postoperatively with a gradual return to ormal, while pH values were still low in 4 out of 5 ases after 1 year. The reduced activity of the ancreas is seemingly a transitory, completely reersible phenomenon.

826 HETEROTOPIC GASTRIC MUCOSA IN THE DUODENUM. *(E.)* Hoedemaeker, P. J. (U. Groningen, ermany). *Digestion* 3(3):165-173, 1970.

istological sections of duodenal tissue from 158 andomly obtained surgical specimens of Billroth II artial gastrectomies were examined for the occurrence f gastric mucosa with parietal cells and pepsinogen ells in the duodenal cuffs. Microscopic examination howed the presence of gastric mucosa in 52/158 speciens. The group with and the group without gastric ucosa in their duodenum were analyzed on the basis f sex, age, and the reason for gastrectomy. The only significant difference was that of the incidence of gastric and duodenal peptic ulceration. Duodenal ulceration was evident more often (52%) in the group with heterotopic gastric mucosa than in the group without (31%). Gastric ulceration was demonstrated more frequently in the group without gastric mucosa in the duodenum. Heterotropic gastric mucosa in the duodenum in cases of duodenal ulceration probably reflects an abnormal differentiation of the mucosa caused by high acidity.

5827 GASTRIC ULCERS IN SWINE: IV. EFFECTS OF DIETARY PARTICLE SIZE AND CRUDE FIBER CONTENTS OF ULCERATION. *(E.)* Baustad, B. (Vet. Coll. Norway, Oslo) and I. Nafstad. *Path Vet* 6(6):546-556, 1969.

The effects of various nutritional factors on the development of gastric ulcers were investigated in 3 experiments (92 pigs). Coarsely ground soybean meal (10%) in diet provided better protection against ulceration than did finely ground soybean meal. A watery extract of soybean meal gave some protection against ulceration in one experiment, but had no effect in another. The high incidence of gastric ulcers appeared to only slightly depress daily weight gain and the efficiency of feed conversion. In one experiment, weight gain was higher in animals fed basal ration where ulcer incidence was high than in animals fed soybean meal with low ulcer incidence. In a second experiment, a low daily weight gain and high incidence of gastric ulcers occurred in pigs fed isolated soybean protein, as compared to pigs in other lots. In a third experiment, a higher daily weight gain occurred in the group given basal ration where all stomachs had lesions than in lot fed 5% straw meal and where practically all stomachs were normal. Pigs fed 2.5% coarsely ground straw meal grew faster than pigs fed similar amounts of finely ground straw (greater incidence of ulcers). The difference in feed conversion was small, however. Five to 10% coarsely ground barley straw in diet gave full protection against ulceration, whereas 2.5% gave only partial protection. Finely ground straw as 2.5% of diet gave no protection against gastric content became significantly more fluid with increasing severity of gastric lesions.

5828 ATTEMPTS TO PRODUCE ACHLORHYDRIA IN DOGS BY REPEATED GASTRIC INJURY WITH HEAT AND COLD. *(E.)* Littman, A. (VA Hosp., Hines, Ill.), G. T. Perry and M. Littman. *Amer J Dig Dis* 15(5): 427-436, 1970.

Induction of sustained hypochlorhydria was attempted in 11 dogs with gastric fistulas given as many as 21 gastric freezing treatments, and in 8 dogs given 11 heat treatments. Freeze treatment for 60 min over 1 to 3 month periods did not lead to a prolonged and profound decrease in the secretory response to histamine. Increasing the treatment time to 70 min in 3 dogs gave an apparent satisfactory result in the first dog, but the second dog developed a gastric ulcer and the third dog had an 85% reduction which lasted only 2 months. Vasopressin (0.2 pressor units/kg/min 5 min prior to treatment) sharply decreased gastric blood flow in 3 dogs and improved the response to freezing; however, 2 dogs died during treatment and the results in the third were not satisfactory. In the heat treatments, temperatures over 50°C were fatal. In 5 dogs treated with temperatures ranging from 47 to 49°C there was one death after the first treatment, one dog survived treatments, and a third dog survived 11 treatments at 48°C with little or no effect on acid output. In all the treatments attempted, a profound and sustained reduction of histamine response occurred in only one dog. Although endoscopic and histologic evidence of repeated and severe mucosal damage was observed, recovery was fast and more complete with heating than with freezing.

5829 EFFECTS OF ADRENERGIC BLOCKING AGENTS ON GASTRIC SECRETION AND STRESS-INDUCED GASTRIC ULCER IN RATS. *(E.)* Okabe, S. (Presbyterian-U. Pennsylvania Med. Ctr., Philadelphia), R. Saziki and K. Takagi. *Jap J Pharmacol* 20(1):10-15, 1970.

The effects of adrenergic blocking agents (s.c.) on gastric secretion following pylorus ligation and on stress-induced gastric ulcers were determined in rats. Saline control values for secretory volume (6.1 ml) and total acid output (153.6 µEq/hr) were significantly reduced by phentolamine at 10 mg/kg (1.4 and 24.8 resp.), tolazoline at 10 mg/kg (4.8 and 120.4 resp.) MJ 1999 at 50 mg/kg (3.6 and 86.4 resp.), propanolol at 20 mg/kg (4.0 and 98.4 resp.) and alprenolol at 40 mg/kg (1.3 and 26.8 resp.), and carboxymethylcellulose control values (6.5 and 158.7 resp.) were significantly reduced by dibenamine at 50 mg/kg (3.5 and 79.4 resp.), ergotamine at 10 mg/kg (2.9 and 50.9 resp.) and yohimbine at 5 mg/kg (3.6 and 79.1 resp.). The ulcer index in stressed rats was lowered with significant preventive ratios (100 X control ulcer index minus the drug ulcer index / control ulcer index) by yohimbine at 10 mg/kg (62.2%), MJ 1999 at 50 mg/kg (78.7%), propanolol at 20 mg/kg (62.3%) and alprenolol at 40 mg/kg (64.3%).

5830 EXERTION ULCERS IN THE RAT. *(E.)* Robert, A. (Upjohn Co., Kalamazoo, Mich.), J. I. Northam, J. E. Nezamis and J. P. Phillips. *Amer J Dig Dis* 15(5):497-507, 1970.

Forced muscular exercise was used to produce gastric ulcers in male and female rats placed in a suspended cylindrical cage rotated at 12 rpm for 3 periods of 45 min each, separated by 2 rest periods of 15 min each (total time 2 hr, 45 min). Ulcers were found in the gastric corpus only and involved only the mucosa, and it appeared that they were initiated by an intramucosal hemorrhage leading to necrosis of a segment of the mucosa. Feeding prior to exertion completely prevented the formation of ulcers. Ulcerations in males was 55% less than in females of the same body weight. Methscopolamine bromide (50-1000 µg/rat), an antacid preparation (Malcogel), mercuric acetate, and prednisolone (0.5-2.0 mg/rat) prevented ulcer formation (dose dependent). Adrenalectomy and deoxycorticosterone had no effect on the ulcers. Chlorpromazine inhibited the formation of ulcers (also dose dependent); the number of actively running rats diminished as the doses increased). During exertion, the volume and acidity of the gastric juice were reduced (from 5.8 to 3.7 ml/3 hr and from 91 to 61 mEq/l, resp.). The technique of forced muscular exercise for the production of ulcers is suggested as an assay for antiulcer agents due to its rapidity, simplicity, reproducibility, and quantitation.

5855 ABSORPTION OF DRUGS *IN VITRO* FROM THE RAT INTESTINE DAMAGED BY TRIPARANOL OR IRRADIATION. *(E.)* Mattila, M. J. (Dept. Pharmacol., U. Helsinki, Finland), L. R. Holsti, V. M. K. Venho and S. Takki. *Arzneimittelforschung* 20(4):533-538, 1970.

In vitro absorption of various drugs was studied in perfused isolated Sprague-Dawley rat intestine damaged by 2-(p-chlorophenyl)-1-[p-diethylaminoethoxy) phenyl]-1-p-tolyl) ethanol (triparanol) or irradiation. Treatment with triparanol, 25-50 mg/kg every 24 hr for 3 weeks, resulted in retarded weight gain, lowered serum cholesterol (mean 449 ± 35 μg/ml vs 842 ± 145 μg/ml for controls) and intestinal inflammation. Another type of intestinal lesion was produced by the whole-body ^{60}Co irradiation of 750 rad. Absorption of morphine hydrochloride and butylscopolamine hydrobromide from control intestine was low but butylscopolamine was slightly more absorbed than its low lipid solubility indicated. Treatment with triparanol improved absorption of both morphine and butylscopolamine. Mecamylamine absorption was superior to that of morphine and butylscopolamine and was not modified by triparanol treatment. Aminophenazone, phenobarbitone sodium, and ethionamide were well absorbed; acetylsalicylic acid absorption was less. Triparanol reduced phenobarbitone absorption but did not affect other compounds; hydrolysis of acetysalicylic acid was not modified by triparanol. Irradiation did not modify absorption of aminophenazone, morphine, or isoniazid, but blocked butylscopolamine absorption entirely on days 3 and 6 post-irradiation. Phenobarbitone and phenytoin absorption was impaired on day 6 post-irradiation. Changes in drug absorption due to intestinal damage seemingly are relatively slight and unpredictable depending on injury and the drug involved.

5877 MORTALITY IN CROHN'S DISEASE. *(E.)* Prior P. (Dept. Soc. Med., U. Birmingham, England), J. F. Fielding, J. A. Waterhouse and W. T. Cooke. *Lancet* 1(7657):1135-1137, 1970.

A follow-up study for between one and 38 years was conducted in 295 patients with Crohn's disease. During this period 53 patients died (more than twice the number expected for the general population of similar age and sex distribution). Excess deaths were significant for both males and females, and for those patients who had symptoms before age 40. Deaths in the group with blood disorders (3) and in the group with igestive disorders (26) were more than the number xpected, but none of the remaining groups showed a ignificant deviation from expectation. When grouping all causes of death, the expected deaths were 4.46 and 7.93 for males and females, resp., compared o observed deaths of 34 and 19 for males and females, esp. Although the disease itself was mainly responsible for excess mortality, side-effects of steroid herapy and malignancy of the gastrointestinal tract eemingly contributed to mortality.

378 IgM TURNOVER IN CROHN'S DISEASE. *(E.)* Jensen, K. B. (Bispebjerg Hosp., Copenagen, Denmark), N. Goltermann, S. Jarnum, B. Weeke nd H. Westergaard. *Gut* 11(3):223-228, 1970.

Simultaneous studies of the size of abnormal intestinal protein loss estimated by means of ^{59}Fe-labeled iron dextran and by radioiodine-labeled IgM and IgG turnover, were made in 12 patients with Crohn's disease. A weighted amount of the labeled IgM and IgG (0.15 μC of ^{125}I and 0.40 μC of ^{131}I per kg body weight) and ^{59}Fe-iron dextran (2 to 3 μC i.v.) and blood was sampled 10 min after injection and at daily intervals for 3 weeks. IgM was isolated by Sepharose 4B gel filtration and IgG by means of DEAE cellulose chromatography. Stool and urine specimens were collected for up to 3 weeks. Serum IgG in 3 patients was slightly elevated to 15.5, 15.5 and 16.1 g/l, and was lowered to 5.7 g/l in one patient, compared with a normal range of 7.2 to 15.1 g/l. One patient had agamma-A-globulinemia with serum IgM of 0.14 g/l (normal range: 0.23 to 1.33 g/l), and one patient had a diffuse hypogammaglobulinemia, with a serum IgA of 0.02 g/l (normal range: 0.74 to 3.06 g/l). The remaining 11 patients had normal serum IgM concentrations. The fractional catabolic rate of IgM in 11 patients was increased to a range of 14.6 to 36.3% /day compared with a normal range of 8 to 15%/day, and the catabolic rate of IgG was increased to a range of 7.3 to 20.4%/day, above a normal range of 4.0 to 9.6%/day. A positive correlation between the catabolic rate and the serum concentration of IgM was present ($r = 0.53$, $P > 0.02$); however, no positive correlation was found between the catabolic rate of IgM and IgG. The rate of synthesis of IgM was markedly raised or a high normal (6.8, 6.9, 15.1, 19.3 mg/kg/day) in 4 patients with an intraabdominal abscess, and in the remaining cases it was within the normal range of 0.8 to 8 mg/kg/day. The synthesis rate of IgG was elevated to a range of 49 to 175 mg/kg/day in 11 patients, compared with a normal range of 10 to 49 mg/kg/day. A moderate intestinal protein loss was demonstrated in all cases by ^{59}Fe-iron dextran turnover. The fecal ^{59}Fe content ranged from 1.8 to 6.4% of the injected dose and the fecal clearance from 2.1 to 8.3% of the intravascular ^{59}Fe-iron dextran pool per day. The size of protein loss was not related to the increased catabolic rates of IgM and IgG; however, there was a close correlation ($r = 0.92$, $P > 0.001$) between fecal excretion of the labels from IgM and IgG.

5879 THE INCIDENCE AND RELIABILITY OF INDIVIDUAL RADIOGRAPHIC SIGNS IN THE SMALL INTESTINE IN CROHN'S DISEASE. *(E.)* Dyer, N. H. (St. Bartholomew's Hosp., London, England), C. Rutherford, J. H. Visick and A. M. Dawson. *Brit J Radiol* 43(510):401-408, 1970.

Radiographs of barium meal and follow-through examinations of 50 patients with Crohn's disease, 25 patients with malabsorption syndrome and 25 controls (diarrhea) were assessed independently by 2 radiologists to determine the incidence and reliability of individual radiographic signs. Intestinal contraction (64% of cases, 12% observer variation) and rigidity (26% of cases, 14% observer variation) were the most reliable commonly accepted signs of Crohn's disease upon examination. Cobblestone mucosa, longitudinal streaks of barium in the wall, and ulceration (marked mucosal irregularity and clefts) were occasionally reported in controls or malabsorption cases. The most frequent and reliable signs of Crohn's disease (25% or more incidence with observer variation of less than one-half agreed incidence) were ulceration, marked surface irregularity, clefts, rigidity, and contraction. Cobblestone mucosa and stenosis were frequent but unreliable signs (25% or more incidence with frequent observer variation). Infrequent signs in Crohn's disease (25% or less incidence and considerable variation) were skip lesions, featureless mucosa, slight surface irregularity, and longitudinal streaking in walls and fistula. Stippling or flocculation of barium occurred in 40% of cases of Crohn's disease, but was less frequent and less severe than in malabsorption syndrome. Terminal ileum was also demonstrated in 70% of cases of Crohn's disease. Mucosal fold thickness and separatio between folds in duodenum and jejunum were similar in controls and patients with Crohn's disease. In malabsorption, folds were thicker with observer variation common. Jejunal loop width in Crohn's disease was intermediate between widths in the other two groups.

5885 SCANNING ELECTRON MICROSCOPY OF NORMAL AND CELIAC JEJUNAL MUCOSA. *(E.)* Cooke, W. T. (Gen. Hosp., Birmingham, England), P. Asquith and A. G. Johnson. *Amer J Dig Dis* 15(6):511-521, 1970.

Suction biopsies of jejunal mucosa from 12 normal subjects and from 10 patients with adult celiac disease were studied using a scanning electron microscope. Biopsy specimens were obtained from fasting and subjected to routine dissecting microscopy and histopathology (fixed in sucrose phosphate buffer, freeze-dried, and coated with carbon and metallic silver prior to examination by electron microscope) The mucosal pattern of normal subjects revealed nor mal villi with flat surfaces, composed of regular hexagonal cells (9 μ diameter and traversed by fur-

rows of varying depth. Interspersed among the
epithelial cells were the openings of goblet cells
(8 µ diameter containing mucus, and at the base of
he central villi there were 24 crypt openings (35-
0 µ diameter). The mucosal appearance in subjects
ith adult untreated celiac disease was markedly
ifferent from normal. The epithelial cells were
maller (7.5 µ diameter and more rounded and dome-
haped than the normal epithelium, and irregular
ut well developed microvilli (0.15 µ diameter were
bserved. The mucosal appearance in celiac disease
uggests a losse attachment of cells to each other
nd to the supporting connective tissue. These find-
ngs suggest a mechanical explanation for the in-
reased cell loss and turnover in celiac disease.

886 THE CLINICAL SIGNIFICANCE OF LACTOSE MALABSORPTION. *(E.)* Gundmand-Hoyer, E. (Hosp. U.
und, Sweden), A. Dahlqvist and S. Jarnum. *Amer J Gas-
roent* 53(5):460-473, 1970.

he clinical symptoms found in 25 patients with lac-
ose malabsorption (18 with other gastrointestinal
isorders), and their reactions to one of 3 types of
ietary therapy, (milk-free, milk and milk-product
ree, and lactose-free) were described. The proximal
ejunum of each patient was biopsied for histological
tudy and enzyme activity assay, and sugar tolerance
ests were performed. In response to the lactose-
olerance test, all patients complained of gastro-
ntestinal symptoms of diarrhea, abdominal pain or
loating, and in all patients there was a blood glu-
ose elevation of from 6 mg% to a high of 33 mg% (in
diabetic patient). The glucose-galactose tolerance
est produced a normal rise in blood sugar, and only 5
tients complained of slight abdominal symptoms. The
st common symptoms associated with lactose malab-
rption were mild to moderate diarrhea in 84% of
e patients, borborygmia, bloating or flatulence
64%, and moderate to severe abdominal pain in
% of the patients. Other symptoms were steator-
ea (3 patients), intestinal protein loss (1 pa-
ent with Chron's disease) and drowsiness following
ctose test (3 patients), which resembled alcohol
toxication. Only 8 patients had spontaneously
served the relationship between milk intake and
eir symptoms. The milk-free diet was not able to
olish symptoms in most patients. In two-thirds
the patients, a diet without milk or milk prod-
ts was sufficient to abolish the symptoms, and
one-third of the patients, only a lactose-free
et abolished symptoms.

87 A CASE OF WHIPPLE'S DISEASE: BACTERIOLOGICAL AND MORPHOLOGICAL STUDY. *(Fr.)* Sarles,
(INSERM, Marseilles, France), Y. Peloux, F. Tasso,
Lebreuil, J. Tamalet and P. Fournier. *Path Biol*
(3-4):129-140, 1970.

mesenteric ganglion was obtained for bacteriological
amination during surgical intervention on a patient
th Whipple's disease. This resulted in the isolation
a *corynebacterium.* At the onset of illness the
tient was 45 years old and complained of joint pain;
ter 6 years he had episodes of diarrhea (15 to 16 stools daily) with diffuse abdominal pain. The patient responded well to treatment with demethylchlortetracycline (mexocyne at 2 g/day), but suffered a relapse whenever the medication was discontinued. The patient was rehospitalized at age 64 and a jejunal biopsy specimen showed massive infiltration of histocytes into the chorion and many free bacteria. After 5 years (with continued medication) the patient complained of abdominal pain. Investigation revealed biochemical changes reflecting some liver damage (bilirubin, BSP, sedimentation rate, etc.). A cholecystectomy was performed for gallbladder lithiasis, and during surgery the wall of the jejunum was observed to be thickened and overrun with dilated lymph nodes. The anatomopathological examination showed typical changes due to Whipple's disease: lymphangiectasia, numerous frothy histocytes, and often plasmodia with Sieracki corpuscles. A culture of the mesenteric lymph node was instrumental in the isolation of the *Corynebacteria.* Electron microscopy revealed changes in the chorion, numerous lysosomes in the cytoplasmic organization of the epithelial cells, widening of the intercellular spaces (particularly around the base of the epithelium). Some areas of the chorion were infiltrated by a large number of corpuscles (short rods comparable to bacteria described in Whipple's disease). The bacteria dispersed in the chorion, or enclosed in the vacuoles of phagocytes, differ in their structure from each other, and divided according to the particular characteristics of gram + bacteria. The identification of the *corynebacteria* in this disease confirms the findings of Caroli and Prevot.

Ulcerative Colitis

5946 THE DIAGNOSTIC VALUE OF MUCOSUBSTANCES IN RECTAL BIOPSIES FROM PATIENTS WITH ULCERATIVE COLITIS AND CROHN'S DISEASE. *(E.)* Filipe, M. I. (Westminster Med. Sch., London, England) and I. Dawson. *Gut* 11(3):229-234, 1970.

Sixty-two rectal biopsies from 36 patients with ulcerative colitis and 29 biopsies from 15 patients with Crohn's disease were studied relative to content of neutral, acid non-sulfated and sulfated mucosubstances. Investigation revealed a marked decrease in mucosubstances in most cases of ulcerative colitis, but no corresponding decrease in patients with Crohn's disease. In both diseases, there was a general reduction in acid non-sulfated and sulfated mucosubstances, but reduction affected non-sulfated less than sulfated. Decreased mucosubstance was related to the intensity of inflammation in lamina propria, but not to duration of disease. In the colitis group, 36/62 rectal biopsies had a heavy inflammatory cellular infiltrate in the lamina propria; 29 of this group showed a marked mucosubstance decrease, 4 a patchy decrease, and 3 had normal amounts. In the Crohn's disease group, although 8 biopsies showed severe and 21 moderate or mild inflammatory changes in lamina propria, mucosubstances were reduced in only 2 biopsies. Techniques for mucosubstances seemingly are of value in differentiating between the two diseases in rectal biopsies.

5947 MODIFICATION OF *IN VITRO* TOXICITY OF LYMPHOCYTES FROM PATIENTS WITH CHRONIC ULCERATIVE COLITIS OR GRANULOMATOUS COLITIS FOR ALLOGENIC COLONIC EPITHELIAL CELIS. *(E.)* Shorter, R. G. (Mayo Clin., Rochester, Minn.), M. R. Cardoza, S. G. ReMine, R. J. Spencer and K. A. Huizenga. *Gastroenterology* 58(5):692-698, 1970.

Lymphocytes from 12 patients (5 with active chronic ulcerative colitis and 7 with granulomatous colitis) were incubated in the presence of the lipopolysaccharide extract of *E. coli* 0119:B14, the tuberculin preparation purified protein derivative or phytohemagglutinin-P, followed by the testing of the lymphocytes for their cytotoxic effects *in vitro* on allogenic colonic epithelial cells. Normal subject lymphocytes showed no cytotoxicity for colonic cells initially and those incubated alone remained noncytotoxic after 4 days (colonic cell viability · 90% in all instances at each interval). Similar findings were obtained after 4 days in the 6 tests n which lymphocytes had been incubated in the presence of phytohemagglutinin-P and also in the 4 ests in which they were exposed to the tuberculin reparation. However, in the 6 tests in which lymhocytes were incubated for 4 days in the presence f *E. coli* extract, they became cytotoxic for coonic cells (mean viability: 68.33 ± 5.04%). Iniially, lymphocytes from all patients with chronic lcerative colitis or granulomatous colitis were ytotoxic for colonic cells (mean viability: 70.58 ± 1.59%, range: 34 to 76%), after 4 hr of mixed inubation at 37° C. After 4 days of incubation alone, he lymphocytes retained their cytotoxic effects. When lymphocytes from any of the 12 patients were ncubated for 4 days in the presence of *E. coli* extract, they showed considerably little cytotoxic effect (mean colonic viability: 90.08 ± 2.97% range, 84-95%). This effect did not occur when the lymphocytes were incubated with phytohemagglutinin-P or the tuberculin preparation purified protein derivative. It may be that the *E. coli* extract is a specific antigen and that its preincubation with sensitized lymphocytes resulted in their desensitization and that the phenomenon of cytotoxicity for colonic cells might be a final expression of delayed hypersensitivity *in vitro*.

PANCREAS

Pancreatitis

5960 CLINICAL TRIAL WITH TRASYLOL IN ACUTE PANCREATITIS. *(Ger.)* Moller, C. (4th Surg. U. Clin., Helsinki, Finland) and L. Stjernvall. *Ann Chir Gynaec Fenn* 58(4):296-299, 1969.

The clinical effects of Trasylol (an enzyme inhibitor) in high doses (300,000-500,000 KIU daily) on patients (45 control; 43 treatment) with acute pancreatitis was studied. Trasylol had no significant effect on mortality (2.3% with Trasylol; 4.2% without), or regression of pain (3.7 days with Trasylol; 3.3 days without). However, elevated blood leucocytes (>8,000/mm^3: 8.6 days with Trasylol; 6.5 days without) and pyrexia (>38° C: 8.8 days with Trasylol; 5.6 days without) remained longer, the difference being significant. Intestinal paralysis and increased diastasuria were equal in both groups.

5961 THE CONNECTION BETWEEN THE ADRENAL CORTEX AND LIPOLYTIC PANCREATITIS: DEMONSTRATED IN A MODEL "CORTISONE-PANCREATITIS". *(Ger.)* Wanke, M. (Path. Inst. U. Heidelberg, Germany) and G. Horeyseck. *Z Gastroent* 8(2):86-95, 1970.

The effect of long-term cortisone treatment on pancreatic lipase and morphology was studied in 40 male, Wistar rats by enzyme assay. Animals were divided into 5 groups (I) control, (II) 7 mg cortisone/kg/day for 41 days, (III) 7 mg cortisone/kg/day for 55 days, (IV) 5 mg cortisone/kg/day for 6 days, and 6.7 mg/kg/day for following 14 days, (V) 24 mg lipase into pancreatic duct. Lipase was increased in pancreatic homogenates (normal—7065 I.U./g; (II)—7744 I.U./g; (III)--10,300 I.U./g; (IV)--11,685 I.U./g). The increase in enzyme activity and tissue changes were directly related to adiposity. In addition to necroses in peripancreatic, interpancreatic and abdominal fatty tissues, perifocal primary leucocytic and, later, round cell infiltration was found in the pancreatic acini. The morphological changes resulting from cortisone treatment and lipase instillation are similar to the type of damage caused by lipase concentration in internal adiposity.

LIVER AND BILIARY TRACT

5980 GASTRIC IRON BINDING SUBSTANCE (GASTROFERRIN) IN A FAMILY WITH HEMOCHROMATOSIS. *(E.)* Deller, D. J. (Dept. Med. U. Adelaide, Australia), R. G. Edwards, G. Dart, C. G. Luke and P. S. Davis. *Australasian J Med* 18(1):36-42, 1969.

Elevation of serum iron level, percentage iron saturation, degree of radioiron absorption, urinary iron excretion following diethylenetriaminepentaacetic acid (D.T.P.A.) administration and gastric juice iron inding substance (gastroferrin) were studied in the relatives of a patient with hemochromatosis to obtain evidence for the implication of a gastroferrin deiciency in the disease. Six of the 31 relatives 19%) had abnormal test results indicative of iron overload (serum iron levels above the normal range of 71 to 210 μg/100 ml for men and 65 to 175 μg/100 ml for women, percentage iron saturations above the ormal 22 to 73% for men and 18 to 56% for women, and urinary excretion of iron after D.T.P.A. administration bove 0.5 mg iron over a 5 hr period). Radioiron aborption was not related to the other parameters of isturbed iron metabolism but 5 of the 6 relatives ith iron overload showed reduced levels of gastroerrin and the 1 with a normal level had a liver with atty infiltration and extensive fibrosis similar to hat of the patient. Data support the hypothesis that emochromatosis may be the result of an inborn error f metabolism in which there is failure to produce astroferrin (thus inhibiting iron absorption).

981 ANGIOGRAPHIC STUDY OF THE COLLATERAL CIRCULATION TO THE LIVER AFTER LIGATION OF HE HEPATIC ARTERY IN MAN. *(E.)* Bengmark, S. (Dept. Surg., U. Gotegorg, Sweden) and K. Rosengren. *Amer Surg* 119(6):620-624, 1970.

he development of collateral hepatic circulation ollowing ligation of the hepatic artery at different levels (7 cases) or total dearterialization of he liver (3 cases) was studied in 10 patients who ere subjected to aortographies and selective angioraphies (Urografin as contrast medium) before and fter (from 15 to 240 days) the surgical procedure. ine patients had malignant hepatic tumors originaing from primary tumors in various locations, and he tenth had a hematoma in the lesser omentum. In 2 patients the left hepatic artery was not ligated, and angiographies for both cases, performed 120 days and 15 days after the ligation, were similar in appearance and collateral vessels from the left hepatic artery filled the branches of the right hepatic artery. In six cases both the right and the left hepatic arteries were filled with the contrast medium via the collaterals. The most rapidly developing manifestations of collateral circulation were networks of vessels from the pancreaticoduodenal arteries from the proximal part of the main hepatic artery, and from the intercostal arteries. Filling of the arterial hepatic tree was observed by aortography at 4 days after hepatic artery ligation. Complete dearterialization of the liver was attempted in one subject 60 days after ligation of the hepatic arteries. Arteriograms taken 15, 90 and 180 days after this procedure were similar and showed only slight filling of the hepatic arteries via much fewer collateral vessels.

5982 INCREASED IRON ABSORPTION IN HEMOCHROMATOSIS BEFORE AND AFTER PHLEBOTOMY THERAPY. *(E.)* Sargent, T. W. (Donner Lab., Lawrence Radiat. Lab., U. California, Berkeley), H. Saito and H. S. Winchell. *Lawrence Radiat Lab Semiann Rep Biol Med* [UCRL 19420]:30-39, 1969.

Serial iron absorption studies in 8 patients with endogenous hemochromatosis were performed before, during, and after phlebotomy therapy, the results of which were related to the state of erythropoiesis and iron stores at the time of each study. In normal subjects (26), the fraction of iron absorbed from a normally administered dose varies directly with the reticulocyte count (correlation coefficient: 0.77). In iron deficiency anemia (plasma iron concentration > 70 μg %), absorption of iron was increased disproportionate to the reticulocyte count; when 2 such patients received sufficient iron (i.v.) to abnormally elevate the serum iron concentration, iron absorption was decreased disproportionately to the reticulocyte count despite only a mild change in the degree of anemia. In the 8 hemochromatotic subjects, when the plasma iron concentration was elevated (> 170 μg %) and the absorption test was given prior to phlebotomy, iron absorption was within the normal range with regard to reticulocyte count in 6 of 8 cases; in the other 2, one case was above and one below this range. When iron stores had been depleted and the plasma iron concentration was below normal (but in the absence of significant anemia), iron absorption was always above the normal range, as occurs in nonhemochromatotic patients with iron deficiency. When depleted patients were tested 2 months or more after their last phlebotomy, at a time when they were normochromic and normocytic and the plasma iron concentration was within normal limits, the iron absorption with regard to reticulocyte count was above the normal range in 8 of 8 patients. Patients with hemochromatosis appear to have a congenital defect which permits excessive absorption of iron from a diet containing normal amounts of this element.

5983 SUBCELLULAR LOCALIZATION OF *SALMONELLA ENTERITIDIS* ENDOTOXIN IN LIVER AND SPLEEN OF MICE AND RATS. *(E.)* Willerson, J.T. (Natl. Inst. Hlth., Bethesda, Md.), R.L. Trelstad, T. Pincus, S.B. Levy and S.M. Wolff. *Infect Immun* 1(5):440-445, 1970.

Cellular and subcellular localization of ^{14}C-labeled *Salmonella Enteritidis* endotoxin was characterized in liver and spleen fractions from Swiss mice and Sprague-Dawley rats by scintillography and autoradiography. ^{14}C-endotoxin was found predominantly in nuclear and mitochondrial subcellular fraction of both liver and spleen in both animals, 3.5 hr and 3 days after i.v. administration. The amounts of radioactivity recovered from both organs in mice and rats 3 days after endotoxin administration was 30-50% of counts in same fractions 3.5 hr after endotoxin administration. Hot phenol extracted 20-40% of labeled material from nuclear and mitochondrial fraction and of the recovered radioactivity, 10-20% was present in liver mitochondrial fraction as high molecular weight, biologically active material (apparent grossly intact endotoxin, possibly bound to protein). Material extracted by phenol from liver mitochondrial fractions of pretreated and previously untreated rats and mice showed pyrogenic activity compared to no activity from control subcellular fraction. Autoradiographic studies demonstrated nuclear and cytoplasmic labeling in the liver and spleen cells. Apparent resistance of rats (compared to mice) to experimental induction of amyloidosis does not appear to be based on difference in subcellular localization of endotoxin within reticuloendothelial system.

5984 CLINICAL TRIAL ON A NEW COMBINATION OF HEPATOPROTECTING AGENTS. *(E.)* Barlattani, M. (Dept. Med. U. Rome, Italy). *Arzneimittelforschung* 20(4):560-565, 1970.

Clinical trials on a new combination of hepatoprotecting drugs (extractive sulfonating polysaccharide, rutin, lipocaic factor, inositol, dehydrocholic acid) were performed in 25 patients suffering from liver diseases. Administration of 6 dragées daily, in 3 divided doses before meals, lasted 30 days; laboratory tests were performed at beginning of treatment and after 15 and 30 days. Laboratory tests were normal in most instances; however, total bilirubinemia (at a higher rate than 1 mg % in 76% of patients) was normalized in 24% of patients at 15 days, and in 44% of the patients after 30 days. Urobilinuria, present in 56% of patients, gradually returned to normal, decreasing to 52% after 15 days and to 20% after 30 days (20% of patients showing intense urobilinuria before treatment presented slight effects at 15 days). Cholalemia, present in 20% of patients at the start of the study, dropped 4% and 8% on days 15 and 30, resp. Glycemia, which exceeded normal values in 52% of patients at the beginning of the study showed 32% and 44% normalization after 15 and 30 days, resp. Cholesterolemia was higher than normal in 56% and lower in 16% of patients at the beginning of the study; after 15 days, values above normal showed 20% normalization, while values below normal showed a 4% elevation. Serum colloid tests demonstrated that levels were not normalized after 30 days of treatment. Lack of normalization seemingly is due to changes in other tissues or systems; the mentioned condition causes colloid alteration owing to lack of correction normally exerted by healthy liver.

5985 THE DONOR IN HUMAN LIVER TRANSPLANTATION. *(E.)* Fortner, J. G. (Mem. Hosp. Cancer Allied Dis., New York, N. Y.), M. H. Shiu, W. S. Howland and E. J. Beattie, Jr. *Surg Gynec Obstet* 130(6):988-994, 1970.

While extensive study of a donor candidate for human liver transplantation is usually not feasible, the clinical history of the donor, the gross physical appearance of the organ and the results of histologica and biochemical studies are important criteria in judging suitability. In 6 consecutive human liver homographs, the donors studied were persons who had fatal brain damage, intact livers, and sustainable blood pressure. A past medical history of encephalitis precluded the use of 2 donor candidates, as did extreme age (99 yr) and the presence or history of cancer. Roentgenologic studies and selective celiac angiography were used to evaluate liver status and to delineate the pattern of the hepatic arterial supply. Bacteriologic studies were obtained in all patients and donors prior to transplantation. In matching donor and recipient, liver size (not age, sex, or race) was the determining factor. Red blood cell compatibility between donor and recipient was of great importance and human leukocyte antigen typi was based on leukagglutinin and cytotoxicity tests. The donor was maintained in a normotensive state whi mobilization of the donor's liver was carried out. The dissection was made difficult whenever the hepat arterial pulsation ceased prematurely, and this difficulty was compounded by the location of the celiac ganglion at the base of the hepatic artery and the celiac axis. Perfusion of the liver with a modifie low molecular weight Dextran and balanced salt solution was done through the portal vein and hepatic artery, until the liver was ready to receive anastomosing blood vessel grafts from the recipient patien The transplanted livers functioned well, as indicate by lack of hemorrhagic diathesis after transplantation, prompt return of consciousness after anesthesi and continued viability of the patients.

986 TYPE III GLYCOGENOSIS: A BIOCHEMICAL AND ELECTRON MICROSCOPIC STUDY. *(E.)* Garancis,
. C. (Marquette Med. Sch., Milwaukee, Wisc.), R. R.
anares, T. A. Good and J. F. Kuzma. *Lab Invest*
2(5):468-477, 1970.

Electron microscopic and biochemical analysis of
liver, muscle, and leukocytes were performed on
iopsies from 2 infant girls (8 months and 3 yr)
ith type III glycogenosis. The basophils, neutro-
hils, and eosinophils from the peripheral blood
ontained excessive glycogen deposits; normal levels
ere found in the lymphocytes and monocytes. Ele-
ated glycogen content and a deficiency of amylo-1,
-glucosidase were found in liver, skeletal muscle
nd leukocytes. Hepatic parenchymal cells typically
ontained large pools of monoparticulate glycogen
dmixed with glycogen rosettes. Small aggregates
ere seen in the ground substance, fibrocytes, and
upffer cells and skeletal muscle contained excessive
mounts of monoparticulate glycogen between myo-
ibrils; however, there was no evidence of fiber
egeneration. In the more severely affected muscle
ibers, large aggregates of glycogen appeared just
eneath the sarcolemma. Deposits were also seen in
he ground substance,endothelium, and pericytes. The
ound to ovoid β-particle subunits of liver and muscle
lycogen measured approximately 45 to 50 and 35 to 50
, resp., and their morphological appearance was in-
istinguishable from glycogen subunits of control
pecimens.

987 HISTOCHEMICAL STUDY ON CARBOHYDRATE METABOLISM OF ASCITES HEPATOMA AH 13 AND AH 39
ELLS. *(E.)* Yano, Y. (Kumamoto U. Sch. Med., Japan).
ta Histochem Cytochem 2(4):147-163, 1969.

ifferences in the metabolic pattern between rat
scites hepatomas AH 13 and AH 39 were investigated
sing histochemical observations of enzymes in carbo-
drate metabolism in tumor cells *in vivo* and *in*
tro. An anaerobic glycolytic pathway was demon-
rated in the AH 13 cells which showed intense
stochemical reactions for glucosephosphate isom-
ase, aldolase, and lactate dehydrogenase. Glycogen
tabolism was also demonstrated with predominant
ycogenesis showing a histochemical reaction for
PG-glycogen glucosyltransferase and with a less
edominant glycogenolysis showing an intense reac-
on for phosphorylase. Phosphoglucomutase was also
monstrated in the AH 13 cells and also glycogen
posits in the tumor cell bodies. AH 39 cells exhib-
ed a similar anaerobic pathway but it was not
companied by the same glycogen metabolism. The
lls demonstrated poor glycogenesis and a moderately
ak reaction for phosphorylase and phosphoglucomutase
d there were no glycogen deposits in the cell bodies
cept in the later stage after inoculation. Long-
rm cultivation of both strains produced changes in
e enzymatic properties of the tumor cells. In the
13 cells glycogen storage was increased and accom-
nied by an increase in phosphoglucomutase activity
d decreases in glucosephosphate isomerase and phos-
orylase activities. In the AH 39 cells glycogen
orage increased in spite of increasing phosphor-
ase activity. Glycogenesis appeared to be inten-
fied by the cultivation and by the reduction of
ucosephosphate isomerase activity.

5988 CROSS TRANSFUSION OF EFFLUENT BLOOD FROM ISCHEMIC LIVER AND INTESTINES. *(E.)* Rangel, D. M. (U. California Los Angeles, Sch. Med.), A. Dinbar, G. H. Stevens, J. E. Byfield and E. W. Fonkalsrud. *Surg Gynec Obstet* 130(6):1015-1024, 1970.

Studies were made in 48 dogs of the effects of cross transfusion of venous effluent blood following 2 hr of hepatic or intestinal ischemia from one dog into a second dog. The biochemical and hemodynamic responses of the recipient dog were studied. No hypotension occurred when effluent blood from a nonischemic liver was cross-transfused into the femoral vein of the recipient dog. A decrease in blood pressure of more than 50 mm Hg occurred in 4 of the 5 dogs when effluent blood was cross-transfused from a liver subjected to 2 hr of hepatic inflow stasis. The hypotension occurred when 150-250 ml of blood had been cross-transfused and lasted for 22 to 65 min. Central venous pressure decreased to zero during severe periods of hypotension. When hepatic effluent blood (after 2 hr of hepatic ischemia) was cross-transfused through the pancreatic vein at 20 cc/min, severe hypotension occurred in one of 5 dogs, moderate hypotension developed in 3 dogs, and in one dog there was no decrease in blood pressure. Severe hypotension developed in 4 of 5 dogs receiving portal venous blood from donor dogs in which the superior mesenteric artery had been occluded for 2 hr and subsequently revascularized; there was no change in central venous or portal pressure in this group. Hypotension did not occur in any of the 5 recipient dogs receiving portal venous blood from donor dogs in which the portal vein had been occluded above the origin of the pancreatic vein for 60 min. Elevations of the levels of SGOT (from 28 ± 14 to 212 ± 41 Sigma-Frankel U), SGPT (30 ± 11 to 198 ± 81 Sigma-Frankel U), alkaline phosphatase (18 ± 8 to 26 ± 9 IU), and lactic dehydrogenase (134 ± 89 to 990 ± 381 Berger-Broida U) occurred only in the venous effluent blood from the postischemic livers. Hyperkalemia and metabolic acidosis occurred commonly in venous effluent blood after hepatic or intestinal ischemia, but neither appeared to be causative of systemic hypotension.

5989 EFFECTS OF PHENETHYL ALCOHOL ON TRANSPORT REACTIONS, NUCLEOTIDE POOLS AND MACROMOLECULAR SYNTHESIS IN NOVIKOFF RAT HEPATOMA CELLS GROWING IN SUSPENSION CULTURE. *(E.)* Plagemann, P. G. W. (Med. Sch., U. Minnesota, Minneapolis). *J Cell Physiol* 75(3):315-327, 1970.

The effects of phenethyl alcohol (PEA) on metabolic processes (transport reactions, nucleotide pools and macromolecular synthesis) were studied in Novikoff rat hepatoma cells growing in suspension culture. Incorporation of ^{3}H-amino acids or ^{3}H-thymidine into total cell and acid-insoluble material was inhibited by the different concentrations (8, 16 and 24 mM) of PEA (approximately 30%, 50% and 57% resp. for the amino acids and approximately 45%, 70% and 90% resp. for thymidine). Pulse labeling of RNA with ^{3}H-uridine in the presence of the varying concentrations of PEA indicated no effect on incorporation of uridine nucleotides although there was accelerated loss of nucleotides from the cells, but pulse labeling of DNA with ^{3}H-thymidine indicated a decrease of incorporation into the acid-insoluble material (1700 cpm/0.5 ml without PEA decreased stepwise with PEA to 400 cpm/0.5 ml at 24 mM). Sedimentation profiles of RNA revealed a steady decrease of ^{3}H-uridine incorporation into 29S and 18S rRNA with increasing PEA (35, 27 and 13% of total ^{3}H and 7, 4 and 2% of total ^{3}H in the 29S and 18S rRNA resp.) with no change in 4-5S RNA labeling indicating the PEA inhibits the processing of ribosomal precursor RNA to rRNA, while the loss of labeling in the 29S and 18S rRNA suggests a degradation of the rRNA since tRNA labeling remained constant whether PEA was added or not. All the effects of PEA may result from an interaction with cellular membranes

5990 CHEMICAL PATHOLOGY OF ACUTE AMINO ACID DEFICIENCIES: STUDIES ON HEPATIC ENZYMES IN RATS FORCE-FED A THREONINE-DEVOID DIET. *(E.)*

Sidransky, H. (U. Pittsburgh Sch. Med., Pa.), D. S. Wagle, M. Bongiorno and E. Verney, *J Nutr* 100(6):678-684, 1970.

Male and female Sprague-Dawley rats, (most of them weighing 75 - 85 g) force-fed a threonine-devoid diet for 3 days, exhibited a significant increase in glucose-6-phosphate dehydrogenase activity and significant decrease in activities of phosphorylase, urocanase and the hydroxylating enzyme compared with animals fed a complete diet. The activities of glycogen synthetase, malic enzyme, threonine dehydrase, arginase, histidase and acid phosphatase showed no significant differences between the experimental and control animals. In 3 experiments where hepatic arginase activity was determined, there was an 88% average increase in excretion of urine urea in those animals receiving the threonine-devoid diet.

5991 LIPID PEROXIDATIVE PROCESSES IN LIVER DAMAGE AND STEATOSIS. *(E.)*

Placer, Z. (Inst. Human Nutr., Prague, Czechoslovakia), M. Vidlakova and L. Kuzela. *Rev Czechoslovak Med* 16(1):29-39, 1970.

The relation between liver peroxidation and cumulation of lipids in liver tissue and whether stimuli exist for lipid peroxidation *in vivo* was studied in white mice (23-27 g), albino rats (180-240 g) and in human patients with hepatic lesions. Estimation of conjugated dienes and lipid content was made following selected physiological conditioning: starvation, liver regeneration and fat load consisting of olive oil (8 ml/kg, intragastrically) and after administration of 50% ethanol (5 ml/kg, intragastrically) and carbon tetrachloride (2 ml/kg, i.p.). Olive oil increased depot lipid from 0.60 μEq of conjugated dienes at 1 hr to 0.83 μEq at 3 hr post administration; ethanol (0.63 to 1.14 μEq) and CCl_4 (0.56 to 1.00 μEq) also increased depot lipid. Starvation and regeneration enhanced liver peroxidation with a simultaneous increase in liver lipid concentration. Following fat load, the increase of depot fat is believed to induce enhanced liver peroxidation, whereas hepatotoxic agents and pathological states impair lipid metabolism of the cell which gives rise to lipid cumulation.

5992 LIVER DAMAGE AND LIPID METABOLISM: II. BIOSYNTHESIS OF CHOLESTEROL, PHOSPHOLIPIDS AND GLYCERIDES IN THE LIVER IN EXPERIMENTAL CHOLESTASIS IN RATS. *(Ger.)*

Kattermann, R. (Med. Clin. U. Gottingen, Germany) and W. V. Reimold. *Acta Hepatosplen* 17(2): 75-84, 1970.

Biochemical (cholesterol, glyceride, phosphatide) determinations were made in the liver of Wistar rats with experimentally-induced cholestasis. The incorporation of 2-^{14}C-acetate into the lipid fractions was increased compared with the controls (radioactivity total lipids 90.6, cholesterol 25.3, glycerides 25.4, phosphatides 35.2; specific activity 2.00, 11.00, 3.65, 1.29, resp.) at all stages of the investigation (24, 48, 72, 144 hr). Cholesterol radioactivity (393.4) and specific activity (168) increase particularly at 72 hr, and parallel with the accelerated synthesis, net increase occurred in liver cholesterol concentration (2.7 to 3.5 mg). The phosphatide and glyceride concentrations decreased and remained unchanged, during cholestasis. An increase of synthetic processes seemingly occurs in the liver in experimental cholestasis.

5993 THE INFLUENCE OF ATP-Spofa ON THE FATTY INFILTRATION OF THE LIVER DUE TO CARDIOPATHOGENIC DIET. *(E.)*

Lazarova, Z. (Fac. Pharm., Komensky U. Bratislava, Czechoslovakia) and F. Inczinger. *Folia Morph* 18(1):21-24, 1970

Histological and histochemical changes in the liver parenchyma of 30 rats, (3 groups receiving (i) cardiopathogenic diet, (ii) cardiopathogenic diet and ATP (0.12 mg/200 g), (iii) normal control diet), kept on a cardiopathogenic diet in order to induce an experimental cardiomyofibrosis, were studied in order to explain the metabolic changes of the liver lipid. A marked fatty infiltration of the liver was found in the majority of cases (8 rats) in the group fed on a cardiopathogenic diet. The fat was accumulated mainly in the superficial area of the cell plasma in small droplets and deposited to the extent of 1/3 of the lobulus around the vena centralis. An ATP supplemented diet led to a histologically normal liver in 9 cases. ATP appears to have a favorable influence on the metabolism of liver cells where it inhibits the fatty infiltration of the liver.

5994 EFFECT OF BASIC CUPRIC ACETATE ON THE BIOCHEMICAL CHANGES IN THE LIVER OF THE RAT FED CARCINOGENIC AMINOAZO DYE: II. ACTIVITY AND ISOZYME PATTERN OF LACTATE DEHYDROGENASE. *(E.)*

Yamane, Y. (Fac. Pharm. Sci., U. Chiba, Japan), K. Sakai, M. Hayashi, M. Matsuzaki and A. Hanaki. *Chem Pharm Bull* 18(5):1050-1052, 1970.

Four groups of Wistar rats (40 females) were used t study changes in the activity and isozyme pattern of LDH in the liver. Group I received .09% 4-dimethylaminoazobenzene, Group II received .5% basic cupric acetate hexahydrate, Group III received the above compounds combined in a maize diet, and Group IV received a maize diet alone as control). Analysis was made by liver homogenate preparation and supernatant enzyme assay. Groups II and III maintained a fairly high (> 10 x 10^4 units) level of LDH activity during the experiment. Group I, while showing a comparable level to the control initially, dropped (6 x 10^4 units) after 6 weeks. Since LDH activity did not decrease in the group of rats fed cupric acetate with the dyes, a role of copper may be to recover LDH activity that was reduced by the administration of 4-dimethylaminoazobenzene. The main component of LDH isozyme in the rat liver was LDH$_5$ fraction. When 2% homogenate was applied to the electrophoretic separation, only LDH$_5$ component was detected; with 10% homogenate, LDH$_4$ as well as LDH$_5$ appeared. The administration of cupric acetate with and without dimethylaminoazobenzene did not change the isozyme pattern observed in the control, while dimethylaminozaobenzene alone affected the isozyme pattern. Hence, the administration of cupric acetate repressed the change of the LDH isozyme pattern in the course of carcinogenesis in the liver of the rats fed dimethylaminoazobenzene. LDH$_3$ fraction was newly found in Group I after 11 weeks from the start; its appearance may be related to the induction of hepatic carcinoma by the feeding of dimethylaminoazobenzene.

5995 VARIATIONS IN AMINO ACIDS DURING 20 ACUTE LIVER ATROPHIES. *(Fr.)* Lemonnier, F. (Hosp. St. Antoine, Paris, France), P. Hadchouel, C. Charpentier and J. Caroli. *Rev Medicochir Mal Foie* 5(1):13-22, 1970.

Changes in blood and urine amino acid levels in acute hepatitis were studied in 20 patients (6 with subacute viral hepatitis, 13 with acute viral hepatitis, with toxic hepatitis) using electrochromatography nd the Beckman 120B autoanalyzer. In 18 patients rinary amino acids were increased; in 80 to 95% of he cases glutamic acid, lysine, histidine, tyrosine, thanolamine and glutamine were increased 5 to 8 imes their normal values. Alpha-alanine, methionine, erine and glycine were increased 3 to 4 times normal n 50 to 65% of the cases, and proline, valine and eucine-isoleucine were increased in 5 to 20% of the ases. Urinary phenolic acid levels were increased n 65 to 85% of the patients. Methionine, tyrosine nd ethanolamine levels in the blood were increased n 60 to 85% of the cases.

LIVER AND BILIARY TRACT

Acute Nonviral Hepatitis and Hepatic Injury

6054 ULTRASTRUCTURAL CHANGES IN HEPATIC PARENCHYMA IN SPLENOMEGALY AND HYPOPROTHROMBINEMIA. *(Ger.)* Leuschner, U. (Med. Clin., Policlin., Wesfalischen Wilhelms U., Munster, Germany), G. Manitz and H. Themann. *Z Gastroent* 8(2):96-108, 1970.

Ultrastructural changes in hepatic parenchyma of 2 patients (female) with hypoprothrombinemia, splenomegaly and a prehepatic block were studied by electron microscopy. Clinical and light microscopic examination revealed no evidence of liver damage; however, mitochondrial swelling, loss of mitochondrial matrix, vesicular transformation and reduction of the endoplasmic reticulum, and glycogen loss were all demonstrated with the electron microscope. The malformed mitochondria were smaller than normal, though with normal paracrystilline enclosure. Ribosomes in the membranes of the endoplasmic reticulum were also decreased. Liver damage was probably a consequence of an altered portal circulation, although changes in the fine tissue may also be due to toxic or allergic damage by the enlarged spleen. The hypoprothrombinemia may result from intracellular disturbance in synthesis and is an early indication of liver damage.

6055 ATTEMPT TO ESTABLISH A PROGNOSIS BASED ON HISTOLOGY IN SEVERE ACUTE HEPATITIS. *(Fr.)* Scotto, J. (Hosp. St. Antoine, Paris, France), A. Lageron and J. Caroli. *Ann Anat Path* 15(1):105-114, 1970.

The amount of steatosis in liver biopsy specimens from 12 patients with severe acute hepatitis was measured by histochemical, histoenzymological, and ultrastructural methods to assess its possible prognostic value. In all cases there was an increase in alkaline phosphatase aminopeptidases, and in the negativity of phosphorylases of canalicular adenosine-triphosphates, glutamic dehydrogenase, monoamine oxidase and dihydroorotate dehydrogenase. Normal glycogen content (9 patients), steatosis (6 patients), increased biliary stasis (4 patients), and diminution or absence of pentose pathways (7 patients), of the Krebs cycle (9 patients) and of glucose-6-phosphatase (8 patients) were found. Anerobic glycolysis was preserved (7 patients) and a hiatus between nuclear and cytoplasmic RNA was found (5 patients). In 2 patients who had 2 or 3 biopsies taken, there was considerable steatosis which led to morphological changes which were interpreted as cell regeneration and confirmed by electron microscopy. General nucleolar hypertrophy with the cytoplasm as the focus of degenerative lesions was observed. Steatosis is seemingly related to cell regeneration in the liver.

6056 DRUG METABOLISM IN ETHIONINE INDUCED FATTY LIVER. *(E.)* Ariyoshi, T. (Fac. Pharm. Sci. Nagasaki, Japan) and E. Takabatake. *Life Sci* 9(7):37 377, 1970.

The metabolic effects of ethionine on hepatic lipids, cytochrome P_{450} and b_5, and drug-metabolizing enzyme activities were compared with the effects of ethanol or phenobarbital in female Wistar rats. Ethionine in 0.9% saline (25 mg/ml) was injected i.p. into rats in three divided doses within 2 hr for a total dose of 750 mg/kg. Ethanol was given p.o. at a dose of 5.0 g/25 ml/kg 16 hr before sacrifice and phenobarbital was injected i.p. at 80 mg/2 ml/kg 24 hr before sacrifice. In combined drug treatments, ethionine was given 2 hr before administration of ethanol or phenobarbital. Animals were sacrificed at 6, 12, 24, 48, 72, and 120 hr after the last injection of ethionine, and livers from each group were pooled, homogenized with 0.25 M sucrose and 0.001 M EDTA, homogenates were centrifuged and microsomal pellets were prepare for spectroscopic analysis. In the ethionine-injecte animals, the level of liver triglycerides rose from a pre-injection level of 6.8 ± 2.8 mg/g to 12.3 ± 2. mg/g 6 hr after injection, and reached a maximum lev of 21.8 ± 4.5 mg/g 48 hr after injection. The conte of microsomal protein decreased from a baseline leve of 18.6 ± 0.4 mg/g to a minimum of 13.6 ± 0.2 mg/g 2 hr after injection and remained depressed at 16.9 ±

2 mg/g at 120 hr post-injection. Ethionine treat-
nt reduced the spectral activities (absorbence ·
$^{-3}$/mg of protein) of b_5 and P_{450} from preinjection
vels of 48.0 ± 0.7 and 33.3 ± 0.8, resp., to
2 ± 1.5 and 15.4 ± 1.3 in 24 hr. Aniline hydroxy-
e and aminopyrine demethylase activities (µmoles/
min) decreased from baseline levels of 0.34 ± 0.02
3.50 ± 0.20, resp., to 0.27 ± 0.01 and 2.92 ± 0.25
6 hr. The effect of phenobarbital or ethanol to
rease the contents of the cytochromes or to change
spectral characteristics of the drugs was com-
tely abolished in rats pretreated with ethionine.
vever, the effect of ethanol to stimulate aniline
roxylase was not affected by ethionine. The
etic analysis of the effect of ethionine pretreat-
t on ethanol or phenobarbital treatment showed that
ionine enhanced K_m values in all groups and also
$_x$ for aniline hydroxylase, but blocked the increase
V_{max} for aminopyrine demethylase by phenobarbital.

7 INFLUENCE OF AGE AND SEX ON HEPATIC LESIONS
INDUCED BY CHEMICAL CARCINOGENS: INGESTION
N-4-(4'-FLUOROBIPHENYL)ACETAMIDE BY BUFFALO STRAIN
S. *(E.)* Stromberg, K. (Natl. Cancer Inst., Beth-
a, Md.) and M. D. Reuber. *J Nat Cancer Inst*
5):1047-1054, 1970.

influence of age and sex on the development of
atic lesions was studied in Buffalo rats follow-
N-4-(4'-fluorobiphenyl)acetamide ingestion (0,04%
diet, *ad libitum*) for 36 weeks. The incidence of
cinomas decreased and the degree of differentiation
reased with age in the animals (particularly notice-
e in males). The average number of tumors/liver
average tumor diameter (cm) decreased steadily (in
es at 4 weeks 7-8 and 3.0, at 12 weeks 2-3 and 2.0,
24 weeks 1-2 and 1.5, and at 52 weeks 0-1 and 0.5,
in females at 4 weeks 0-1 and 2.0, at 12 weeks
and 2.5, at 24 weeks 0-1 and 0.5, and at 52 weeks
nd 0), indicating that for any one age group males
e more susceptible to the carcinogen than females.

8 ULTRASTRUCTURAL AND BIOCHEMICAL CHANGES
IN THE LIVER OF MONOCROTALINE INTOXICATED
KENS. *(E.)* Allen, J. R. (Dept. Path., U. Wiscon-
Madison), L. A. Carstens and D. H. Norback.
c Appl Pharmacol 16(3):800-806, 1970.

astructural morphology (gross, light and electron
oscopic observations) and biochemistry (DNA, RNA
nitrogen content) of livers were examined in
kens 10 weeks after a single dose (20 mg p.o.)
onocrotaline. The livers of the treated chickens
e small (3.1g compared to a control mean of 16.6g)
irregular with disrupted architecture, and 75%
he hepatic cells were large and pale with small
otic nuclei. Four types of hepatocytes were ap-
nt in the intoxicated livers: some were morpho-
cally similar to normal liver cells; a predominate
er were large containing glycogen granules, ves-
s, cisternae, mitochondria and lysosomes; the
rd type were slightly smaller with more abundant
plasmic organelles, less apparent matrix and
al mitochondria, lysosomes, microbodies and nu-
; and the fourth type were greatly degenerated
electron dense. Quantitatively (mg/100 mg liver)
DNA (0.011), RNA (0.33) and nitrogen (2.03) levels were reduced from normal levels (0.40, 0.70 and 3.07, resp.).

6059 HEPATOCELLULAR CHANGES ASSOCIATED WITH ALLYLISOPROPYLACETAMIDE-INDUCED HEPATIC PORPHYRIA IN RATS. *(E.)* Moses, H. L. (Vanderbilt U. Sch. Med., Nashville, Tenn.), J. A. Stein and D. P. Tschudy. *Lab Invest* 22(5):432-442, 1970.

The hepatocellular changes associated with experimental porphyria (allylisopropylacetamide-induced) a and the effects of adrenalectomy and protein synthesis inhibitors on the changes were examined biochemically (enzyme assays of δ-aminolevulinic acid synthetase, sulfobromophthalein conjugating enzyme and tyrosine transaminase) and morphologically (gross, light microscopic and electron microscopic observations) in rats. After a single dose of allylisopropylacetamide (AIA, 300 to 400 mg/kg s.c.) δ-aminolevulinic acid synthetase activity (mµmole/g liver/hr) increased (25 to 160), sulfobromophthalein conjugating enzyme activity (mg/g liver/5 min) increased (10 to 12 after 5 hr) and tyrosine transaminase activity (change in absorption/U/min) increased (1.0 to 1.8 after 4 hr); after multiple doses of AIA, the response of δ-aminolevulinic acid synthetase was much greater (25 to 265 after a second dose). Liver size (g/100g body weight) increased in the AIA group from a control level (4.11) to 4.91 after a single dose and to 6.08 after 3 daily doses (adrenalectomized animals exhibited no significant increase) and this increase could be accounted for by increased parenchymal cell size accompanied by increased nuclear and nucleolar size. Electron microscopy revealed glycogen depletion, hypertrophy of the smooth endoplasmic reticulum, and dense material in Golgi-associated vesicles in the livers of the treated group, and livers of adrenalectomized animals showed none of the hypertrophy. Administration of puromycin (100 mg/kg i.p.) or actinomycin D (1.5 mg/kg s.c.) with AIA prevented the hepatocellular changes and the overall morphologic effect was similar to that of puromycin or actinomycin D alone.

6060 INFLUENCE OF OROTIC ACID ON LIVER TUMORIGENESIS IN RATS INGESTING ETHIONINE, *N*-2-FLUORENYLACETAMIDE, AND 3'-METHYL-DIMETHYLAMINOAZOBENZENE. *(E.)* Sidransky, H. (U. Pittsburgh Sch. Med., Pa.) and E. Verney. *J Nat Cancer Inst* 44(5):1201-1215, 1970.

Diets containing orotic acid were fed to male and female Sprague-Dawley rats either before or during the feeding of diets containing ethionine, *N*-2-fluorenylacetamide (2-FAA), or 3'-methyl-4-dimethylaminoazobenzene (3'-Me-DAB). In the orotic acid and ethionine experiments, the highest incidence (74%) of liver carcinoma occurred in rats fed ethionine alone. Rats fed the diet containing orotic acid for 3 weeks and then shifted to ethionine alone or with orotic acid had a much lower incidence of liver cancer (44 and 31%, resp.). Addition of adenine sulfate to the diet containing ethionine alone led to a 63% incidence, while the addition of adenine to the ethionine plus orotic acid diet led to an incidence of 77%. No liver tumors were found in rats fed the diet containing orotic acid alone or adenine sulfate alone. In orotic acid and 2-FAA experiments, the heaviest livers were found in animals fed the 2-FAA plus adenine sulfate diet with a 95% incidence of liver cancers. An 87% incidence occurred with the 2-FAA diet alone. In rats fed orotic acid for 3 weeks and then shifted to 2-FAA alone, to 2-FAA and orotic acid, and to 2-FAA, orotic acid, and adenine sulfate, the incidence of liver cancers was 58 to 65%. In animals shifted to 2-FAA plus orotic acid, increases in hepatic lipid persisted for 2 and 5 weeks (17.7 and 16.4%, resp.) and then decreased after 9 and 13 weeks (9.1 to 9.5%). In the animals shifted to 2-FAA alone, the hepatic lipids dropped from 7.0-8.6% after 2, 5, and 9 weeks, to 4.7% after 13 weeks. In the orotic acid and 3'-Me-DAB experiments, male rats fed diets with orotic acid before or during the feeding of 3'-Me-DAB developed the same high incidence of liver cancers as rats fed 3'-Me-DAB alone (91 to 100%).

6061 INCREASED ETHANOL TOXICITY IN OLD RATS: CHANGES IN LD50, *IN VIVO* AND *IN VITRO* METABOLISM, AND LIVER ALCOHOL DEHYDROGENASE ACTIVITY. *(E.)* Wiberg, G.S. (Res. Lab., Food Drug Directorate, Ottawa, Canada), H.L. Trenholm and B.B. Coldwell. *Toxic Appl Pharmacol* 16(3):718-727, 1970.

The acute lethal dose of ethanol in young (about 100 days) and old (10-12 months old) male rats was studied to learn whether age altered acute ethanol toxicity. The acute (24 hr) LD_{50} of ethanol was determined in both groups, the value being 10.6 g/kg in young rats and 7.06 g/kg in the old rats after p.o. administration. Blood and brain decay profiles for ethanol and acetaldehyde were also investigated to compare relative rates of metabolism. The blood ethanol levels, although initially higher in young rats, also declined more rapidly. The rate of metabolism of brain ethanol was slower in the older than in young animals. Metabolism of ethanol in liver slices of young rats was 871 μg/g/hr as compared to 531 μg/g/hr in the older group. Old rats seemingly are significantly more susceptible to acute ethanol toxicity than young rats.

6062 ALTERATION OF ALCOHOL-DEHYDROGENASE ACTIVITY FOLLOWING PROTEIN DEFICIENCY AND ETHANOL. *(Ger.)* Bode, C. (Med. Clin., U. Marburg, Germany), H. Goebell and M. Stahler. *Z Ges Exp Med* 152(2): 111-124, 1970.

The effect of alcohol on liver alcohol dehydrogenase activity was studied in 300 male Wistar rats fed normal diets (24% protein) or protein-poor diets (0.5 or 5% protein), with or without ethanol (15%) in their drinking water. In control animals ADH-activity increased with age (1.83 to 3.03/mg liver wt at 1 week and 18 weeks, resp.). While ethanol administration brought about an initial increase in ADH levels in rats fed either diet, after 3 weeks animals maintained on the standard diet exhibited normal (no ethanol) enzyme levels. In animals fed the 5% protein diet, ADH-activity fell between the 1st and 12th weeks but increased in the 18th week, while those fed the 0.5% protein diet had even lower ADH activities (15% of normal after 3 weeks), which later returned to normal Comparison of alcohol concentrations in the blood of rats fed standard and protein-poor diets, revealed a maximal concentration at 2 hr of 34 mM in the former and almost twice that in the latter. This effect continued for 12 hr after feeding in the low-protein group and fell to fasting level in the normal. This decrease in ADH-activity may explain the unfavorable effect of protein deficiency in liver damage caused by alcohol.

LIVER AND BILIARY TRACT

Cirrhosis

112 GASTROENTERIC CLEARANCE OF ALBUMIN IN LIVER CIRRHOSIS: RELATIVE PROTEIN-LOSING
ASTROENTEROPATHY. *(E.)* Takada, A. (Sch. Med.,
anazawa U., Japan), K. Kobayashi and J. Takeuchi.
igestion 3(3):154-164, 1970.

urn-over changes and gastroenteric clearance of
.bumin was studied in 23 patients with liver dis-
ises (4 acute hepatitis, 5 chronic hepatitis, 14
.ver cirrhosis). To explore the role of gastro-
iteric degradation as an extrahepatic factor re-
ited to hypoalbuminemia development. Albumin
isses into stools (g/day) were 2.02 ± 0.14 in con-
rols, 2.03 ± 0.46 in acute hepatitis, 2.14 ± 0.33
chronic hepatitis, and 2.44 ± 1.26 in liver
rrhosis, resp.; differences were not statistically
gnificant. Serum loss into stools was significantly
creased in liver cirrhosis compared with those in
ntrols (65.7 ± 14.4 ml vs 39.0 ± 4.8 ml, $p<0.01$).
rcentages of albumin degradation in gastrointesti-
l tract to total catabolism (degradation ratio)
re significantly higher in liver cirrhosis com-
red with controls (32.4 ± 10.4 vs 16.9 ± 3.0,
0.01). Changes in loss of serum and fractions of
bumin catabolism in acute and chronic hepatitis
re not statistically significant from control
lues. In cirrhotic patients, all values concerning
stroenteric clearance were significantly higher in
tients with signs of portal hypertension, than in
ose without these signs ($p<0.05$ albumin loss, $p<0.01$ in serum loss and degradation ratio). Significant correlations between portal pressure and albumin excretion into stools and between serum albumin levels and serum loss into stool or gastroenteric ratio were also observed. Albumin loss into stool seemingly was relatively increased in liver cirrhosis; this was caused by the impairment of the control mechanism of albumin degradation in the gastrointestinal tract.

6113 ENDOSCOPIC STUDY OF THE CIRRHOTIC PATIENT BEFORE AND FOLLOWING PORTACAVAL SHUNT FOR BLEEDING VARICES. *(E.)* Dagradi, A. E. (U. California Los Angeles Sch. Med.), S. J. Stempien and D. T. D. Tan. *Amer J Gastroent* 53(5):425-436, 1970.

Endoscopic findings were evaluated in 50 cirrhotic patients before and following portacaval shunt for bleeding varices (32 esophageal and 18 gastric fundal). When surgical portal decompression was adequate (40 patients), varices still exist, but were small in caliber and extent. A similar but less pronounced improvement in endoscopic appearance of varices was observed when shunt was patent (6 patients) but less than adequate (compromised stoma) while a marked increase in extent and size of large varices was observed when shunt was occluded (4 patients). These categories conform well with findings established by splenic manometry and splenoportal venography. Following postcaval shunt, varices increased to some degree in caliber and extent (did not assume preshunt conditions) and when the shunt became occluded, portal venous pressure increased and large varices resulted. The mortality rate was 100%, survival rate was 8-10 days following surgery, and re-bleeding from ruptured varices was the primary cause of death. Re-bleeding from varices did not result in patients having a less-than-adequate shunt. Bleeding from peptic ulcer disease tripled in frequency while bleeding from hemorrhagic erosive gastritis quadrupled (from one to four patients) in frequency in postshunt patients. The protective value of successful portacaval shunt against re-bleeding from esophageal varices is apparent, but the procedure does not insure patients against future episodes of upper gastrointestinal bleeding from other sources.

6114 IRON ABSORPTION AFTER PORTCAVAL SHUNT OPERATIONS.

(E.) Chernelch, M. J. (Donnor Lab., Lawrence Radiat. Lab., U. California, Berkeley), H. S. Winchell, T. W. Sargent, M. Pollycove and C. J. Shkurkin. *Lawrence Radiat Lab Semiann Rep Biol Med* (UCRL 19420):25-29, 1970.

Intestinal iron absorption was studied in 15 cirrhotic patients, 7 of whom had undergone end-to-side portacaval shunting for portal hypertension, 5 weeks to 5.5 yr prior to the absorption studies. In 2 patients, studies were performed both before and after the operation. In addition, iron absorption was studied in 4 dogs both before and 6 weeks and 4 months after end-to-side portacaval shunting. Intestinal iron absorption was subnormal for both groups of patients. There was no increase in intestinal iron absorption following portacaval shunting in the cirrhotic patients. Intestinal iron absorption decreased following the shunting operation in the 2 patients studied before and after surgery. In the 4 dogs, iron absorption increased following the shunting operation, and it continued to increase during the 6-week to 4-month interval. At the 4-month interval, serum iron concentrations and plasma radioiron clearance rates had returned to approximately normal preoperative levels; 2 dogs had hematocrit values comparable to preoperative levels, and the other 2 had diminished venous hematocrit levels. End-to-side portacaval shunting in the dogs seemingly results in increased portal venous pressure, whereas in the cirrhotic patients, portal venous pressure was decreased which may have had an effect on the decreased iron absorption.

6115 SERUM IMMUNOGLOBULIN STUDIES IN CHRONIC HEPATITIS AND CIRRHOSIS.

(Fr.) Pirotte, J. (Med. Dept., U. Liege, Belgium), L. Ruyters and J. Salmon. *Acta Gastroent Belg* 33(1):9-18, 1970.

Serum immunoglobin (IgA, IgM, IgG) levels were measured in 100 normal, 40 cirrhotic and 30 patients with chronic hepatitis (12 active, 18 persistent) using antibody-agar plates. Normal controls had IgA, IgG, and IgM levels (in mg%) of 320.30, 104.09, and 957.02, resp. Cirrhotic patients (whether alcoholic or post-hepatic) exhibited elevated IgA levels, with the increase depending on the severity of the disease (423.85 to 610.56). Patients with active chronic hepatitis showed a marked increase in IgG (2313.75) and in IgM (435.42) while patients with chronic persistent hepatitis had levels of 1441 and 124.06, resp. The use of immunoglobin pattern does not appear to be indicated as a diagnostic tool for cirrhosis.

6116 HISTOMETRICAL ANALYSIS OF HEPATIC PARENCHYMA IN NORMAL AND CIRRHOTIC LIVERS.

(E.) Kaneda, M. (Tohoku U. Sch. Med., Japan) and T. Takahashi. *Tohoku J Exp Med* 100(3):201-225, 1970.

Quantitative analysis of the intranodular structure in liver cirrhosis was studied in 194 biopsy specimens wit histometrical methods. Capillarization per unit volume of liver cells in cirrhosis was much reduced in comparison with the normal liver and this was attributed to enormous thickening or hypertrophy of liver cell plates. Hypertrophy of cell plates in cirrhosis apparently was due either to swelling of individual cells or to cell multiplication. A perverted hyperplasia was evident and was assumed in behavior of liver cells in liver cirrhosis, which was found neither in normal liver nor in any stage of hepatitis. Nodule formation in liver cirrhosis appears to be based on a process which is different from simple regeneration of liver cells. Histometrical results were also of diagnostic value in discrimination of liver cirrhosis from other liver conditions particularly on small biopsy specimens, where cirrhotic nodules could not be always identified.

56 BIOASSAY EVIDENCE OF ABNORMAL SECRETIN-
LIKE ACTIVITY IN TUMOR AND BLOOD IN CASES
"CHOLERAIC DIARRHEA." *(E.)* Cleator, I.G.M.
estern Gen. Hosp., Edinburgh, Scotland), C.G.
mson, W. Sircus and M. Coombes. *Gut* 11(3):206-
, 1970.

-assay of tumor extracts and plasma from patients
h choleraic diarrhea are described, in addition
the influence of tumor extracts upon water and
transport across intestinal mucosa of the dog
cat. The first patient showed choleretic and
retin-like activity in extract of pancreatic
et cell tumor and gastrin-like activity in plasma,
le a second patient was found to have both secretin
gastrin-like activity in plasma, as well as
leretic activity. Extracts of tumor from the
st case of choleraic diarrhea caused a secretion
juice from otherwise unstimulated pancreas in
cat but not in the dog. Since the volume of
ce provoked from the unstimulated pancreas of
h animals by tumor extract was small, the pancreas
primed with an infusion of secretin (9.1 units
ts secretin/kg body weight/hr for the cat and
units/kg body weight/hr for the dog). Extract
tumor from the first case then caused augmentation
pancreatic output with secretin-like characteristics
both dog and cat. Response was rapid in onset and
short duration. Plasma from a second patient pro-
ed a rise in volume of pancreatic secretion in the
, while plasma from the same patient had no effect
pancreatic secretion in the cat until after
ming with secretin. During priming infusion
secretin in the dog, injection of extract of
or from the first patient and plasma from the
ond patient, there was an increased bilirubin
centration without change in volume of secreted
e. I.V. injection of various extracts did not
ect transport of water, sodium, chloride, or
assium through mucosa of Thiry-Vella intestinal
ps in perfusion experiments. Part of the pro-
e, watery electrolytic diarrhea of 'pancreatic
lera' syndrome associated with peptide-secreting
noma of pancreas seemingly is a reflection of
essive secretin production, as well as gastrin,
possibly also of a choleretic agent.

7 ANTITOXIC IMMUNITY IN EXPERIMENTAL CHOLERA:
OBSERVATIONS WITH PURIFIED ANTIGENS AND THE
TED ILEAL LOOP MODEL. *(E.)* Finkelstein, R. A.
Texas Southwestern Med. Sch., Dallas). *Infect*
n 1(5):464-467, 1970.

antitoxic immunity from purified choleragen
lera exo-enterotoxin) and choleragenoid (natural
id) in experimental cholera in rabbits was tested
ntraintestinal (ligated ileal loops) challenge
a variety of strains of living *cholera vibrios*
oximately 10^6 viable cells/challenge of SP35,
, NIH35, 26-3 or choleragen). Overall, the im-
zed rabbits resisted all the challenges without
gnificant antibacterial antibody response and the
gens were ineffective in protecting mice against
ng vibrios in mucin, although the immunized rab-
did develop high titers of circulating hemaglu-
ting antibody against chicken erythrocytes sensi-
d with choleragen and choleragenoid. Fluid outpouring (ml/cm ileal loop) decreased after challenge with SP35 (0.73 to 0.33), 569 (1.36 to 0.54), NIH41 (1.22 to 0.13), NIH35 (1.36 to 0.20), 26-3, (1.30 to 0.36) and choleragen (2.15 to 1.43), and the existence of only 1 serological type of cholera exo-enterotoxin is suggested.

6158 REVERSAL OF CHOLERA EXOTOXIN-INDUCED JEJUNAL SECRETION BY CYCLOHEXIMIDE. *(E.)* Harper, D. T., Jr. (Johns Hopkins Sch. Med., Baltimore, Md.), J. H. Yardley and T. R. Hendrix. *Johns Hopkins Med J* 126(5):258-266, 1970.

Thirteen male New Zealand white rabbits with Thiry-Vella intestinal loops injected with cholera exotoxin were used to determine if cycloheximide would reverse jejunal secretions induced by exotoxin. Cycloheximide (20 mg/kg i.v.) was given to 6 of these rabbits 2 hr after the exotoxin, nutrient broth was instilled instead of exotoxin in 5 control rabbits, broth was followed 2 hr later by cycloheximide in 5 others, and cycloheximide was given 1 hr before broth in 6 other rabbits. All loops were perfused following instillation for 9 hr with recirculating Ringer's lactate containing 0.3 mM phenol red. The perfusate was absorbed in all control loops at 0.25 cc/cm loop length. Both loops in animals receiving cycloheximide absorbed greater amounts (0.40 and 0.66 cc/cm) with more rapid concentration of phenol red during 4 1/2 hr after cycloheximide administrations. Loops stimulated with cholera exotoxin progressively diluted the phenol red with a final secretion of 2.27 cc/cm. Serial biopsies showed an absence of mitosis and crypt epithelial cell cytoplasmic vacuolization. Cycloheximide seemingly reverses established cholera exotoxin-induced fluid production in rabbit jejunal loops and increases net absorption from control loops and both effects may be attributed to the inhibition of blood to lumen flux.

6203 LIPOFUSCINOSIS OF INTRAABDOMINAL LYMPH NODES. *(Sw.)* Zettergren, L. (Path. Inst., U. Goteborg, Sweden). *Nord Med* 83(22):697-699, 1970.

6204 PSYCHOSOMATIC ASPECTS OF GASTROENTEROLOGY. *(Dut.)* Pennoit, H. (Acad. Hosp., Ghent, Belgium). *T Geneesk* 26(9):455-460, 1970.

6205 SURGICAL MANAGEMENT OF GASTROSCHISIS. *(E.)* Bryant, L. R. (U. Kentucky Med. Ctr., Lexington), R. A. Beargie, R. H. Segnitz, J. K. Trinkle and W. O. Griffen, Jr. *Ann Surg* 171(5):752-763, 1970.

6206 ABDOMINAL DRAINS: THEIR ROLE AS A SOURCE OF INFECTION FOLLOWING SPLENECTOMY. *(E.)* Cerise, E. J. (Tulane U. Med. Sch., New Orleans, La.), W. A. Pierce and D. L. Diamond. *Ann Surg* 171(5):764-769, 1970.

6207 CHYLOUS ASCITES SECONDARY TO INGUINAL HERNIA IN AN INFANT. *(E.)* Santoro, E. (St. Vincent Hosp., Med. Ctr., New York, N. Y.) and A. Shaw. *Amer J Surg* 119(5):579-580, 1970.

GENERAL

6208 MANAGEMENT OF CONGENITAL ATRESIA OF THE INTESTINE. *(E.)* Santulli, T. V. (Coll. Physicians Surgeons, Columbia U., New York, N. Y.), C. C. Chen and J. N. Schullinger. *Amer J Surg* 119(5):542-547, 1970.

6209 MESENTERIC CYSTS: A REVIEW AND REPORT OF FOUR CASES. *(E.)* Sanchez, R. E. (Wadsworth Hosp., VA Ctr., Los Angeles, Calif.), H. E. Gordon and E. Passaro, Jr. *Amer Surg* 36(6):378-382, 1970.

6210 FIVE YEAR HISTORY OF SURGICALLY TREATED ABDOMINAL AORTIC ANEURYSMS. *(E.)* Gardner, R. J. (West Virginia U. Med. Ctr., Morgantown), J. R. Lancaster, T. J. Tarnay, H. E. Warden and R. A. Currie. *Surg Gynec Obstet* 130(6):981-987, 1970.

6211 INBORN ERRORS OF MUCOPOLYSACCHARIDE METABOLISM. *(E.)* Neufeld, E. F. (Natl. Inst. Arthritis Metab. Dis., Bethesda, Md.) and J. C. Fratantoni. *Science* 169(3941):141-146, 1970.

6212 RECURRENT ABDOMINAL PAIN IN CHILDHOOD. *(E.)* Stone, R. T. (Child. Hosp. Philadelphia, Pa.) and G. J. Barbera. *Pediatrics* 45(5):732-738, 1970.

6213 BUDD-CHIARI SYNDROME CAUSED BY A WEB AS A RESULT OF VISCERAL THROMBOPHLEBITIS MIGRANS: REPORT OF A CASE. *(E.)* Volpe, J. A. (Letterman Gen. Hosp., San Francisco, Calif.), J. J. Bergin and E. L. Overholt. *Amer J Dig Dis* 15(5):469-476, 1970.

6214 EFFECTS OF BROCRESINE ON ZOLLINGER-ELLISON SYNDROME: REPORT OF 2 CASES. *(E.)* Levine, R. J. (Yale U. Sch. Med., New Have, Conn.), A. B. Vaidya, D. J. C. Shearman, S. M. Levine and T. Hersh. *Amer J Dig Dis* 15(5):477-484, 1970.

6215 INCIDENCE OF PROTEIN DEFICIENCY IN RELATION TO DIFFERENT DIETS IN INDIA. *(E.)* Sukhatme, P. V. (Food Agric. Org., Rome, Italy). *Brit J Nutr* 24(2):477-487, 1970.

6216 A CASE OF ABDOMINAL SITUS INVERSUS WITH NON-ROTATION AND CHOLELITHIASIS. *(E.)* Wike, C. C. (Med. Coll. Georgia, Augusta), B. F. Caldwell and R. A. Parrish. *Amer Surg* 36(6):346-348, 1970.

6217 ASCITES. *(E.)* Friesen, J. E. (U. Toronto, Ontario, Canada). *Univ Toronto Med J* 47(4):131-134, 1970.

6218 CHYLOUS ASCITES: NEWER INSIGHTS AND MANY REMAINING ENIGMAS. *(E.)* Lesser, G. T. (Lenox Hill Hosp., New York, N. Y.), M. S. Bruno and K. Enselberg. *Arch Intern Med* 125(6):1073-1077, 1970.

6219 INTESTINAL BLEEDING IN INFANTS AND CHILDREN—SURGICAL VIEW. *(Ger.)* Popp, W. (Dist. Hosp. Karl Marx St., Germany) and G. Amelung. *Zbl Chir* 457-465, 1970.

6220 PHENOBARBITAL FOR NEONATAL JAUNDICE. *(E.)* Behrman, R. E. (U. Illinois Coll. Med., Chicago) and D. E. Fisher. *J Pediat* 76(6):945-948, 1970.

6221 IATROGENOUS ABDOMINAL ACTIVITIES. *(E.)* Cantor, M. O. (Detroit, Mich.). *J Abdom Surg* 12(6):84-91, 1970.

6222 AUTOIMMUNE DISEASES OF THE GASTROINTESTINAL TRACT AND LIVER. *(Ger.)* Warnatz, H. (U. Hosp. Erlangen-Nuremberg, Germany). *Med Welt* 21(22): 1025-1029, 1970.

6223 POSTOPERATIVE SERUM ENZYME CHANGES FOLLOWING ABDOMINAL SURGERY. *(Ger.)* Zelder, O. (Surg. U. Clin. Marburg, Germany). *Chirurg* 41(6): 278-280, 1970.

6224 FAT BALANCE STUDIES IN MARASMUS. *(E.)* Teotia, M. (K. G. Med. Coll., Lucknow, India), S. P. S. Teotia and N. L. Sharma. *Indian J Med Res* 57(12):2240-2245, 1969.

6225 COMPARISON OF THE RESULTS OF INTERNAL ILIAC AND UTERINE ARTERY LIGATION IN WERTHEIM HYSTERECTOMY AND PELVIC LYMPHADENECTOMY. *(E.)* Lash, A. F. (Stritch Med. Sch., Loyola U., Chicago, Ill.) and R. H. MacNorland. *Int Surg* 53(5):344-347, 1970.

6226 PRE- AND POSTJUNCTIONAL SUPERSENSITIVITY OF THE MESENTERIC ARTERY PREPARATION FROM NORMOTENSIVE AND HYPERTENSIVE RATS. *(E.)* Haeusler, G. (Dept. Exp. Med., Hoffman-La Roche Co., Basel, Switzerland) and W. Haefely. *Naunyn Schmiedeberg Arch Pharmakol* 266(1):18-33, 1970.

6227 MALNUTRITION IN INFANCY: CHANGES IN MUSCLE AND ADIPOSE TISSUE BEFORE AND AFTER REHABILITATION. *(E.)* Cheek, D. B. (Johns Hopkins Hosp Baltimore, Md.), D. E. Hill, A. Cordano and G. G. Graham. *Pediat Res* 4(2):135-144, 1970.

6228 THE RELATIONSHIP OF GALACTOSE-1-PHOSPHATE ACCUMULATION AND URIDYL TRANSFERASE ACTIVITY TO THE DIFFERENTIAL GALACTOSE TOXICITY IN MALE AN FEMALE CHICKS. *(E.)* Mayes, J. S. (U. Oklahoma Med. Ctr., Oklahoma City), L. R. Miller and F. K. Myers. *Biochem Biophys Res Commun* 39(4):661-665, 1970.

6229 CHILDHOOD ABDOMINAL LYMPHOMA IN ISRAEL. *(E* Hulu, N. (Tel Aviv U. Med. Sch., Israel), B. Ramot and W. Sheehan. *Isreal J Med Sci* 6(2):246-251, 1970.

230 PERSISTENCE OF AN *ESCHERICHIA COLI-SHIGELLA FLEXNERI* HYBRID IN THE INTESTINAL TRACT OF *ICACA MULATTA. (E.)* Wynne, E. S. (USAF Sch. Aero-pace Med., Brooks AFB, Texas), D. M. Henrikson and T. Daye, Jr. *App Microbiol* 19(5):731-733, 1970.

31 CHOLERA-LIKE SYNDROME AND PANCREATIC ISLET CELL TUMORS. *(E.)* Cerda, J. J. (U. ennsylvania Med. Sch., Philadelphia), E. C. affensperger and H. M. Rawnsley. *Med Clin N Amer* (3):567-575, 1970.

32 MESENTERIC ISCHEMIC DISEASE. *(E.)* Edwards, A. (St. Bartholomew's Hosp., London, gland). *St Bartholomews Hosp J* 78(5):161-167, 1970.

33 THE PROPHYLACTIC PORTACAVAL SHUNT: AN EXAMINATION OF "CLINICAL JUDGMENT." *(E.)* esnick, R. H. (Boston, Mass.). *Med Times* 98(6):93-3, 1970.

34 THE MANAGEMENT OF INTESTINAL OBSTRUCTION IN THE ADULT. *(E.)* Kirk, R. M. (Hampstead Gen. sp., England). *Ann Roy Coll Surg England* 46(3): 7-158, 1970.

35 MESENTERIC VENOUS THROMBOSIS ASSOCIATED WITH ORAL CONTRACEPTIVES. *(E.)* Civetta, J. M. SAF Med. Ctr., Keesler AFB, Miss.) and M. Kolodny. *stroenterology* 58(5):713-716, 1970.

36 MODE OF ACTION OF CEOLAT AND CEOLAT COMPOUNDS: A CLINICAL RADIOLOGICAL STUDY. *er.)* Lenhart, A. (no affil). *Z Ther* 8(3):142-148, 70.

37 SYMPTOMS OF DYSPEPSIA AND THE MANAGEMENT OF FUNCTIONAL DYSPEPSIA. *(Ger.)* Seewann, L. (Med. U. Clin. Graz, Austria) and R. Heschl. *in Med Wschr* 120(21):386-388, 1970.

38 CAUSES OF MASSIVE HEMORRHAGE OF UPPER GASTROINTESTINAL TRACT. *(Ger.)* Klems, H. eglitz Clin., Free U. Berlin, Germany) and R. ing. *Zbl Chir* 95(13):402-412, 1970.

39 PSEUDOMYXOMA PERITONEI THROUGH A BLUNT ABDOMINAL TRAUMA. *(Ger.)* Schwarz, R. ath. Anat. Inst. U. Graz, Germany). *Zbl Chir* (10):330-333, 1970.

40 THE ELIMINATION OF VARIOUS STEROID HORMONES, VANILLYLMANDELIC ACID AND LACTIC D IN NEWBORN INFANTS WITH DIABETIC MOTHERS. *(Ger.)* bylova, H. (Inst. Mother Child Care, Prague echoslovakia) and J. Herzmann. *Arch Kinderheilk* (3):282-291, 1970.

6241 PURIFIED Vi-ANTIGEN PREPARATIONS IN TYPHOID FEVER THERAPY. *(Rus.)* Shneider, V. P. (Vitebsk Med. Inst., USSR). *Sovet Med* 33(3):126-127, 1970.

6242 PROGRESS IN THERAPEUTIC GASTROENTEROLOGY-ORGANIC OR FUNCTIONAL. *(Fr.)* Geoffroy, H. (C. H. U. Reims, France), P. Coudoux, C. Maffioli, P. Chardon and C. Behar. *Maroc Med* 50(534):249-258, 1970.

6257 THE INCIDENCE AND CLINICAL PATTERN OF GIARDIASIS IN CHILDREN OF MADURAI. *(E.)* Krishnamurthy, K. A. (Madurai Med. Coll., India). *Indian Pract* 23(2):141-143, 1970.

6258 ACTION OF METRONIDAZOLE (FLAGYL) ON *GIARDIA INTESTINALIS*: A CYTOCHEMICAL STUDY. *(E.)* Mukherjea, A. K. (Sch. Trop. Med., Calcutta, India). *Indian Pract* 23(2):173-176, 1970.

6259 GASTROINTESTINAL PARASITES OF WILD FALLOW DEER (*DAMA DAMA* L.). *(E.)* Batty, A. F. (Epping, Essex, England) and D. I. Chapman. *J Helminth* 44(1):57-61, 1970.

6260 PERFORMANCE IN CHICKENS AND TURKEYS OF CHICKEN-ADAPTED *HETERAKIS GALLINARUM*. *(E.)* Lund, E. E. (Beltsville Parasit. Lab., Md.), A. M. Chute and S. L. Myers. *J Helminth* 44(1):97-106, 1970.

6261 A SHORT NOTE ON GIARDIASIS. *(E.)* Prakash, O. (All-India Inst. Med. Sci., New Delhi). *Indian Pract* 23(2):123-125, 1970.

6262 ADULT GIARDIASIS: INCIDENCE AND CLINICAL FEATURES. *(E.)* Antia, F. P. (B. Y. L. Nair Hosp., Bombay, India), H. G. Desai and A. V. Borkar. *Indian Pract* 23(2):127-129, 1970.

6263 GIARDIASIS IN CHILDREN: SYMPTOMATOLOGY. *(E.)* Nair, K. P. B. (Trichur, India). *Indian Pract* 23(2):145-154, 1970.

6264 GIARDIASIS IN RELATION TO DIARRHEAL DISORDERS IN CHILDREN. *(E.)* Mathai, N. M. (Med Coll. Hosp., Calicut, India). *Indian Pract* 23(2): 155-159, 1970.

6265 CHLORHYDROXYQUINOLIN (HALQUINOL) IN GIARDIASIS. *(E.)* Pimparkar, B. D. (Seth G. S. Med. Coll., Bombay, India), H. Y. Pathak, U. M. Dond
and N. T. Bhivankar. *Indian Pract* 23(2):165-170, 19

6266 GIARDIASIS—CLINICAL FEATURES AND ITS TREA
MENT WITH METRONIDAZOLE. *(E.)* Sardesal, H. V. (B. J. Med. Coll., Poona, India). *Indian Prac*
23(2):171, 1970.

6267 PNEUMATOSIS INTESTINALIS: A CASE REPORT WITH A BRIEF LITERATURE REVIEW. *(E.)* Kutty, M. K. (Inst. Med. Res., Kuala Lumpur, Malaysia), B. Nambiar and K. Bau. *Med J Malaya* 24(3): 227-230, 1970.

6268 ANTIGENIC ANALYSIS OF THE DEVELOPMENTAL STAGES OF *ASCARIS SUUM*: II. HOST COMPONENTS. *(E.)* Williams, J. F. (Office Sanit. Panamer
ca, Buenos Aires, Argentina) and E. J. L. Soulsby. *Exp Parasit* 27(3):362-367, 1970.

6269 SUPPRESSION OF THE HEPATOSPLENIC *SCHISTOSOMIASIS MANSONI* IN MICE BY NICARBAZIN, A
DRUG THAT INHIBITS EGG PRODUCTION BY SCHISTOSOMES. *(E.)* Warren, K. S. (Case Western Reserve U., Sch. Med., Cleveland, Ohio). *J Infect Dis* 121(5):514-52
1970.

6270 INTERFERENCE OF HEPATIC DRUG METABOLISM I
PLASMODIUM BERGHEI-INFECTED MICE AND ITS THERAPEUTIC MODIFICATION: A STUDY OF HEXOBARBITAL SLEEPING TIME AND PHENOBARBITAL-INDUCED LIVER STIMU
LATION. *(E.)* Einheber, A. (Walter Reed Army Inst. Res., Washington, D. C.), R. E. Wren and C. J. Klob
kowski. *Exp Parasit* 27(3):424-443, 1970.

6271 DIAGNOSTIC AND PROGNOSTIC VALUE OF CALCI
CATION IN ALVEOLAR ECHINOCOCCOSIS OF THE LIVER. *(Rus.)* Pribylovsky, S. L. (Altai Med. Inst
Barnaul, U.S.S.R.), R. Ya. Sheffer and N. P. Krylo
Vestn Rentgen Radiol 45(1):29-35, 1970.

272 AMEBIASIS IN CAPE TOWN CHILDREN. *(E.)*
Watson, C. E. (Red Cross War Mem. Child.
osp., Cape Town, South Africa), P. M. Leary and
. S. Hartley. *S Afr Med J* 44(14):419-421, 1970.

273 IMMUNOLOGICAL RESPONSE OF THE MAMMALIAN
HOST AGAINST TAPEWORM INFECTIONS: IX.
RANSFER VIA COLOSTRUM OF IMMUNITY TO *TAENIA HYDA-*
IGENA. (E.) Gemmell, M. A. (U. Otago Med. Sch.,
nedin, New Zealand), S. K. Blundell-Hassell and
N. Macnamara. *Exp Parasit* 26(1):52-57, 1970.

74 SONNE DYSENTERY IN NEW ZEALAND. *(E.)*
Markham, N. P. (U. Otago Med. Sch.,
nedin, New Zealand) and H. C. W. Schott. *New Zeal*
d J 70(446):15-20, 1970.

75 INTESTINAL ABSORPTION IN MALARIA: I. THE
ABSORPTION OF AN AMINO ACID (AIB-1-^{14}C)
ROSS THE GUT MEMBRANE IN NORMAL AND IN *PLASMODIUM*
OWLESI-INFECTED MONKEYS. *(E.)* Migasena, P.
iverpool Sch. Trop. Med., England) and B. G.
egraith. *Ann Trop Med Parasit* 63(4):439-448,
70.

76 NUTRITION AND PARASITISM AMONG RURAL PRE-
SCHOOL CHILDREN IN SOUTH CAROLINA. *(E.)*
rter, J. P. (Dept. Pediat., Vanderbilt U., Nash-
lle, Tenn.), R. Vanderzwaag, W. J. Darby, E. J.
ase, F. H. Lauter, B. W. Dudley, E. G. High, D. J.
ight and T. Murphree. *J Nat Med Ass* 62(3):181-191,
70.

77 FURTHER OBSERVATIONS ON BILHARZIA CONTROL
IN THE EASTERN TRANSVAAL. *(E.)* Pitchford,
J. (S. African Med. Res. Counc., Nelspruit, E.
ansvaal, Union of South Africa). *S Afr Med J*
(16):475-477, 1970.

DESCRIPTION OF INDEXES

SUBJECT and AUTHOR INDEXES for Gastroenterology Abstracts and Citations, Volume 5, are produced from on-line computer print-out of key-punched cards.

The SUBJECT INDEX is based on a hierarchial system of classification in which *major index terms* are modified by one or more *key word descriptors*. The *key word descriptors* are listed in decreasing order of importance and describe the content of the abstract or citation. In addition, in this indexing system, some *key word descriptors* will also be used as *major index terms*, thus providing in-depth indexing of each document. An abstract or citation number, in brackets, will be found after the *key word descriptors*. Abstracts will be identified by an asterisk outside of the brackets.

An illustrative example of this indexing system follows:

INTESTINE, LARGE
    Colon, Carcinoma, Radiological Detection, Rectum (0188)*

COLON
    Cancer, Polyps, Radiological Detection (0188)*

RECTUM
    Cancer, Polyps, Precancerous (0188)*

CANCER
    Large Intestine, Detection, Radiology (0188)*

DIAGNOSIS
    Radiology, Cancer, Large Intestine (0188)*

umbers followed by an asterisk refer to abstracts in the text. Other numbers refer to citations.

SUBJECT INDEX

- ABDOMEN
  - ACUTE, PANCREATITIS, TRANSAMINASE, CREATINE PHOSPHOKINASE, DUODENAL JUICE, STOOLS (5666)
  - AMEBIC DYSENTERY, INTESTINAL COMPLICATIONS, HEPATIC AMEBIASIS, FEVER (6253)
  - IATROGENOUS INJURY, PERFORATION, STENOSIS, JAUNDICE (6221)
  - PAIN, CONVULSIONS, SHIGELLOSIS, COPROCULTURES, ANTIBIOTICS, MENINGITIS, INFANTS (5740)
  - RADIONUCLIDE, AORTOGRAPHY, GAMMA SCINTILLATION CAMERA (5671)
  - RECURRENT PAIN, CHILDREN, IRRITABLE BOWEL SYNDROME (6212)
  - TRAUMA, PSEUDOMYXOMA PERITONEI, INTESTINAL RUPTURE, CACHEXIA, TUMOR, DIGESTIVE DIFFICULTIES (6239)
  - WHIPPLE'S DISEASE, CORYNEBACTERIA, DIFFUSE PAIN, FROTHY HISTIOCYTES, ELECTRON MICROSCOPY (5887)*
- ABSCESS
  - HEPATIC, DRUG INFUSION, UMBILICAL VEIN (6039)
- ABSORPTION
  - ASPIRIN, SULFONAMIDE, PH, IN VITRO MODEL (5487)*
  - CELL TRANSPORT, GASTROINTESTINAL TRACT (5498)
  - CHOLESTEROL, METABOLISM (5682)
  - COLON, EDTA, ULCERATIVE COLITIS (5951)
  - DIGOXIN, PERFUSION STUDY, INTESTINE, RAT (5504)
  - DRUG, INTESTINAL, MESENTERIC BLOOD FLOW (5501)
  - DRUG, INTESTINE, DAMAGE, TRIPARANOL, IRRADIATION, RAT (5855)*
  - DRUG, SMALL INTESTINE, POLYSORBATE 80, OLEIC ACID, RAT (5502)
  - FAT, MARASMUS, JEJUNUM, CHILDREN (6224)
  - GASTROINTESTINAL TRACT, KEROSENE, PNEUMONITIS (5497)
  - INTESTINAL, MOTILITY, HYPOTHERMIA, PERFUSION, O2 UTILIZATION (5615)*
  - INTESTINE, CALCIUM, PHOSPHORUS, LACTOSE TOLERANCE (5612)*
  - INTESTINAL, EVERTED GUT TECHNIQUE (5479)*
  - INTESTINAL, FREE AMINO ACIDS, PROTEIN (5483)*
  - INTESTINE, HEMOGLOBIN, IRON, RAT (5490)*
  - INTESTINE, MALARIA, AMINO ACID (6275)
  - IRON, CIRRHOSIS, PORTACAVAL SHUNT, DOGS (6114)*
  - GASTROINTESTINAL TRACT, TAURINE, GLYCINE, ASPIRIN, SMALL INTESTINE (5503)
  - PROTEIN, AMINO ACIDS, JEJUNUM, DUODENUM (5482)*
  - SMALL INTESTINE, AMINO ACID, CARNOSINE, HARTNUP DISEASE (5475)*

PREFACE

GASTROENTEROLOGY ABSTRACTS and CITATIONS is a publication of the National Institute of Arthritis and Metabolic Diseases. This specialized information medium has been initiated to fill an existing great need in the field of gastroenterology and to assist the Institute in meeting its obligations to foster and support laboratory and clinical research into the nature, causes, and therapy of diseases of the gastrointestinal tract. Publication of GASTROENTEROLOGY ABSTRACTS and CITATIONS makes available citations of all current papers relevant to this field from medical journals published throughout the world. Approximately one-third of the citations dealing with the major aspects of gastroenterology have accompanying abstracts.

The issuing of GASTROENTEROLOGY ABSTRACTS and CITATIONS under the auspices of the National Institute of Arthritis and Metabolic Diseases will provide a much needed current awareness tool to scientists and will facilitate greater integration of research and clinical efforts in this field. The number and great diversity of publications in the area of gastroenterology makes it imperative that an appropriate service be available t investigators and practitioners so that they may be apprised of progress with a minimum of delay. Our aim is to provide the readers with a readily systematized compilation of current published work. The publication will provide the greatest usefulness if these interested investigators will contribute their ideas and comment for consideration whenever possible.

GASTROENTEROLOGY ABSTRACTS and CITATIONS is published monthly and includes citations and abstracts from the biomedical world literature as they are currently received. In addition, yearly cumulated subject and author indexes are published.

This publication is available free to National Institutes of Health grantees and contractors working in the field of gastroenterology and libraries of medical schools. Requests from these qualified individuals to receive free copies of this publication must include their grant or contract number and the title of their project. These requests as well as address changes and other communications should be addressed to:

Scientific Communications Office
Gastroenterology Abstracts and Citations
National Institute of Arthritis and Metabolic Diseases
National Institutes of Health
Bethesda, Maryland 20014

Other individuals and libraries may receive this publication by subscribing *directly* to the Superintendent o Documents, U.S. Government Printing Office, Washington, D.C. 20402. Subscription price per year in the United States, Canada, and Mexico, $16.00; foreign, $4.00 additional; and $1.25 for a single copy. Payment required in advance, and check or money order should be made payable to the Superintendent of Documents.

ABBREVIATIONS USED IN ABSTRACTS

ACTH	adrenocorticotropic hormone
ADP	adenosine diphosphate
AMP	adenosine monophosphate
ATP	adenosine triphosphate
BSP	sulfobromophthalein
C	degrees centigrade
cm	centimeter(s)
CNS	central nervous system
cpm	counts per minute
DNA	deoxyribonucleic acid
e.g.	for example
g	gram(s)
µg	microgram(s)
hr	hour(s)
i.m.	intramuscular
i.p.	intraperitoneal
IU	international unit(s)
i.v.	intravenous
kg	kilogram(s)
LD_{50}	median lethal dose(s)
LDH	lactic acid dehydrogenase
m	meter(s)
M	molar
mEq	milliequivalent(s)
mM	millimolar
µM	micromolar

mC,µC	milli-,microcurie(s)
mg	milligram(s)
min	minute(s)
ml	milliliter(s)
mm	millimeter(s)
MTD	maximum tolerated dose
ng	nanogram (10^{-9})
pg	picogram (10^{-12})
p.o.	orally
ppm	parts per million
r	Roentgen
RBC	red blood cells (erythrocytes), red blood count
resp.	respectively
Rev.	review (only in citations)
RNA	ribonucleic acid
s.c.	subcutaneous
sec	second(s)
SGOT	serum glutamic-oxalacetic transaminas
SGPT	serum glutamic-pyruvic transaminase
U	unit(s)
UV	ultraviolet
WBC	white blood cells (leukocytes), white blood count
yr	year(s)

PRE-CLINICAL SCIENCES

MORPHOLOGY, CELLULAR STRUCTURE AND HISTOCHEMISTRY

3 ELECTRON MICROSCOPIC STUDIES OF THE JEJUNAL
EPITHELIUM FROM NEONATAL PIGS FED DIFFERENT
TS. *(E.)* Broughton, C. W. (Anim. Sci. Dept.,
th Carolina St. U., Raleigh) and J. G. Lecce.
utr 100(4):445-449, 1970.

effects of simple and complex diets known to
ect closure on pinocytic activity in immature
let gut epithelium were studied by feeding glu-
e or colostrum (simple and complex diets, resp.)
a simple salt solution as control to 8 piglets
ch were then sacrified and the jejunal tissue
oved and prepared for electron microscopy. Je-
al tissue from piglets at various developmental
ges showed columnar epithelial cells with a
iated border of microvilli while the lateral
pranes revealed desmosomes and interdigita-
ns. In piglets fed colostrum, indented plasma
pranes and structures resembling lysosomes were
sent. Mucosal cells from those fed glucose also
wed irregular plasma membranes and many pinocytic
nnels and vesicles. Tissue from piglets fed
t solution, which only slightly effects closure,
onstrated reduced pinocytic activity with more
ular plasmalemma and few vesicles and vacuoles.
pinocytic activity was found in gut epithelium
sed with colostrum or treated with 6-dinitro-
resol, a metabolic inhibitor.

4 THE ENDOCRINE CELLS OF HUMAN DUODENAL
MUCOSA: AN ELECTRON MICROSCOPE STUDY.
Kobayashi, S. (Niigata U. Sch. Med., Japan),
Fujita and T. Sasagawa. *Arch Histol Jap*
3-4):477-494, 1970.

occurrence and ultrastructure of five different
es of endocrine cells in human duodenal mucosa
e studied by electron microscopy in 3 surgical
psy specimens fixed with glutaraldehyde and
ium tetroxide and stained with uranyl acetate
lead. The cells of endocrine structure occurred
nly in the deeper portions of the crypts of
berkuhn and the ducts of Brunner's glands, with
endocrine elements in the villus epithelium.
e different types of endocrine cells were ob-
ved and were classified as: (1) enterochromaffin
ls with dense, polymorphous granules; (2) type
ndocrine cells with large (250-400 nm) round
al granules; (3) type 3 cells with pyramidal or
ndle shape, containing small (150-250 nm) round
nules and intranuclear fibrous cytoplasm; (4)
e 4 endocrine cells containing small round
nules and characterized by a rounded thick shape,
h a constricted neck at the apical end which ex-
ded horizontally and was covered by a tuft of
rovilli; and (5) intestinal D cells with medium
ed (300-400 nm) round granules morphologically
ntical with those found in pancreatic D cells of
electron density and finely granulated texture.
five types of endocrine cells all appeared to
e the lumen of the crypts of the ducts with the
row apical process covered with microvilli.

5 STAINING AND ELECTRON MICROSCOPIC
CHARACTERISTICS OF AMINE-STORING CELLS
RAT GASTRIC MUCOSA. *(E.)* Hirvonen, J. (Dept. Anat., U. Helsinki, Finland) and A. Penttila. *Scand J Gastroent* 5(3):177-185, 1970.

Amine-storing cells in the gastric mucosa of rats were characterized by staining (lead acetate, toluidine blue and cresyl violet), fluorescence (formaldehyde and o-phthaldialdehyde vaporing), and electron miscroscopy. Numerous mucosal mast cells situated interglandularly in the neck region of the gastric mucosa stained with cresyl violet and toluidine blue and coincided with the fluorescent areas after formaldehyde and o-phthaldialdehyde vaporing which demonstrated 5-hydroxytryptamine and histamine, resp. Mucosal mast cells varied in shape and had irregular nuclei surrounded by large osmiophilic granules with membranes, few mitochondria, and poorly developed Golgi bodies, while enterochromaffin cells were characterized by uniform round osmiophilic granules located next to the basement membranes of the cells, and the most numerous eosinophilic leucocytes were distinguished by highly osmiophilic crystals in the center of the granules. The more intense o-phthaldialdehyde-induced staining of the enterochromaffin cells indicated they are the principal storers of histamine, while formaldehyde-induced fluorescence (5-hydroxytryptamine indicator) was significant in both mucosal mast cells and enterochromaffin cells.

6286 EFFECTS OF TOXOHORMONE ON THE ULTRASTRUCTURE OF RAT HEPATOCYTES. *(E.)* Parry, E. W. (Dept. Histol., U. Liverpool, England) and F. N. Ghadially. *J Path* 100(3):161-168, 1970.

Ultrastructural changes similar to those occurring in the liver of the tumor-bearing rat were produced in the hepatocytes of normal male albino rats (8 animals used in the study) following i.p. injection (over a period of 10 days) of a crude toxohormone fraction prepared from the Walker carcinoma. Light microscopy revealed no obvious changes, but electron microscopy showed prominent collections of hepatocellular lysosomes in samples from those animals treated with toxohormone in which bile canaliculi examined were completely devoid of attendant lysosomes in the plane of section, and collections of 20 to 30 lysosomes were not infrequent. A 2-fold increase in hepatocellular lysosome numbers was found in the toxohormone treated animals over untreated, normal tissue fraction treated, and saline treated animals. Occasional bile canaliculi from the livers of the toxohormone treated animals showed dilatation of the lumen, with a simplified appearance due to loss of microvilli over part of the periphery. Small membrane-enclosed collections of recognizable cytoplasmic organelles were frequently seen in toxohormone treated animals, but not in the other groups.

6287 COMPARATIVE STUDIES ON NUCLEI AND CHROMATIN OF HEPATOMAS AND RAT LIVER. *(E.)* Grunicke, H. (Biochem. Inst. U. Freiburg, Germany), V. R. Potter and H. P. Morris. *Cancer Res* 30(3):776-787, 1970.

The protein composition of nuclei and chromatin from hepatoma 5123C and 7800 and from the host livers of male Buffalo rats was determined as well as the amounts of total nuclear chromosomal RNA and the phosphate content of the nuclear proteins. Thermal denaturation properties using chromatin preparations and template activities of the chromatin in a DNA polymerase system were also compared. There were no differences in the nature of the protein fractions studied from the host liver and hepatoma 5123C nor were there any differences in the concentration of total nuclear RNA. Novikoff cells showed a marked increase in residual nuclear protein and total nuclear and chromosomal RNA when compared to normal liver. The host liver and hepatoma 5123C showed a similar phosphate content of nuclear proteins. In the Novikoff cells the phosphorylation of the histones and the chromosomal nonhistone proteins was lower than in the host liver and hepatoma 5123C. Nearly identical temperatures of half-melting and total hyperchromicities for chromatin preparations of host liver, hepatoma 5123C, and Novikoff cells were demonstrated in the thermal denaturation studies. Hepatoma 5123C and 7800 had lower template activities of chromatin than their host livers while chromatin of Novikoff cells had a lower template activity than normal liver.

6288 EXPERIMENTAL STUDIES ON THE ISOLATED HUMORAL FACTOR WHICH PROMOTES THE SECRETORY ACTIVITY OF THE GASTRIC CHIEF CELLS AND THE EXOCRINE PANCREATIC CELLS: III. EFFECTS OF SUBSTANCES EXTRACTED FROM THE GASTRIC MUCOSA ON THE GASTRIC CHIEF CELLS. *(E.)* Mabuchi, Y. (Wakayama Med. Coll., Japan). *Arch Histol Jap* 31(3-4):255-268, 1970.

The effects of substances extracted from the gastric mucosa on the gastric chief cells in rats was investigated by light microscopy. Chemical color testing for reaction of amino acid or protein showed the presence of a phenol group and an imidazole group in the subnuclear portion of the gastric surface epithelial cells where *productin* vacuoles were seen. Amino acid analysis showed that the alcoholic (33%) extract of the mucosal tissue after immersion of the tissue contained 18 kinds of amino acids and 5 kinds of related compounds. Following injection (s.c.) of these extracted substances, the secretory activity of the gastric chief cells was studied morphologically in an attempt to identify a substance producing the same effects as *productin*. Arginine, histidine, lysine and tyrosine activity promoted the production of secretory granules in the chief cells while asparagine and serine promoted the vacuolization of the granules. These substances may be the components of *productin*.

6289 SOME OBSERVATIONS ON THE FINE STRUCTURE OF THE GUINEA PIG TAENIA COLI AFTER INCUBATION IN HYPERTONIC SOLUTION. *(E.)* Nishihara, H. (Dept. Pharmacol., U. Oxford, England). *J Anat* 107(1):101-114, 1970.

The fine structure of guinea pig taenia coli was studied by electron microscopy after incubation in hypertonic solution. In osmium-fixed taenia coli, incubated in hypertonic solution (620 m-osmole), no significant fine structural differences were noticed when compared to tissues incubated in normal (292 m-osmole) solution. Muscle spindles were spindle-shaped with a long region of constant diameter and the mitochondria were usually elongated and oriented along the long axis of the cell. Gross sections of muscle fibres incubated in hypertonic solution showed an enlarged intervening extracellular space between cells, but the nexuses between smooth muscle cells were intact; this indicates that the nexus is a stable structure and if it is the site of an electrical low-resistance pathway between cells, such a pathway can apparently persist in a hypertonic medium. The plasma membranes of 2 neighboring cells were separated by a nearly uniform gap of less than 20 nm and end to end, side to side and end to side approaches between cells were observed in specimens treated with hypertonic solution. The number of plasmalemmal vesicles was increased; they were enlarged and had a characteristic narrow-necked, flask-like shape following hypertonic incubation. The dense bodies were larger and the myofilaments less clearly defined than in normal muscle cells, in which small and large size filaments could be distinguished. The muscle was apparently not in a contracted state in a hypertonic solution.

6290 RABBIT LIVER AND RABBIT KIDNEY FRUCTOSE DIPHOSPHATASES: CATALYTIC PROPERTIES OF ENZYMES ACTIVATED BY COENZYME A AND ACYL CARRIER PROTEIN. *(E.)* Nakashima, K. (Nagoya U. Med. Sch., Japan), B. L. Horecker, S. Traniello and S. Pontremoli. *Arch Biochem Biophys* 139(1):190-199, 1970.

The catalytic properties of rabbit liver and rabbit kidney fructose diphosphatases were studied by spectrophotometry and chromatography, following treatment with CoA or acyl carrier protein from *E. coli*. The activity in the neutral pH range (relative activity: control 100%; treatment 364%) was increased several fold, and the pH optima was shifted from pH 8.8 to pH 7.5 in the presence of $MgCl_2$, and from pH 9.1 to pH 8.2 when $MnCl_2$ is the cofactor. Maximum activity required the presence of a chelating agent such as EDTA (0.005 and 0.5 mM) histidine (0.1 and 1.0 mM) or glycine (1 and 40 mM). The untreated enzymes were inhibited by excess fructose-1,6-diphosphate (10^{-3}M) whereas the activated enzymes were not, although the Km for this substrate was increased by approximately 10-fold. The modified enzymes were also sensitive to inhibition by AMP (0.5 mM). Reactions with CoA or acyl carrier protein were prevented by adding high concentrations of substrate (10^{-3}M) but not by AMP. Two sulfhydryl groups appeared to be blocked in the activated enzyme, and the changes in catalytic properties were reversed by treatment with sulfhydryl compounds such as cysteine or glutathione. Activation apparently involves the formation of disulfide linkages between CoA or acyl carrier protein and the enzyme. Activation by CoA or an acyl carrier protein may represent a physiological mechanism for the reciprocal control of gluconeogenesis and fatty acid synthesis.

291 HETEROGENEITY OF RAT LIVER MITOCHONDRIAL FRACTIONS AND THE EFFECT OF TRIIODOTHYRONINE
I THEIR PROTEIN TURNOVER.

(E.) Katyare, S. S.
3hadha Atomic Res Ctr., Bombay, India), P. Fatter-
ıker and A. Sreenivasan. *Biochem J* 118(1):111-121,
970.

reatment of thyroidectomized rats with triiodothyronine
ıs used to magnify the differential behavior of the
itochondrial fractions and to illustrate, from studies
ı protein synthesis and turnover rates, the relation-
nip in these particles. All mitochondrial fractions
neavy, light, and fluffy, separated by differential
entrifugation) possessed soluble as well as membrane-
ound enzymes typical of mitochondria. The heavy
raction was stable, whereas the fluffy and light
ractions were loosely coupled and lacked the ability
f coupled phosphorylation. The basic membrane struc-
ıre of all fractions were similar. The turnover
ates of proteins (as measured by DL-(1-^{14}C)-leucine
ncorporation) in the heavy and fluffy particles were
lmost identical (at 2 days, 2.5x10^{-2} and 3.2x10^{-2}
om/mg protein, resp.); whereas the label in the
ight fraction turned over at a comparatively faster
ate (6.3 x 10^{-2} cpm/mg protein at 2 days).
riiodothyronine stimulated succinoxidase acti-
ity maximally much earlier in the light fraction
3 hr) than in the heavy fraction (45 hr). The
ctivity in the fluffy particles, however, remained
naffected (plateaued after 10 hr). Malate dehy-
rogenase activity in all fractions was stimulated
nly at 40 hr after thyroid hormone treatment. La-
eled leucine incorporation *in vivo* in the treated
nimals (thyroid hormone) indicated a rapid initial
ncorporation (control 619; treatment 1113 cpm/mg
rotein) and high synthetic ability of the light
raction. The amount of light mitochondrial pro-
eins decreased on thyroidectomy and increased (40%
nd 160%, resp.) on treatment with triiodothyronine.

292 STUDIES ON PLASMA MEMBRANES: XII. FRACTIONATION OF THE ATPASE OF DEOXYCHOLATE-SOLUBIL-
ZED RAT LIVER AND HEPATOMA PLASMA MEMBRANES AND THE
ORPHOLOGICAL APPEARANCE OF THE PREPARATIONS.

(E.)
mmelot, P. (Netherlands Cancer Inst., Amsterdam),
. A. Feltkamp and H. Vaz Dias. *Biochem Biophys Acta*
11(1):43-55, 1970.

lasma membranes from rat livers were isolated, frac-
ioned by density gradient centrifugation and analyzed
or protein, phospholipid P^8 and enzyme activity.
he pellets (105,000 x g x 2 hr) of deoxycholate-
olubilized liver plasma membranes contained 28.3%
f the total protein and 23.0% phospholipid (super-
atant comprising the difference), while 49.1% of
he total protein and 26.7% phospholipid was found
n the comparable fractions of hepatoma-484 membranes.
fraction of *d* 1.10 to 1.12 was found to contain the
reatest amount of ATPase activity and phospholipid
f the pellets. Hepatoma-484 membranes revealed a
arked difference in the greater amount of sediment-
ble protein. Nucleotidase activity was found to
e lower in the hepatoma supernatant fraction (19.1
o 21.3 µmoles P$_i$) compared to the corresponding
iver fraction (45 to 55 µmoles P$_i$). A lower specific
TPase activity was also seen in the hepatoma frac-
ions. Tight junctions were revealed by electron microscopy in the most readily sedimenting fraction of liver membranes and basic organizational differences between hepatoma and normal liver membranes were found.

6293 PARACRYSTALLINE INCLUSION BODIES IN THE MITOCHONDRIA OF HUMAN LIVER PARENCHYMAL CELLS: ELECTRON MICROSCOPIC AND HISTOCHEMICAL STUDIES.

(Ger.) Themann, H. (Inst. Med. Phys. Wilhelms U., Munster, Germany) and D. B. Von Bassewitz. *Cytobiologie* 1(2):135-151, 1969.

Paracrystalline inclusion bodies found in mitochondria of about 35% of 230 human liver biopsies were studied using electron microscopy and histochemical techniques. The inclusions had a polyhedric shape formed by filaments with an average diameter of 95 Å, arranged in rows with an average distance 60 Å apart. Three or four rows seemed organized in a group which were separated by about 125 Å. The inclusion bodies showed a high cytochrome oxidase activity which was demonstrated with diaminobencidine. No relationship between the occurrence of these inclusion bodies in mitochondria and clinical and pathological findings could be demonstrated.

6294 ELECTRON MICROSCOPE STUDIES ON THE RELEASE OF HISTAMINE FROM RAT PERITONEAL MAST CELLS.

(E.) Yamasaki, H. (Okayama U. Med. Sch., Japan), T. Fujita, Y. Ohara and S. Komoto. *Arch Histol Jap* 31(3-4):393-408, 1970.

The effects of histamine-releasing agents and of rabbit anti-rat serum on the mast cells in rat peritoneal fluid were studied by electron microscopy, and the release of histamine was measured by bioassay, using atropinized guinea pig ileum. A peritoneal cell preparation with 5% mast cells was treated with Compound 48/80, sinomenine, toluidine blue, antiserum or the histamine release inhibitor, 2,4-dinitrophenol (DNP). The cells were prepared for electron microscopy with glutaraldehyde and OsO_4 and stained with lead monoxide or lead acetate. Three morphological changes in the mast cell accompany the release of histamine: degranulation, vacuolation, and altered structure of the vacuoles. Treatment with compound 48/80 at a dose of 0.1 µg/ml caused a swelling of the mast cell granules, a widening of the perigranular space in several cells, but no degranulation. At this low dose, histamine release from the mast cells was 38% of the total histamine release, compared with a baseline value of 3% release with no treatment. Moderate doses (1.0 to 5.0 µg/ml) produced increasing development of honeycombed perigranular vacuoles in the cytoplasm with degranulation in cells forming large peripheral vacuoles and histamine release at 5.0 µg/ml was 90% of the total. Treatment with toluidine blue (50 µg/ml) and with sinomenine (500 µg/ml) produced similar morphologic effects, and histamine release by these compounds ranged from 72 to 76% of the total. A large dose of compound 48/80 (100 µg/ml) produced numerous large vacuoles, but the majority of the granules were neither discharged nor swollen; histamine release was measured as 91% of the total. Anti-rat serum (10% V/V) caused a greater swelling of the granules and a greater vacuolation than did the histamine releasing agents, and resulted in a 86% histamine release. Pretreatment with 10^{-4} M DNP inhibited the cytological changes induced by compound 48/80.

6295 RAT LIVER PLASMA MEMBRANES IN ESSENTIAL FATTY ACID DEFICIENCY.

(E.) Chandrasekhara, N. (Central Food Technol. Res. Inst., Mysore, India) and K. A. Narayan. *J Nutr* 100(4):477-480, 1970.

The effect of essential fatty acid deficiency on rat liver plasma membranes with particular reference to marker enzyme activity and lipid and fatty acid composition was investigated. Membranes from deficient animals showed a lower 5'-nucleotidase activity (control 4; treatment 22.1 U/hr), but there was no difference in the Mg^{2+}-Na^{+}-K^{+}- ATPase activity between normal and deficient membranes. The cholesterol content of deficient membranes was lower (control 15.7; treatment 10.2% of total lipid) than that of the normal membranes, whereas the amount of total lipids and phospholipids was unaltered. There was a marked decrease in the 18:2 and 20:4 (control 15.0, 21.4%; treatment 4.5, 9.7%, resp.) and an increase in the 16:1, 18:1 and 20:3 fatty acids (control 2.0, 12.7, 0%; treatment 7.3, 20.5, 13.2%, resp.) of the deficient membranes as compared with membranes of normal rats. The marked alteration in the fatty acid composition and consequent changes in membrane configuration may be associated with a slight decrease in cholesterol content of the membranes.

6296 THE CHARACTERIZATION OF RAT INTESTINAL AMYLASE.

(E.) Alpers, D. H. (Washington U. Sch. Med., St. Louis, Mo.) and M. Solin. *Gastroenterology* 58(6):833-842, 1970.

An intestinal amylase was isolated from the brush border in the rat and characterized. This amylase was not inactivated at temperatures up to 65° C., was not chloride-activated, had a pH optimum of 5.5, was trypsin sensitive, had a Km of 0.02 M (moles of glucosidic bonds/l) with starch as substrate and 0.12 M with maltotetrose as substrate, and was indistinguishable from heat-stable maltase (polyacrylamide gell electrophoresis). Amylase activity in the supernatant fraction (105,000x *g*) of intestinal homogenates was determined to be pancreatic in origin by comparison in animals with bile duct fistulae or ligations and was difficult to remove so that heat inactivation (55 to 65° for pancreatic amylase) or another method must be used to measure pancreatic contamination.

6297 MICROSCOPIC INVESTIGATIONS OF ALTERATIONS IN KUPFFER CELLS AFTER ERYTHROPHAGOCYTOSIS.

(Ger.) Korb, G. (Path. Inst. U. Marburg, Germany) and G. Muhlenberger. *Virchow Arch Zellpath* 5(3):268-276, 1970.

Injection of pyrogallol (20 mg/100 g i.p.) in rats induced pronounced phagocytosis of erythrocytes by the Kupffer cells of the liver. The 27 animals which survived the initial injection of pyrogallol were sacrificed 4, 12, 24 and 48 hr and 3, 4, 5, 10 and 17 days later. At 4 hr after injection, many erythrocytes were present in the sinuses and Kupffer cells. After 24 hr, the Kupffer cells contained not only disintegrating erythrocytes and iron pigment granules but also an initially unpigmented fluorescent material with a PAS-positive reaction. This material became pigmented and seems to be identical with ceroid. After phagocytosis of erythrocytes, some of the Kupffer cells became necrotic and resembled hyaline necrosis of single liver cells or so-called Councilman bodies.

6298 BINDING OF CORTICOSTERONE IN RAT LIVER.

(E.) Snart, R.S. (Dept. Zool., U. Sheffiel England), N.N. Sanyal and M.K. Agarwal. *J Endocr* (2): 149-158, 1970.

The binding characteristics of corticosterone by rat liver was studied by a displaceable binding technique The binding of corticosterone to protein fractionated by gel filtration and density gradient centrifugation was carried out as a preliminary determination of the nature of the binding sites. Analysis of Scatchard plots obtained from binding studies showed 3 types of binding sites for corticosterone in rat liver with characteristic association constants at 0° of $K_1 = 1.2 \times 10^{10}$, $K_2 = 1 \times 10^{8}$ and $K_3 = 1 \times 10^{4}$ 1 /mole. Percentage displacement of corticosterone from the nuclear fraction did not differ significantly from that from tissue or the mitochondrial-microsomal fraction. The K_1 and K_2 sites persisted in separated buffer-soluble fractions but were destroyed on mild heating leaving only the K_3 sites. The rate of uptake of corticosterone by tissue is probably determined by diffusion, which would account for the time lag observed in the small pieces of liver used.

6299 AUERBACH'S PLEXUS OF MAMMALS AND MAN: ELE TRON MICROSCOPIC IDENTIFICATION OF THREE DIFFERENT TYPES OF NEURONAL PROCESSES IN MYENTERIC GANGLIA OF THE LARGE INTESTINE FROM RHESUS MONKEYS, GUINEA-PIGS AND MAN.

(E.) Baumgarten, H. G. (Dept. Neuroanat., U. Hamburg, Germany), A. F. Holstein and C. Owman. *Z Zellforsch* 106(3):376-397, 1970.

Biopsy specimens from corresponding parts of human and mammalian (rhesus monkeys and guinea pigs) large intestine were used for the electron microscopic study of the myenteric ganglia from Auerbach's plexu Three different types of neuronal processes could be distinguished in the myenteric neuropil according to the size, appearance and commutual proportion of vesicles present in axonal varicosities, and their ability to accumulate exogenous 5- and 6-hydroxydopamine and 5-hydroxydopa. Axonal enlargements containing a major population of small electron lucent "synaptic" vesicles (350 to 600 Å) existed together with a small number of membrane-bound, opaque granul (800 to 1,100 Å) which were identified as "cholinergic" axons. The boutons established synaptic contac with dendritic processes of intrinsic nerve cell bodies; membrane specializations were found at the pre- and postsynaptic sites. Axonal beads of large diameter, containing an equal amount of large granul vesicles (850 to 1,600 Å) and small, faintly opaque

esicles (400 to 600 Å) were seen. Neuronal process
ıvolving varicosities of axons equipped with small
00 to 600 Å) empty or granular vesicles, medium-
.zed (500 to 900 Å) vesicles with high electron
ense cores and occasional large (900 to 1,300 Å)
anular vesicles were also present. Pretreatment
ith 5-hydroxydopamine increased the electron density
ı medium sized granular vesicles and in some large
anular vesicles. Degenerative changes in the vari-
ɔsities of this type of neuron resulted from pre-
eatment with 6-hydroxydopamine. Both catecholamine
ıalogues reduced neuronal noradrenaline in the large
ıtestine, as demonstrated by fluorescence histo-
ıemistry and fluorimetric determinations. The ultra-
ructural features of these varicosities and their
eaction to 5- and 6-hydroxydopamine indicated that
ıey belong to adrenergic sympathetic nerves. No
embrane specialization could be detected at sites
f close contact of the adrenergic boutons with
endrites and cell bodies of intrinsic nerve cells.

00 CYTOCHROME b_5 AND CO-BINDING CYTOCHROMES
IN THE GOLGI MEMBRANES OF MAMMALIAN
VERS. *(E.)* Ichikawa, Y. (Osaka U. Med. Sch.,
aka, Japan), and T. Yamano. *Biochem Biophys*
s Comm 40(2):297-305, 1970.

udies were made of the electron transport system
hepatic microsomes in which the Golgi and plasma
mbranes and the smooth- and rough-surfaced micro-
mes were separated from the whole microsomal frac-
on of normal rabbit liver. The Golgi membranes
ich account for 5% of total microsomal protein
d a similar cytochrome b_5 and lower cytochrome
450 content compared to smooth- and rough-surfaced
crosomal membranes. Pretreatment with pheno-
rbital induced cytochrome P-450 5-fold in the
lgi membranes and 2-fold in the microsomal mem-
anes. However, pretreatment with 3-methylcholan-
rene resulted in the induction of cytochrome
448 in the Golgi membranes and in the smooth-
d rough-surfaced microsomes.

01 ISOLATION AND CHARACTERIZATION OF *IN*
VITRO RADIOACTIVELY LABELED SH-PROTEINS
OM RAT LIVER MITOCHONDRIAL MEMBRANES. *(E.)*
mmer, G. (Inst. Vegetative Physiol, U. Frank-
rt, Germany). *FEBS Letters* 9(2):108-112, 1970.

attempt is made at localization of sulfhydryl
oups in liver mitochondrial membrane proteins
use of S^{35}-labeled maleimide and isolation and
beling of the F_1-ATPase from sonicated mitochon-
ia. After appropriate incubation and gel filtra-
on, the radioactive peak was dialyzed and cellulose
etate electrophoresis performed. Radioactivity
edominated in the basic structural proteins and
t significantly in the oligomycin insensitive
Pase protein. The maleimide effects of mitochon-
ial ATPase appears to be mediated through action
structural proteins.

02 SELECTIVE REMOVAL OF RIBONUCLEIC ACID
RESPONSIBLE FOR HYPERBASOPHILIA IN RAT
VER PARENCHYMA DURING AZO DYE CARCINOGENS. *(E.)*
Briere, N. (Fac. Med. U. Sherbrooke, Quebec, Canada).
J Histochem Cytochem 18(7):498-503, 1970.

Male rats (200 g) were fed a low protein diet containing 0.06% of the azo dye 4-dimethylaminoazobenzene. Possible preneoplastic areas and hepatomas of serial liver sections showed intense staining with toluidine blue and bromophenol blue. Less intense staining was revealed in control sections of the cytoplasmic proteins of the hyperbasophilic cells. RNA was extracted from areas of increased basophilia in hyperbasophilic foci and hepatomas by treating for 4 to 5 min with solutions containing 1 µg/ml ribonuclease without alteration of the cytoplasmic hyperbasophilia as judged from stain intensity. It was found that the RNA of these areas was more susceptible to mild ribonuclease treatment than normally occurring RNA.

6303 A FACTOR OF PROTEIN CHARACTER IN RAT LIVER INHIBITING LIPASE ACTIVITY OF RAT PANCREAS. *(E.)* Machovich, R. (Semmelweis U. Med. Sch., Budapest, Hungary), J. Csillag and A. Naray. *FEBS Letters* 9(2):119-120, 1970.

The effect of a component of rat liver homogenate on lipase activity of rat pancreas extracts was studied. The component, which appears to be associated with a protein (estimated molecular weight 100,000), inhibited lipase activity of the pancreas. Inhibitory effect was abolished by trypsin treatment, but not by ribonuclease. Heat treatment at 50° for 5 min destroyed 50% of its activity and at 60° for 5 min destroyed 100% of its activity. The inhibitor factor was not contaminated by trypsin or other proteolytic activities in quantities which would depress lipase activity. Inhibitor factor was apparently specific for lipase; amylase and trypsin were not inhibited by this factor. Since the lipase inhibitor was able to relieve the hemolytic effect of lipase, it appears to play an important role in the protection of the organism and its function may be more significant in cases of some pathological process.

6304 DIFFERENTIATION OF IMMATURE MUCOUS CELLS INTO PARIETAL, ARGYROPHIL AND CHIEF CELLS IN STOMACH GRAFTS. *(E.)* Matsuyama, M. (Aichi Cancer Ctr. Res. Inst., Nagoya, Japan) and H. Suzuki. *Science* 169(3943):385-387, 1970.

Microscopic and submicroscopic techniques were used to determine the origin of cell types in gastric mucosal epithelium in mice. Secretory granules were noted in the mucous cells and the fundic glands contained numerous parietal cells with well-developed intracellular canaliculi. Young mice (less than 24 hr old) were subcutaneously grafted with the glandular portion of stomach of their littermates. Examination of the graft tissue revealed that all epithelial cells were positive for the periodic acid-Schiff reaction and that only mucous cells survived as epithelial cells. Immature mucous cells were found to differentiate into mature mucous, parietal and chief cells. After formation of a thin regenerating epithelial layer of only mucous cells, pits and glands differentiated and parietal, argyrophil and chief cells subsequently formed in that order. The immature mucous cells of mice are concluded to be totipotent.

6305 STUDIES ON VITAMIN E ACTION: PEROXIDATION INHIBITION IN STRUCTURAL PROTEIN-LIPID MICELLE COMPLEXES DERIVED FROM RAT LIVER MICROSOMAL MEMBRANES. *(E.)* Tinberg, H. M. (Dept. Zool., U. California, Los Angeles) and A. A. Barber. *J Nutr* 100(4):413-418, 1970.

A system consisting of a complex formed from rat liver microsomal structural protein and lipid micelles was used to examine the binding of microsomal structural protein with antioxidants and to relate antioxidant activity to this binding. The antioxidant activities of vitamin E and butylated hydroxyanisole on microsomal suspensions were also examined. Vitamin E and butylated hydroxyanisole inhibited lipid peroxidation in microsomal suspensions and in the test system consisting of microsomal structural protein and lipid micelles. A common inhibitory mechanism was suggested by the similarity of the 2 systems in their response to the 2 inhibitors. The peroxidation in the complex resulted in marked decreases in arachidonic, oleic and linoleic acid (100, 31, 63%, resp.) and these decreases were completely inhibited by 250 μg of vitamin E and 4 to 5 μg of butylated hydroxyanisole. The structural protein was bound to vitamin E but not to the synthetic antioxidant (less than 1%), suggesting that the binding may involve the hydrocarbon chain of vitamin E. Vitamin E inhibition of peroxidation in the complex was correlated with the amount of the antioxidant bound, whereas inhibition by butylated hydroxyanisole was not. These binding differences suggest a possible difference in the physiological action of vitamin E and butylated hydroxyanisole.

6306 THE DEPLETION OF THE GRANULES OF ARGYROPHIL CELLS OF DOG DUODENUM BY RESERPINE. *(E.)* Singh, I. (Med. Coll. Rohtak, India). *Z Zellforsch* 107(1):111-118, 1970.

The effect of reserpine on argyrophil cell granules of dog duodenum was investigated by light microscopy. Of 8 dogs, 3 were control, 3 received 5 mg/kg, 1 received 2.5 mg/kg and 1 received 1 mg/kg reserpine. Except in 1 dog a dose of 5 mg/kg caused a complete disappearance of argentaffin and argyrophil cells. A dose of 1 mg/kg has again markedly depleted the argentaffin cells (number of cells/high power field, control 6.5; treatment .50) and there was a slight but noticeable effect on the mean level of argyrophil cells (control 21.2; treatment 16.4). The depletion of argyrophil cells appears to be dose-related and in addition to the depletion in number, the argyrophil cells of reserpine treated animals show considerable reduction in size and in density of granules.

6307 DOLICHOL MONOPHOSPHATE GLUCOSE: AN INTERMEDIATE IN GLUCOSE TRANSFER IN THE LIVER. *(E.)* Behrens, N. H. (Campomar Found., Inst. Invest. Biochem., Buenos Aires, Argentina) and L. F. Leloir. *Proc Nat Acad Sci* 66(1):153-159, 1970.

The physical and chemical properties of partially purified acceptor-lipid from pig liver was compared with that of synthetic dolichol phosphate to establish their identity. Incubation of rat liver microsomes with UDPG labeled in the glucose moiety and acceptor lipid led to the appearance of radioactivity in the chloroform-soluble fraction (3.7 mole) Glucosylation was proportional to the amount of acceptor lipid added. The glucosylated acceptor lipid was acid labile and yielded 1,6-anhydroglucosan after alkaline treatment (45 min. at 100°C with 1N NaOH in aqueous *n*-propanol). Incubation of the glucosylated acceptor lipid with microsomes at 30° in the presence of 1.3% Triton X-100 yielded a glycoprotein which was subsequently hydrolyzed to glucose. The compound obtained by the chemical phosphorylation of dolichol appears to be the same as the acceptor lipid isolated from liver in giving the same results with the above reactions and having the same R_f value on thin-layer chromotography

6308 ULTRASTRUCTURAL LOCALIZATION OF CARBONIC ANHYDRASE IN RAT STOMACH PARIETAL CELLS. *(E.)* Cross, S. A. M. (Res. Inst., Smith Kline and French Lab., Hertsfordshire, England). *Histochemie* 22(3):219-225, 1970.

Carbonic anhydrase (CA) was localized (by the floatin incubation method of Hausler) in the canaliculi of the parietal cells of the stomach of the rat with the optical microscope and a modification of the method was used for demonstrating CA with the electron micr scope. The Hausler technique gave negative results with acetazolamide treatement (1 x 10^{-3} M to 5 x 10^{-} heating at 100°C for 3 min, or omission of substrate from the medium. Hansson's modification was satisfactory only if the sulfuric acid concentration was lowered 0.5 to 0.05 M, the cobalt sulfate concentration raised from 0.002 to 0.0025 M, or the temperatu raised from 22° to 37°C. For the electron microscop a mixture of 4% formaldehyde and 0.5% glutaraldehyde in Millonig's buffer was used for fixation followed by a brief post-fixation with osmium tetroxide and rapid dehydration in absolute ethanol or acetone, and the CA activity resulted in a cobalt sulfide deposit on the outside of the microvilli in the canaliculi of the parietal cells.

6309 ISOELECTRIC FOCUSING OF HUMAN LIVER ALKALINE PHOSPHATASE. *(E.)* Latner, A. L. (Roy. Victoria Infirm., Newcastle, England), M. E. Parsons, and A. W. Skillen. *Biochem J* 118(2):299-302, 1970.

The isoelectric focusing column technique was appli to human liver alkaline phosphatase in a sucrose d sity gradient with LKB ampholine as carrier ampholy Enzyme activity of alkaline phosphatase in 50 g sp imens of human liver was assayed in p-nitrophenyl phosphate substrate. When alkaline phosphatase pre arations were diluted 5- and 10-fold with water or with 1% ampholine, the enzyme was inhibited by 75%

ldition of 0.5 mM Zn^{2+} to the phosphatase preparation luted with 1% ampholine reversed the inhibition of osphatase activity, but addition of 0.1-5.0 mM Mg^{2+} d no effect on reversal of inhibition. A reacti- tion procedure was devised to counter the chelating operties of the ampholytes and the pH gradient. actions of the alkaline phosphatase preparation re applied to the electrofocusing column and 3 ml actions were collected (all with a pH below 7.0) d were reactivated and phosphatase activities as- yed. A peak containing 64% of the phosphatase tivity occurred at pH 3.9. The procedure was peated after 6 months with the same liver prep- ation (stored at -20°C) and the isoelectric point s again pH 3.9, with a smaller peak at pH 4.0.

10 THE DISTRIBUTION OF WATER-SOLUBLE BLOOD GROUP A ANTIGEN IN THE HUMAN LARGE INTESTINE: MOSAIC PATTERN. *(E.)* Sanders, E. M. (U. Alabama, rmingham) and S. P. Kent. *Lab Invest* 23(1):74-78, 70.

e distribution of water-soluble blood group A tigen was studied using an indirect fluorescent tibody technique in tissue taken from multiple vels of the large intestine of 30 human blood type secretors and non-secretors, ranging in age from illborn fetus to 67 years. Twenty-eight subjects re blood type A$_1$, one subject was type A$_1$B and e was type O and was used as a control. Based on e distribution of A antigen in saliva or in the odenum, 20 of the subjects were classified as cretors and 9 were nonsecretors. The presence of antigen was demonstrated in the intestinal sections treating tissues with fluorescein-labeled anti- man IgG and examination with a Zeiss fluorescence it. No A antigen was demonstrated in the large testine of the nonsecretors, while some goblet lls in all secretors contained A antigen. Goblet lls in the cecum and in the ascending colon of cretors contained A antigen regardless of the age the patient, while goblet cells in the distal rge intestine contained no antigen but did contain cin with histochemical properties similar to jacent goblet cells containing A antigen. The stribution of A antigen from the cecum to the anus s that of a progressively decreasing number of blet cells containing A antigen, and produced a saic pattern mostly in the terminal large intestine all age groups, but there was a higher percentage A antigen containing cells in fetuses than in ults. The mosaic staining pattern indicates that early fetal life, mucin is synthesized by some blet cells in the large intestine which do not have antigen determinants, while adjacent histochemically milar cells do contain A antigen. The scarcity of ter soluble A antigen in adult distal large intes- ne is possibly due to hydrolytic action by bacterial zymes.

11 THE ISOLATION OF POLYSOMES FROM RAT LIVER: CONTAMINATION OF POLYSOMES BY RIBONUCLEO- OTEIN OF NUCLEAR ORIGIN. *(E.)* Olsnes, S. (Norsk dro's Inst. Cancer Res., Oslo). *Biochem Biophys ta* 213(1):149-158, 1970.

ABSORPTION—EXCRETION—TRANSPORT

6348 EFFECTS OF VITAMIN E AND ESSENTIAL FATTY ACID DEFICIENCIES ON THE INTESTINAL TRANSPORT OF L-VALINE AND α-METHYL-D-GLUCOSIDE IN THE RAT. *(E.)* Imami, R. H. (Methodist Hosp., Peoria, Ill.), S. Reiser and P. A. Christiansen. *J Nutr* 100(1):101-109, 1970.

Dietary vitamin E and essential fatty acid deficiencies were induced in male rats (40 to 50 g) in order to correlate the functional role of lipid-soluble factors in membranes (using *in vitro* inverted sac technique) with the requirement for intestinal transport of amino acids (valine) and sugars (methyl-D-glucoside). The animals received a diet deficient in vitamin E or essential fatty acids or a deficient diet supplemented with *Torula* yeast and selenium, while control animals received a nutrient-fortified diet. Essential fatty acid deficiency was observed by the growth changes and was confirmed by chromatographic and photometric analysis of intestinal mucosal scrapings and liver specimens. Transport mechanisms were studied by monitoring to measure radioactivity distribution of labeled l-valine and methyl-D-glucoside. In a 12-week observation period the control rats gained an average of 300 g while the vitamin E-deficient rats gained only 200 g. Vitamin E deficiency decreased all parameters of valine transport, but did not affect transport of methyl-D-glucoside. Net transport of 3 mM valine (μmoles/500 mg tissue wet wt was 5.09 in vitamin E-deficient rats compared with a control value of 8.24; and in Vitamin E-deficient rats supplemented with *Torula* yeast, the transport was 7.45, with a control value of 12.40. Transport of 5 mM methyl-D-glucoside was 7.66 in vitamin E-deficient rats receiving *Torula* yeast, and was 6.43 in rats on the control diet. An essential fatty acid deficiency decreased both amino acid and sugar transport by decreasing the rat transfer from tissue uptake sites to the serosal medium. The net transport of 3 mM valine (μmoles/500 mg) was 4.58 in fatty acid-deficient mice, (8.84 in controls), and transport of 5 mM methyl-D-glucoside was 4.11 in fatty acid-deficient mice (5.60 in controls). Vitamin E seemingly functions at tissue uptake levels of amino acid transport while fatty acids apparently function to maintain an optimum energy supply.

6349 LEUCINE ABSORPTION RATE AND NET MOVEMENTS OF SODIUM AND WATER IN HUMAN JEJUNUM. *(E.)*

Adibi, S. A. (U. Pittsburgh Sch. Med., Pa.). *J Appl Physiol* 28(6):753-757, 1970.

The net absorption or secretion rates of leucine, mannitol, sodium and water were studied during perfusion of jejunal segments (triple-lumen tube positioned in the upper jejunum) of 5 normal adult males with test solutions containing D-mannitol or L-leucine (20 mM) or L-leucine (100 mM) in combination with sodium chloride (140 mM), or L-leucine (20 mM) in combination with D-mannitol (280 mM). With the sodium chloride concentration held constant, net absorption rates of water (μmoles/min/cm) in the same subjects were higher with leucine (120 and 17, resp.) than with mannitol (31 and 6 resp.), although the luminal flow rate (ml/min) was slightly slower during the leucine-saline perfusion (10.7 compared to 13.2). When a large intraluminal concentration of leucine (63.7 mM) was maintained, a net absorption of water and sodium against the plasma to lumen gradient was observed (and sodium absorption was less during perfusion with leucine at 100 mM than at 20 mM). Wide variations (55 and 143 mM) in sodium concentrations within the test segment and net movement of water (either absorption or secretion) did not affect the leucine absorption rate.

6350 THE ROLE OF THE PARATHYROID GLANDS IN THE ABSORPTION OF CALCIUM FROM THE SMALL INTESTINE. *(E.)*

Winter, M. (U. Med. Sch., Budapest, Hungary), E. Morava, G. Simon and J. Sos. *J Endocr* 47(1):65-72, 1970.

The influence of diet on the effects of parathyroidectomy was studied in rat duodenal and jejunal loops. Parathyroidectomy, thyroidectomy or thyroparathyroidectomy was performed surgically and the animals fed on a diet of either normal (0.6%) calcium, high (1.8%) calcium or low (0.1%) calcium. After removal of the glands, intestinal absorption of calcium was studied *in vivo* using Ca^{45}-label. Removal of either parathyroids alone or with thyroidectomy reduced absorption of calcium. Parathyroidectomy alone produced a greater decrease (from 55 to 30%) of administered calcium than the combination (55 to 40%). Ca^{45} label was given intravenously to parathyroidectomized animals to test whether reduced absorption might be due to increased calcium secretion. The results negated this hypothesis, however, for calcium content in the parathyroidectomized rats was 540 cps/min as compared to 780 cps/min in sham-operated control animals. Parathyroidectomy followed by a high calcium diet for 6 weeks revealed a similar degree of calcium absorption in comparison with a control group. Thyroidectomy by itself was also found to decrease calcium absorption although the role of the thyroid in this regard requires further study.

6351 ASYMMETRY OF OSMOTIC FLOW IN FROG INTESTINE: FUNCTIONAL AND STRUCTURAL CORRELATION. *(E.)*

Loeschke, K. (Coll. Med. U. Kentucky, Lexington), C. J. Bentzel and T. Z. Csaky. *Amer J Physiol* 218 (6):1723-1731, 1970.

The asymmetry of osmotic water flow in the adult bullfrog small intestine was investigated by volume flow measurements, transmural potentials and morphological observations. Induction of transmural osmotic volume flow across bullfrog small intestine *in vitro* by pairs of isotonic-hypotonic Na_2SO_4 Ringer solution resulted in flows of different magnitudes depending on the direction. With hypotonic solution in the mucosal and isotonic solution in the serosal fluid compartments, flow rates were 6-fold larger than when solutions were interchanged and flow direction was reversed. This asymmetry or rectification of osmotic volume flow was found by gravimetric measurements and also when flow dependent potential differences across the intestine were recorded (mean -0.17mv). When water moved from mucosa to serosa, time invariant potentials of 7.0-9.0mV, serosal side positive, were measured, whereas opposite movement demonstrated small potential differences (1.0-2.5mV) of opposite sign. Functioning tissue fixed with glutaraldehyde showed widely distended intercellular spaces during the larger mucosal to serosal flow while spaces were closed during the opposite or zero net flow. The asymmetry may be a consequence of different osmotic permeabilities of the individual barriers, located in the epithelial cell layer, involved in transepithelial water flow.

6352 THE EFFECTS OF UNSATURATED DIETARY FATS ON ABSORPTION, EXCRETION, SYNTHESIS AND DISTRIBUTION OF CHOLESTEROL IN MAN. *(E.)*

Grundy, S. M. (Rockefeller U., New York, N. Y.) and E. H. Ahrens, Jr. *J Clin Invest* 49(6):1135-1152, 1970.

The mechanism by which unsaturated fats in the diet lower plasma cholesterol was investigated with cholesterol balance studies in 11 patients with hyperlipoproteinemia (familial hypercholesterolemia or hypertriglyceridemia) fed liquid formula containing low or moderate amounts (46 to 83 mg/day or 457 to 679 mg/day, resp.) of cholesterol. Total plasma cholesterol dropped (range of 39 to 368 mg/day) over periods ranging from 8 to 49 days in 10 of the patie when unsaturated fats replaced saturated fats in the diets while the excretion of neutral steroids genera ly remained unaffected (detection sensitivity analys revealed that the sterol balance method becomes less effective in picking up significant increases in fecal steroids as the period of time over which the change occurs is lengthened); and cholesterol absorption did not change (30 to 40%) in 3 out of 5 patients tested and increased significantly (30 to 45% and 40 to 64%) in 2 patients. The changeover in diet from saturated to unsaturated fats produced no consistent effect on total cholesterol balance (difference between daily intake and excretion) with the differences ranging from a positive 293 to a negative 403 mg/day; and specific activity-time curves of plasma cholesterol following pulse labeling (50-100 μC of cholesterol-4-^{14}C or cholesterol-1,2-^{3}H) showed no change in slope indicating that cholesterol synthesis was not affected by the change in dietary fats. Unsaturated fats may cause a redistribution of cholesterol between plasma and tissue pools.

6353 EFFECT OF AMINO ACIDS ON IRON ABSORPTION FROM A STAPLE VEGETABLE FOOD. *(E.)* Martinez-Torres, C. (Venezuelan Inst. Sci. Res., Caracas) and M. Layrisse. *Blood* 35(5):669-682, 1970.

The effect of fish or amino acids present in fish on iron absorption from vegetable food was investigated using black beans (a staple food consumed in large amounts in Central and South America) as a model. The iron absorption rate in 137 subjects showed an asymmetric distribution. The mean iron absorption was 2.6% and the limit of one standard deviation was from 0.8 to 8.2%. Iron absorption from black beans (2 to 3 mg. Fe) increased about twice when the food was administered with either fish (2.2% to 4.7%) or with amino acids (1.69 to 2.9%) in number and proportion as present in 100 gm of fish. Absorption was not enhanced if the black beans were mixed with either basic, aromatic or aliphatic amino acids (including aspartic and glutamic acid). However, either cysteine plus methionine (3.1% to 8.2%), or cysteine alone (3.7 to 6.9%) enhanced iron absorption from black beans in similar proportion as observed when this food was mixed with fish or total amino acids present in fish. Cysteine may form, in the lumen of the gut, a soluble chelate with iron which facilitates iron absorption.

6354 THE COMPARATIVE TRANSPORT OF K^+ AND Rb^+ IN NORMAL AND MALIGNANT RAT TISSUES *IN VIVO* AND IN LIVER SLICES, DIAPHRAGM, AND TUMOR SLICES *IN VITRO*. *(E.)* Gilbert, I. G. F. (Inst. Cancer Res., Sutton, Surrey, England). *J Membrane Biol* 2(4):277-299, 1970.

The selectivity in the steady state uptakes of Rb^+ and K^+ was studied in normal and malignant rat tissues *in vivo* and in liver slices, diaphragm, and tumor slices *in vitro*. The selectivity was minimal in erythrocytes and the 2 fastest growing of 4 transplantable tumors and ranged towards a maximum Rb^+ uptake in liver (Rb^+: K^+ discrimination ratio: 1.04, 1.09, 1.13, and 2.27, resp.). In each tissue, the selectivity was independent of Rb^+ concentration or of K^+ deficiency (except in skeletal muscle). In liver slices *in vitro*, reduction of energy metabolism by lowering the temperature (26°C) or by the addition of metabolic inhibitors (iodoacetate, dinitrophenol, cyanide, arsenate) reduced the Rb^+: K^+ discrimination proportionately much more than K^+ transport. Diaphragm and transplantable tumor slices gave similar results. With temperature reduction there is a logarithmic relation between the Rb^+: K^+ discrimination ratio and the respiration rate of liver slices. Simultaneous diffusion and metabolically coupled transport across a homogenous membrane in which Rb^+ transport is more closely coupled than that of K^+ to a metabolic flux across the membrane probably explains the results. The tissue differences in Rb^+: K^+ selectivity apparently originate in the different levels of the coupling metabolic flux in different cell types and thus of the energy expenditure on ion transport. In contrast to the differences in steady state selectivity between Rb^+ and K^+, the initial ratio of uptakes of trace ^{43}K and ^{86}Rb, in otherwise steady state conditions, was close to unity in both liver and tumor slices, in agreement with theoretical calculations.

6355 DISTRIBUTION OF ORALLY ADMINISTERED ^{45}Ca IN RAT INTESTINAL TISSUES AND VITAMIN D_3 EFFECT. *(E.)* Moriuchi, S. (Fac. Med., U. Tokyo, Japan), T. Watanabe and N. Hosoya. *J Vitamin* 16(1):58-63, 1970.

Using young vitamin D deficient rats (body weight 60 to 80 g), the effects of vitamin D_3 and actinomycin D on the radioactive calcium distribution were studied in the intestinal mucosa and muscle 5 and 30 min after the oral administration of ^{45}Ca. Serum ^{45}Ca concentration at 30 min was increased significantly in the vitamin D_3 treated rat, and this vitamin D_3 effect was inhibited by actinomycin D (the action of vitamin D_3 and actinomycin D was not observed at 5 min). ^{45}Ca was observed in the proximal intestinal mucosa (from pyloric end to 30 cm) at 5 min, and at 30 min was found in the distal mucosa (40 to 60 cm). The concentration of ^{45}Ca in the distal mucosa (at 30 min) was enhanced with vitamin D_3 and this action was partially inhibited by actinomycin D. ^{45}Ca in muscle was lower than in mucosa, and the distribution patterns were quite similar to the mucosal patterns. In the duodenal mucosa nuclei and cell debris (brush borders) ^{45}Ca was distributed in high concentration 5 min after administration whereas at 30 min ^{45}Ca of the subcellular fraction was significantly decreased, especially in nuclei, cell debris and mitochondria. This reduction was moderated by vitamin D_3 and actinomycin D inhibited this vitamin D_3 action in microsomes and supernatants. Calcium transport may involve a membrane permeable system (actinomycin D insensitive) and a system involving calcium carrier protein (actinomycin D sensitive).

6356 STUDIES ON HOG INTRINISC FACTOR: III. IMMUNOLOGIC EVIDENCE SUGGESTING THE ABSORPTION OF HOG INTRINSIC FACTOR FROM HUMAN INTESTINE. *(E.)* Inada, M. (Fac. Med. Kyoto U., Japan). *J Vitamin* 16(1):25-30, 1970.

One g of raw hog intrinsic factor (IF) was administered orally to each of 10 control subjects with no hematological disorders, 3 pernicious anemia patients, and 3 total gastrectomy patients. Eight hr later a vitamin B_{12}-binding substance from raw hog IF was detected, by radioimmunodiffusion technique, in the sera and urines of 7 control subjects. The sensitivity of the technique would indicate that immunoreactive hog IF equivalent to bind 5.0 μg/ml of hog IF existed in the control sera of positive cases. In the remaining 3 control subjects and in all cases with pernicious anemia or with total gastrectomy, the substance was not found in their sera and urines either before or after the oral administration of raw hog IF. Based on the finding that the detected substance was immunologically identified with the purified hog IF, it was concluded that "immunoreactive hog IF", or rather hog IF or its split fragment, was absorbed from human intestine.

6357 INFLUENCE OF SUCCINIC ACID ON ABSORPTION OF IRON STUDIED BY WHOLE-BODY MONITORING. *(E.)* Will, G. (Gateside Hosp., Greenock, Scotland) and K. Boddy. *Amer J Clin Nutr* 23(6):779-781, 1970.

Nineteen symptomless, nonanemic adult male volunteers were given two 10-day courses of oral ferrous succinate (each dose containing 37 mg elemental iron), one course being given with added free succinic acid and the other without, to determine if successive, rather than single, doses of succinic acid were effective in increasing whole-body absorption of iron. Labeling with 0.1 to 0.2 μC ^{59}Fe/dose enabled measurement of iron absorption (a whole-body monitor was used). The mean absorption and standard error of 37 mg iron as ferrous succinate alone was 5.7% with a range of 2.6 to 10.0%. The corresponding figures for the same dose of ferrous succinate given with 110 mg free succinic acid were virtually the same: mean and standard error, 5.7% with a range of 1.9 to 9.6%. In 9 subjects in whom the red cell incorporation of iron was measured, iron utilization was not increased by the addition of free succinic acid.

6358 STUDIES IN CARBOHYDRATE-INDUCED HYPERTRIGLYCERIDEMIA: ASPECTS OF FRUCTOSE METABOLISM. *(E.)* Kaufmann, N. A. (Hadassah U. Hosp., Jerusalem, Israel), J. Kapitulnik and S. H. Blondheim. *Israel J Med Sci* 6(1):80-85, 1970.

Blood levels of fructose, glucose, pyruvate, lactate and serum triglyceride were reported in 11 normal subjects and 8 patients with hypertriglyceridemia, after administration of an oral fructose load (1 g/kg). Serum fructose increased from about 5 mg/100 ml to 15 mg/100 ml in both normal and hyperglyceridemic patients. No differences in glucose, pyruvate or lactate changes were found between normals and patients. Both groups exhibited a transient decrease in serum triglycerides (mean 8.5 mg/100 ml in normals and mean 60.5 mg/100 ml in patients). However, the decrease relative to initial fasting triglyceride levels was about the same in both groups. From these results, intestinal absorption of fructose appears to be normal in patients with carbohydrate-induced hypertriglyceridemia.

MOTILITY

8 ELECTRICAL STIMULATION OF ISOLATED GUINEA PIG ILEUM. *(E.)* Scriabine, A. (Merck Inst. r. Res., West Point, Pa.) and G. J. Perlak. *J l Physiol* 28(6):860-862, 1970.

ifications of the technique of coaxial electrical mulation of isolated guinea pig ileum included stimulating electrodes with a fixed platinum wire, Multi-Pulser, a solid-state unit, designed to iver pulses generated by a stimulator simultansly to 6 isolated tissue preparations without lection of electrical loads back to the waveform rce. At the stimulation frequency of 0.1/sec, isolated ileum usually developed a slight ascend- staircase phenomenon. There was no statistically nificant change in the strength of contraction h the increase in the rate of stimulation from (1.89 g) to 0.4/sec (1.62 g). At the 0.1/sec quency the response to electrical stimulation ained stable for 1 hr. In experiments with glucose- e medium, addition of glucose (0.4 to 1.5 mg/ml) nificantly increased the force of contractions. gs known to depress the release of acetycholine rphine and tetrodotoxin) antagonized electrically induced contractions of isolated guinea pig ileum. In pharmacology, this technique is apparently useful in evaluating drugs which, like morphine, block the release of acetylcholine from the tissue without antagonizing the spasmogenic effects of exogenous acetylcholine.

6379 EFFECT OF SECRETIN AND CHOLECYSTOKININ ON GASTRIC EMPTYING AND GASTRIC SECRETION IN MAN. *(E.)* Chey, W. Y. (Temple U. Hlth. Sci. Ctr., Philadelphia, Pa.), S. Hitanant, J. Hendricks and S. H. Lorber. *Gastroenterology* 58(6):820-827, 1970.

The effects of secretin and cholecystokinin on gastric emptying (% emptying at 15 min) and on gastric acid secretion (mEq/5 min) stimulated by pentagastrin (0.12 μg/kg/hr iv.) or histamine (0.02 mg/kg/hr iv.) were determined in 21 fasted patients (2 with duodenal ulcers and 2 with a history of chronic pancreatitis although all 4 were asymptomatic at the time of the study). Secretin (1 U/kg i.v.) reduced gastric emptying from 85% to 41% and cholecystokinin (0.5 U/kg i.v.) reduced it from 80% to 44% while saline controls in 2 separate experiments averaged 85%. Pentagastrin-stimulated gastric secretion dropped from approximately 1.6 to 0.65 within 5 min of secretin administration (1 U/kg) and remained significantly depressed for 30 min, while histamine-stimulated secretion dropped from approximately 2.4 to 1.9 within 5 min of the secretin administration (1 U/kg) and dropped further to 1.1 after 15 min although the inhibition was no longer significant after 20 min; but when higher doses of pentagastrin (6 μg/kg/hr) or of histamine (0.04 mg/kg/hr) were used to stimulate acid secretion, secretin produced no significant inhibition. Cholecystokinin lowered the pentagastrin-stimulated secretion from 2.0 to 1.5 within 5 min with a maximal effect observed after 15 min (0.8) and with significant inhibition for 30 min, and lowered the histamine-stimulated secretion from 2.5 to 2.0 after 5 min although significant inhibition lasted only 15 min.

6380 THE SIGNIFICANCE OF THE ABDOMINAL ESOPHAGUS IN THE CLOSING MECHANISM OF THE ESOPHAGOGASTRIC JUNCTION. AN EXPERIMENTAL STUDY.

(Ger.) Kralik, J. (1st Surg. Clin. Palacky U., Olomouc, Czechoslovakia). *Thoraxchirurgie* 18(3):207-214, 1970.

Experiments in dogs were performed to test the possibility of maintaining a pressure barrier between the stomach and thoracic esophagus, under conditions of a non-functioning sphincter. In 9 dogs a left lateral thoracotomy was followed by separation of the phreno-esophageal membrane, the stomach and the upper part of the duodenum were pulled up into the left pleural cavity, and a pyloroplasty was carried out, after which a separation of the esophagus close to the cardia was effected, and closed. The large curvature in the cardiac end of the stomach was separated and a tube was inserted between this and the esophagus. The stomach was then replaced into the abdominal cavity and the terminal esophagus was resected and an anastomosis made with the stomach tube. After 14 days, the animals were able to eat normally. Difficulties in swallowing appearing during the first 2 post-operative weeks indicate esophageal reflux, and 3 dogs were thus eliminated (2 with bilateral pleural empyema, and one animal had to be sacrificed because of an excessively wide tube, causing mechanical difficulties). Of the 6 surviving animals, 2 suffered post-operative reflux, both due to a faulty construction of the tube (two too short, one too wide an opening of the cardia). The other 4 animals showed no signs of esophageal reflux. Another method for the reconstruction of the esophageal junction was applied in 8 dogs, in which left lateral thoracotomy was followed by bringing together the phrenoesophageal membrane and the adjoining peritoneum with the esophagus perimeter. A corner of the gastric fundus and the anterior surface of the esophageal gastric connection were pulled up into the pleural cavity, and myotomy of the terminal esophagus was effected. The corner of the gastric fundus was sutured into the large muscle slit in such a manner that the gastric serosa were brought close to the esophageal mucosa, thus hindering the coalescence of the myotomy. The pyloroplasty accomplished, the organs were replaced into the peritoneal cavity, and the left hiatal edge sutured to the esophagus. This "patch" method was successful in the attempt to reconstruct the esophagogastric junction.

6381 EFFICIENCY OF AN ANTIPERISTALTIC INTERPOSED SMALL BOWEL LOOP IN RELATION TO ITS LOCALIZATION.

(Ger.) Schima, E. (Surg. U. Clin. Vienna, Austria). *Langenbeck Arch Chir* 326(2-3):212-215, 1970.

An antiperistaltic interposition of 2 to 3 cm of the small bowel was made in colectomized rats either in the lowest ileum or in the middle of the small intestine. In control animals, the small segment was excised and then inserted in an *iso*peristaltic position. The mean bowel transit time in controls was 3.7 hr and 6.2 and 6.0 hr in the experimental animals. Since there was no difference in the retardation of the bowel transit time regardless of the location of the antiperistaltic segment, the braking effect appears to be limited to a portion of the bowel above the interposition.

6382 THE EFFECT OF VAGOTOMY ON FLOW RESISTANCE AT THE CHOLEDOCHO-DUODENAL JUNCTION. AN EXPERIMENTAL STUDY IN THE ANESTHETIZED CAT.

(E.) Liedberg, G. (Dept. Surg., U. Lund, Sweden) and M. Halabi. *Acta Chir Scand* 136(3):208-212, 1970.

Young cats (10) of both sexes were used in this study of the effects of vagotomy on the choledocho-duodenal sphincter. The resistance to continuous perfusion of the sphincter of Oddi with saline was measured in anesthetized animals before and after vagotomy with recordings made under basal conditions and after the injection of cholecystokinin (CCK). In 1 cat the effect of i.v. injection of the C-terminal octapeptide of CCK was observed. The damped curve showed only very small oscillations due to the influence of respiration and cyclic sphincter activity (about 4 to 5 cycles/min) and slow irregular waves representing the mean sphincteral resistance. Increased duodenal activity clearly raised the resistance. In all 10 cats i.v. injection of CCK (dose about 1 unit/kg) stopped the activity of the sphincter for 10 to 15 min. The injection clearly reduced the resistance to flow in 7 cats, including 2 in which the reduction was preceded by a transient increase due to strong duodenal contractions. Vagotomy had no influence on the rhythmical sphincter activity. All common duct pressure changes after vagotomy were slight and transient. The flow resistance always returned to the pre-vagotomy level within 15 to 20 min. In none of the cats was vagotomy followed by any change in the response to CCK. The injection of $0.7x10^{-4}$ mg of C-terminal octapeptide of CCK had an effect similar to that of 2 U CCK. The findings do not suggest any pumping mechanism in the sphincter. The response of the sphincter to physiological stimuli e.g. feeding, in the unanesthetized animal before and after vagotomy still is unknown.

SECRETION AND METABOLISM

Stomach

392 SITE OF ORIGIN OF THE HORMONE RESPONSIBLE FOR GASTRIC HYPERSECRETION ASSOCIATED WITH RTACAVAL SHUNT. *(E.)* Orloff, M. J. (U. California h. Med., San Diego), H. Villar-Valdes, A. G. bott, R. J. Williams and H. Rosen. *Surgery* (1):202-208, 1970.

is study is an attempt to localize the site of igin of the intestinal phase hormone responsible r gastric hypersecretion associated with portaval shunt. Dogs (24) prepared with Thiry-Vella ops of jejunum, ileum or colon and with portaval shunts were used in the investigation. Stanrd test meals instilled into the isolated segments re employed to stimulate secretion and the volume d acid content from Heidenhain pouches measured. sal secretion (1.10 to 1.40 ml/hr) increased maredly (10.50 to 16.84 ml/hr) in response to food in e isolated jejunal pouch and basal acidity (0.10 0.13 mEq/hr) increased to 1.18 to 2.04 mEq/hr. e secretory response to ileal installation of the st meal was minimal (0.79 to 1.44 ml/hr to 4.65 5.29 ml/hr) as was the acid response. Installaon of food into the isolated colon did not stimute gastric secretion either with or without rtacaval shunt. The jejunum therefore appears to the main site of the hormone responsible for the intestinal phase of gastric secretion and for the hypersecretion associated with portacaval shunt.

6393 IMMUNOCHEMICAL MEASUREMENT OF THE VAGAL RELEASE OF GASTRIN. *(E.)* Jaffe, B. M. (Washington U., Sch. Med., St. Louis, Mo.), J. E. McGuigan and W. T. Newton. *Surgery* 68(1):196-201, 1970.

The measurement of gastrin following vagal stimulation by insulin (0.7 unit/kg, i.v.) was made in an attempt to confirm and categorize the vagal release of this hormone. Stamm gastrostomies were performed in 7 dogs (12.8 to 17.8 kg) under light pentobarbital anesthesia and Levin tubes passed and positioned. Peripheral venous samples were analyzed for blood glucose and portal vein samples withdrawn for serum gastrin analysis by radioimmunoassay. Initial blood glucose levels (54 to 100 mg%) fell to between 15 to 43 mg% after 1 hr following insulin administration, and acid secretion rose from an initial 0.12 mEq/hr to 0.64 mEq/hr after stimulation. Gastrin from portal blood first increased at a mean 25 min after insulin administration and there appeared to be a specific blood glucose level of 34 to 55 mg% (43 mg%) at which gastrin was first released. Basal portal vein gastrin levels of 20 pg/ml or less rose to a mean peak concentration of 225 pg/ml. Vagal release of gastrin has thus been documented by direct measurement of the hormone.

6394 BASAL AND HISTAMINE-INDUCED GASTRIC ACID AND PEPSIN SECRETION IN THE CONSCIOUS MINIATURE PIG.

(E.) Merritt, A. M. (Sch. Vetr. Med., Kennett Square, Pa.) and F. P. Brooks. *Gastroenterology* 58(6):801-814, 1970.

Examination was made of the porcine stomach in relation to its basal gastric secretion and maximal secretory potential. Female miniature swine between 8 and 26 weeks of age were fitted surgically with a gastric cannula and chronic intravenous catheter. Volume, pH and acid output during the interdigestive secretory period and the gastric response to histamine (0.12 to 4.0 μg/kg, i.v) were measured in 6 dogs and, in addition, body weight was followed as an index of growth and to normalize the output data. The average acid output during basal secretion was 0.240 mEq/kg/hr and the output pattern was unpredictable in that marked changes during collection periods were not unusual. The pepsin output generally corresponded with acid output. Maximal acidity was achieved with histamine doses between 1.0 and 4.0 μg/kg/min and the mean output averaged 1.409 mEq/kg/hr. The mean pepsin response was also maximal at doses of 1.0 μg/kg/min or above. No significant differences were found between the histamine response of animals weighing under 8 kg and the same pigs between 14 to 18 kg at a later date. The fundal mucosal weight of the miniature pigs was concluded to be an accurate index of their parietal cell mass.

6395 BASAL AND HISTAMINE-STIMULATED HUMAN GASTRIC ACID SECRETION.

(E.) Winship, D. H. (Marquette Sch. Med., Milwaukee, Wisc.) and G. C. Bernhard. *Gastroenterology* 58(6):762-765, 1970.

The effect of indomethacin administration (75-100 mg/day p.o.) for 1 month on gastric acid secretion was determined using the augmented histamine test of Kay on 22 patients with arthritic diseases (classic rheumatoid arthritis, osteoarthritis, Reiter's syndrome, or ankylosing spondylitis) and on 11 normal subjects. In arthritic patients the basal acid output (mEq/hr) and the peak acid output (mEq/hr) were 0.7 and 13.7, resp., before treatment and 0.9 and 15.1, resp., after treatment, while in normal subjects the basal and peak outputs were 0.9 and 17.6, resp., in the first test and 1.5 and 20.4, resp., in a second test run 3 to 6 weeks later. No significant differences are apparent in either group.

6396 THE ACUTE EFFECT OF VARIOUS PHARMACOLOGICAL SUBSTANCES UPON ACID SECRETION IN RESPONSE TO GASTRIC STIMULATION IN THE HUMAN.

(Ger.) Mertz, D. P. (Med. Polyclin. U. Freiburg, Germany), T. Wick, T. Thongbhoubesra and C. Walloschek. *Klin Wschr* 48(13):821-822, 1970.

Experiments in humans without organic lesions of the gastric mucosa are described in which the influence of an intravenous injection of 170 mg 7-(β-hydroxyethyl) theophylline and 100 mg theophylline, of 300 mg 1-(β-hydroxypropyl)-theobromine, of 10 mg phentolamine, of 25 mg prednisolone, of 8 mg oxyfedrine and of the beta-adrenergic blocking agent LB46, resp., on gastric acid secretion has been measured during maximal stimulation with histalog. Gastric acid secretion has been found to be increased (24%) after injection of prednisolone and phentolamine due to an enhancement of the volume rate. The other substances did not alter significantly the gastric acid output. Cyclic 3',5'-AMP may play a part in the secretory mechanism of gastric acid.

6397 GASTRIN: OBLIGATORY INTERMEDIATE FOR ACTIVATION OF GASTRIC HISTIDINE DECARBOXYLASE IN THE RAT.

(E.) Aures, D. (VA Hosp., Sepulveda, Calif.), L. R. Johnson and L. W. Way. *Amer J Physiol* 219(1):214-216, 1970.

The role of endogenous gastrin in the activation of gastric mucosal histidine decarboxylase (assayed by the method of Aures and Clark) was studied in antrectomize (removes main source of gastrin) and normal rats. Histidine decarboxylase activity (pmoles CO_2/mg tissue) dropped from 0.9 in sham-operated animals to 0.2 in antrectomized animals after bethanechol administration (10 mg/kg i.p.) and fell to nonmeasurable levels from 2.1 and 1.1 after insulin (4U/kg i.p.) and 2-deoxy-D-glucose (200 mg/kg i.p.), resp. Substances structurally similar to gastrin, pentagastrin (250 mg/kg i.p.) and cholecystokinin (75 U/kg i.p.) produced similar hi tidine decarboxylase activities in both the sham-operated and antrectomized rats (1.4 and 1.3, resp. with pentagastrin and 1.2 and 1.1, resp. with cholecystokin although saline injection produced only very low activ ity (0.4) in the sham-operated rats and nondetectable activity in the antrectomized rats. Gastrin and struc turally similar substances may be responsible for histidine decarboxylase stimulation.

6398 RESPONSE TO DUODENAL ACIDIFICATION IN MAN: II. EFFECTS ON THE GASTRIC SECRETORY RESPONSE TO PENTAGASTRIN.

(E.) Wormsley, K. G. (Roy. Infirm., Sheffield, England). *Scand J Gastroent* 5(3):207-215, 1970.

The effects of infusion of hydrochloric acid (10 or 11 mEq) into the duodenum on gastric secretory response to pentagastrin (0.2 μg/kg/hr i.v.) were determined in 4 normal subjects and in 22 patients with indirect inguinal hernia, duodenal ulcer, or gastric ulcer. Reflux into the stomach from the duodenum was not significantly different in any of the groups and was not correlated to the response to pentagastrin. All the subjects had steady responses to pentagastrin alone and there were no significant differences from control levels (range 7.5 to 26 mEq/30 min) in the overall acid outputs when acid was infused over a 30 min period (range of 8 to 25 mEq/30 min) although there was a decrease when acid was infused over a 10 min period (range of 0 to 27 mEq/30 min) ; but gastric acid secretion was depressed below the control levels during the acidification periods (range of 0 to 25 mEq/30 min) efore returning to the higher levels (pepsin output ollowed the same patterns). The overall acid esponse to secretin (0.25 U/kg/hr i.v.) was less han to acidification (14.0 and 15.1 mEq/30 min, esp.) and the overall pepsin response to secretin as higher than to acidification (35.75 and 33.05 /30 min, resp.).

SECRETION AND METABOLISM

Pancreas

409 PANCREOZYMIN BIOASSAY IN MAN BASED ON PANCREATIC ENZYME SECRETION: POTENCY OF PECIFIC AMINO ACIDS AND OTHER DIGESTIVE PRODUCTS. E.) Go, V. L. W. (Mayo Clin., Rochester, Minn.), . F. Hofmann and W. H. J. Summerskill. *J Clin nvest* 49(8):1558-1564, 1970.

hysiologic intraduodenal concentrations of saline, extrose, micellar fatty acid, an amino acid mixure, and various essential and nonessential amino cids were perfused through the stomachs and duoenums of 45 healthy volunteers and outputs of pancreatic lipase, trypsin, and amylase were determined. nzyme outputs (represented by trypsin U x 10^3) in response to perfusion during the second hr with dextrose (1.75) was not significantly different from the saline control (1.2) while fatty acid (3.4) and the amino acid mixture (5.6) perfusates significantly raised the trypsin outputs. Pancreozymin (0.35 U/kg/min i.v.) was infused while perfusion with saline was maintained and the trypsin output was measured (28.0). A mixture of essential amino acids in the perfusate caused a trypsin output (24.2) similar to that of the pancreozymin but a mixture of nonessential amino acids evoked no greater output (7.8) than the saline control, and individually the essential amino acids (phenylalanine, valine, and methionine) evoked outputs (12.3, 8.4, and 8.1, resp.) only slightly greater than the saline controls while the other amino acids tested (tryptophan, isoleucine, leucine, lysine, and threonine) produced saline-like responses. Perfusion with the original amino acid mixture at various concentrations (18, 182, and 272 mM) produced similar results (16.4, 17.4, and 16.5) and i.v. infusion of the original mixture produced a trypsin output (8.5) similar to that achieved with the saline control

6410 • PANCREATIC ENZYME PATTERN IN RATS AS AFFECTED BY DIETARY SOYBEAN FLOUR. *(E.)*

Konijn, A. M. (Hebrew U. Hadassah Med. Sch., Jerusalem, Israel), Y. Birk and K. Guggenheim. *J Nutr* 100(3):361-368, 1970.

Adaption of the exocrine pancreatic enzymes to soybean flour was studied in male rats fed diets containing heated or unheated soybean flour. The animals were fed their respective diets for 3 weeks and following an 18-hr period of either fasting or continued feeding, were sacrificed, the pancreas was removed and weighed, and tryptic and chymotryptic enzyme assays were determined. The pancreas of rats fed diets with unheated soybean flour and then fasted had an amylolytic activity of 1410 U, a tryptic activity of 241 U and a chymotryptic activity of 3488 U, while the pancreas of rats receiving heated soybean flour and then fasted showed amylolytic activity of 2640 U, a tryptic activity of 164 U, and chymotryptic activity of 155 U. Lipase and esterase activities were similar for these two groups. In the pancreas of fed rats adapted to heated soybean flour, the lipolytic activity (457 U) and the esterolytic activity (1004 U) were higher than in those fed rats adapted to unheated soybean flour, which had a lipolytic activity of 117 U and an esterolytic activity of 239 U. More amylase was found in the pancreas of rats adapted to heated soybean flour than in those adapted to unheated soybean flour, and amylase activity was greater in the pancreas of fasted rats than in the fed rats. Tryptic and chymotryptic activities in unfasted rats were not affected by diet. Diets containing unheated soybean flour induced a response of the pancreas similar to that elicited by pancreozymin. Fractionation of pancreatic extracts showed that the total protein content of anionic proteins (carboxypeptidases A and B, trypsinogens I and II, chymotrypsinogen and procarboxypeptidases A and B) was significantly lower in the pancreas of rats fed unheated soybean flour than in those receiving heated soybean flour, and was more enhanced in the nonfasted than in the fasted state.

6411 PANCREATIC DOSE-RESPONSE CURVES TO INTRAVENOUS SECRETIN IN MAN. *(E.)*

Konturek, S. J. (Med. Acad. Cracow, Poland). *Gastroenterology* 58(6):828-832, 1970.

Volume, bicarbonate concentration and bicarbonate output of duodenal content were measured after the infusion of secretin in successively increasing doses (0.1, 0.3, 0.9 and 2.7 U/kg i.v.) and the resulting dose-response curves were compared to those obtained after single rapid injections (i.v.) in 6 volunteer women. All 3 parameters rapidly rose immediately following the start of infusion (0.1 U/kg/hr) in all the subjects with the mean maximal bicarbonate output (12 mEq/30 min) and the highest bicarbonate concentration (87 mEq/l) reached at a dose of 0.9 U/kg/hr, and the volume plateauing (73 ml/15 min) at the highest dose tested (2.7 U/kg/hr). Single rapid injections immediately raised the 3 parameters with the mean maximal bicarbonate output (11 mEq/30min) and the highest bicarbonate concentration (95 mEq/l) occurring at 0.9 U/kg and the volume maximum (63 ml/15min) at 2.7 U/kg. Both dose-response curves are similar and there is no statistical difference in the 30 min peak volume and bicarbonate output whether secretin is infused continuously or injected in single doses.

6412 SIGNIFICANCE OF CYCLIC AMP IN THE REGULATION OF EXOCRINE PANCREAS SECRETION. *(E.)*

Knodell, R. G. (U. Pennsylvania Med. Sch. Hosp., Philadelphia), P. P. Toskes, H. A. Reber and F. P. Brooks. *Experientia* 26(5):515-517, 1970.

The effects of bathing rabbit pancreas with N^6-2-0-dibutyryl cyclic adenosine-3'5'-monophosphate (DcAMP) and theophylline singly and in combination on trypsin and chymotrypsin concentration, and output (determine by titrating hydrolysates) and volume were determined Control values for trypsin concentration (52.3) and output (56.0), for chymotrypsin concentration (57.2) and output (62.8), were significantly increased when DcAMP (1×10^{-5}M) was added (98.6, 107.2, 96.4, and 104.9, resp.), when theophylline (1×10^{-2}M) was added (99.7, 127.8, 101.0, and 129.5, resp.), and when DcAMP (1×10^{-5}M) and theophylline (1×10^{-3}M) were added in combination (85.8, 114.0, 79.2, and 110.8, resp.). Theophylline alone (1×10^{-3}M) significantly increased only trypsin output (97.1), and all the additions except DcAMP alone significantly increased the volumes from the control value (105.0).

6413 THE INFLUENCE OF SODIUM TAUROCHOLATE ON TH PANCREATIC LIPASE-SUBSTRATE ADSORPTION AND ACTIVITY. *(E.)*

Schoor, W. P. (Louisiana St. U. Med. Ctr.) and P. Melius. *Biochim Biophys Acta* 212(1):173-175, 1970.

The role of sodium taurocholate in pancreatic enzyme-substrate interaction and enzymatic lipolytic activity was investigated using a Sephadex G-200 treated water-soluble preparation of porcine pancreatic lipase. One unit of enzymatic activity was equal to the amount of enzyme that would liberate 1 μEq of fatty acid per min from olive oil and diolein, as determined by NaOH titration. Adsorption activity was measured in assay solutions with added enzyme (26 U) which were centrifuged for 30 min at 100,000 X *g*. Adsorbed and unadsorbed activities were defined as those found after centrifugation in the olive oil top part and in the aqueous bottom part of the tube, resp. The amount of sodium taurocholate did not significantly affect the adsorption of the enzyme to the substrate surface. Enzymatic lipolytic activity increased linearly with increased sodium taurocholate concentration and reached maximum of 25 U activity with a 33 mM substrate concentration and a sodium taurocholate concentration of 3.0 mM.

maximum was reached for each substrate concentra-
ion (range: 3.3 to 33 mM), but there was no simple
elation between the maxima and the amount of sub-
trate. The adsorption of pancreatic lipase was
eversible and was not dependent upon the sodium
aurocholate concentration, while the lipolytic
ctivity was dependent upon it.

SECRETION AND METABOLISM

Hepatobiliary Tract

419 METABOLISM OF GLYCOCHOLIC ACID IN MAN. *(E.)* Norman, A. (Danderyds' Hosp., Sweden).
cand J Gastroent 5(3):231-236, 1970.

he metabolism of glycocholic acid was studied by
solating labeled conjugates (ethyl acetate and bu-
anol extractions and column chromatography) from
ile of patients (with normal enterohepatic circu-
ation) given 24-^{14}C-cholyl-1-^{14}C-glycine (6 μC p.o.).
fter 25 to 26 hr, 43 to 75% of the isotope in the
ile acids was present as double-labeled glycoholic
cid and dropped to 5 to 6% after 73 to 74 hr. When
holyl-1^{14}C-glycine (5 μC p.o.) was given to two
atients, only 0.3 to 0.5% of the isotope was pre-
ent as glycodeoxycholic acid with the remaining as
lycocholic acid after 24 to 26 hr. Bile acids are
leconjugated as they pass through the intestinal
ract and unconjugated cholic acid appears to be the
rincipal substrate for 7α-dehydroxylation.

420 A STUDY OF SOME POSSIBLE MECHANISMS BY WHICH MAGNESIUM ACTIVATES HEPATIC MICROSOMAL DRUG
ETABOLISM *IN VITRO*. *(E.)* Fouts, J. R. (Coll. Med. U.
owa, Iowa City) and M. A. Peters. *J Pharmacol Exp*
her 173(2):233-241, 1970.

Livers from male rats pre-treated with chlortetracycline (50 mg/kg i.p. daily for 5 days) or phenobarbital (75 mg/kg/day i.p. for 3 days), or nothing at all, were used to study some possible mechanisms of activation of hepatic microsomal drug metabolism *in vitro* by magnesium ion. The activities of microsomal reduced nicotinamide adenine dinucleotide phosphate (NADPH) oxidase, NADPH-cytochrome c reductase and cytochrome P-450 reductase enzymes were increased in the Mg^{++} activated suspensions. There was also a slight but consistent alteration in the substrate P-450 interaction as seen by a change in the spectral dissociation constant with benzphetamine (type I substrate) but not with aniline (type II substrate). A study of enzyme kinetics showed that Mg^{++} caused an increase in both the Km and V_{max} with benzphetamine as the substrate, but with aniline as the substrate only V_{max} was increased with no change in the K_m. High concentrations of Mg^{++} (50 mM) inhibited microsomal NADPH oxidase but only further increased microsomal NADPH-cytochrome c and P-450 reductase activities. High concentrations of Mg^{++} appeared to offer *in vitro* conditions where cytochrome P-450 reductase was not the rate-limiting step in certain drug metabolisms by hepatic enzymes.

6421 EFFECT OF NICOTINAMIDE ON THE REGULATION OF CARBOHYDRATE METABOLISM IN RAT LIVER.

(E.) Talke, H. (Med. U. Clin., Freiburg, Germany), J. Keller and F. W. Schmahl. *Horm Metab Res* 2(3):147-152, 1970.

The effect of a decreased fatty acid supply following nicotinamide injection (500 mg/kg, i.p.) on the carbohydrate metabolism in rat liver *in vivo* was investigated. After injection the ratios of lactate/pyruvate, glycerol-1-phosphate/dihydroxyacetonephosphate and malate/oxaloacetate decreased (from 11.0, 6.4, and 77 to 7.1, 3.7, and 44, resp.) leading to a more positive redox state of the cytosolic nicotinamide adenine dinucleotide system. The changes of these ratios are probably related to a diminished supply of fatty acids to the liver as a consequence of lipolysis inhibition. Accumulation of nicotinamide adenine dinucleotide had no effect on the redox state of the cytosolic NAD system. The sums of the redox pairs, lactate + pyruvate, glycerol-1-phosphate + dihydroxyacetonephosphate and malate + oxaloacetate decreased (from 1270, 240, 340 nmole/g to 715, 160, and 165 nmole/g, resp.) in treated animals. These decreases together with an increased glycogenolysis (glycogen content decreased from 262 to 33 µmole glucose/g liver) seem to be related to a lack of substrates, possibly as a consequence of inhibition of gluconeogenesis.

6422 CORTISONE INDUCED GLUCONEOGENESIS IN RAT LIVER: ENZYME ACTIVITIES AND SUBSTRATE CONCENTRATIONS.

(Ger.) Stormer, B. (Inst. Physiol. Chem. U. Dusseldorf, Germany), W. Janssen, H. Reinauer, W. Staib and S. Hollmann. *Hoppe-Seyler Z Physiol Chem* 351(3):296-304, 1970.

Gluconeogenesis was studied in fed and starved male rats, which were hydrocortisone treated (5 mg/100 g body wt i.p., single dose), betamethasone treated (5 mg/100 g body wt i.p., single dose), or adrenalectomized. Blood sugar and metabolite levels in the liver as well as enzyme activities (liver) were determined in samples taken 6 hrs after treatment. Liver acetyl-CoA (23 nmoles/g) increased with starvation in normal animals (55 nmoles/g) and in adrenalectomized animals (34 nmoles/g). Starvation also increased pyruvate carboxylase activity (0.0252 U/mg protein vs 0.0167 U/mg protein) and phosphopyruvate carboxylase activity (0.130 U/mg protein vs 0.038 U/mg protein) in both normal and adrenalectomized animals and decreased pyruvate kinase (18.1 U/g ml vs 61.3 U/g) and blood sugar levels (80 mg/100 ml vs 111 mg/100 ml). Glucocorticoid induced an increase in blood sugar levels (139 mg/100 ml) and liver glycogen content (4.5 mg/g vs 1.06 mg/g in starved animals) and a decrease in pyruvate kinase activity (0.148 U/mg protein vs 0.36 U/mg protein) and slightly increased pyruvate carboxylase (21.3 U/g vs 20.1 U/g in starved animals and 6 U/g in control animals). Since glucocorticoid administration led to decreased acetyl-CoA (34 nmole) when compared to the starved specimens and decreased the lactate/pyruvate ratio while increasing pyruvate kinase and pyruvate dehydrogenase activities, these factors should be excluded as effectors of glucocorticoid induction of gluconeogenesis in starvation.

6423 FACTORS INVOLVED IN CHANGES IN HEPATIC LIPOGENESIS DURING DEVELOPMENT OF THE RAT.

(E.) Lockwood, E. A. (Dept. Biochem., U. Sheffield, England), E. Bailey and C. B. Taylor. *Biochem J* 118(1):155-162, 1970.

Changes in the livers of developing Wistar rats from late fetal life to maturity were followed by measuring the activities of acetyl-CoA-carboxylase, phosphofructokinase, aldolase, extramitochondrial aconitate hydratase and NADP-dependent isocitrate dehydrogenase. Also studied was the effect of altering the weaning time on some enzymes associated with lipogenesis. Weaning rats at 15 days of age instead of 21 days produced an immediate increase in the activity of malic enzyme whereas the activities of glucose-6-phosphate dehydrogenase and ATP citrate lyase did not increase until 4 or 5 days and acetyl-CoA carboxylase 2 or 3 days after early weaning. Weaning rats on to an artificial-milk diet led to a complete repression of the rise in activity of hepatic enzymes associated with lipogenesis normally found on weaning, except for malic enzyme which increased in activity after 20 days. The i.p. injection of thyroxine produced a 20-fold increase in malic enzyme activity and a 2-fold increase in ATP citrate lyase activity; glucagon, cortisol and growth hormone had no effect. The activities of hepatic glucose-6-phosphate dehydrogenase and malic enzyme were higher in adult female than in adult male rats which is due to both male and female sex hormones.

6424 A COMPARATIVE STUDY OF RNA SYNTHESIS IN RAT HEPATIC NUCLEI AND MITOCHONDRIA UNDER THE INFLUENCE OF CORTISONE.

(E.) Yu, F. L. (Coll. Physicians Surgeons, Columbia U., New York, N.Y.) and P. Feigelson. *Biochim Biophys Acta* 213(1):134-141, 1970.

The nature of RNA synthesis in hepatic nuclei and mitochondria was studied in adrenalectomized male rats given cortisone acetate (5 mg/100 g i.p.) 10 min or 4 hr prior to sacrifice and also a mixture of 200 µC 5-^{3}H-uridine (U) and 40 µC 8-^{14}C-guanine (G) given i.p. 10 min prior to sacrifice. Specific activity measurements 10 min after cortison treatment indicated that the U/G base labeling ratio of the RNA in all cellular fractions was elevated relative to controls as a consequence of a concurren stimulation of U-rich RNA synthesis and a diminution of G-rich RNA synthesis. The U/G base labeling ratio of the hepatic RNA of all fractions was shifte downward 4 hr after cortisone treatment, with a 10 min pulse labeling period, as a consequence of enhancement of G-rich ribosomal precursor RNA synthesis in the nucleus. A 10 min cortisone treatment stimulated mitochondria to actively synthesize U-ric RNA, but there was no reversal of the RNA labeling pattern 4 hr after hormone treatment, as indicated by an unchanged high U/G base labeling ratio. It was concluded that the mitochondrial ribosomal RNA genome is under a different mechanism of control than its nuclear counterpart. After a 10 min pulse incorporation the U/G base labeling ratio of the RNA species was low in nuclei and high in cytoplasm, indicating that U-rich RNA synthesized in nuclei was rapidly transported into the cytoplasm leaving behin

he immature G-rich ribosomal RNA, whereas mitochondria
etained their U-rich RNA. The U/G ratios of the
cid-soluble precursor pools were relatively insensi-
ive to cortisone both in nuclei and mitochondria
fter either 10 min or 4 hr of hormonal treatment.

425 INHIBITION OF HEPATIC GLUCONEOGENESIS
AND FATTY ACID OXIDATION BY PENT-4-ENOIC
CID. *(E.)* Ruderman, N. B. (Harvard Med. Sch.,
oston, Mass.), C. J. Toews, C. Lowy, I. Vreeland
nd E. Shafrir. *Amer J Physiol* 219(1):51-57, 1970.

he effects of pent-4-enoic acid on gluconeogenesis,
atty acid oxidation and the redox state of the per-
used rat liver were studied by enzyme and metabolite
ssays. Pent-4-enoic acid (0.5-1.0 mM) inhibited
luconeogenesis from alanine and ketone body produc-
ion from linoleate by 80% in isolated perfused rat
iver. It also inhibited gluconeogenesis from
spartate (75%) but did not diminish either glycerol
fructose conversion to glucose. Octanoate in
ace of linoleate had little effect on gluconeogenesis
om alanine or ketone body production. Following
nt-4-enoic acid (1mM) tissue levels of 3-phospho-
ycerate, phophoenolpyruvate, and pyruvate increased
control 336, 70, 27; treatment 874, 232, 943 nmoles/
t wt, resp.). The lactate:pyruvate ratio in tissue
d β-hydroxbutyrate:acetoacetate ratio in the
rfusate also decreased, suggesting that intra-
llular NADH levels were diminished. Pyruvate
rboxylase and phosphoenolpyruvate carboxykinase
tivities when assayed directly were unchanged,
dicating that pent-4-enoic acid did not irreversibly
activate these enzymes. Pent-4-enoic acid probably
ppresses gluconeogensis by inhibiting long-chain
tty acid oxidation.

426 BIOSYNTHESIS OF 3-HYDROXY-3-METHYLGLUTARATE
AND MEVALONATE BY RAT LIVER HOMOGENATES *IN
TRO. (E.)* White, L. W. (Case Western Reserve U.,
ept. Pharmacol., Cleveland, Ohio) and H. Rudney.
ochemistry 9(13):2713-2724, 1970.

egulation of 3-hydroxy-3-methylglutaryl-coenzyme A
IMG-CoA) and mevalonate biosynthesis was studied
fractionated rat liver homogenates and three sys-
ems were developed for assay of HMG-CoA condensing
zyme. In the first system, the soluble fraction
as fully competent with respect to HMG formation;
th CoA and ATP were required for optimal activity.
1-^{14}C-acetate concentration of 7 x 10^{-4}M gave
aximum incorporation of HMG. The rate of incor-
ration was directly proportional to the amount
soluble supernatant added. Effects of Mg^{++} and
TA on acetoacetate formation were opposite to
ose on incorporation of HMG. In the second system
icrosomal system), when ^{14}C-acetyl-CoA was the
bstrate, incorporation into HMG occurred readily
ith whole microsomes or an EDTA microsomal extract;
P was not required. A TPNH generating system or
ddition of Mg^{++} or the omission of EDTA resulted
decreased activity. In the third system (soluble
ystem), incorporation of ^{14}C-acetyl-CoA into HMG
as decreased by the addition of Mg^{++} or omission
EDTA but, addition of a TPNH generating system
d no effect. Three systems were also developed
r the assay of HMG-CoA reductase. These included
the incorporation of labeled acetate into HMG and mevalonic acid requiring both soluble fraction and microsomes, incorporation of labeled acetyl-CoA into mevalonic acid also requiring microsomes. A method for determining the rate of synthesis of HMG and mevalonate, as contrasted with ^{14}C incorporation from labeled precursors, was described. Very little of the HMG formed was bound to protein and data supporting the role of HMG-CoA as an intermediate in mevalonate synthesis were presented.

6427 METABOLIC CHARACTERIZATION OF ACTIVELY PHAGOCYTIZING ISOLATED RAT KUPFFER CELLS. *(E.)* Pisano, J. C. (Tulane U. Sch. Med., New Orleans, La.) and N. R. DiLuzio. *J Reticuloendothel Soc* 8(1):25-36, 1970.

The phagocytic and metabolic activity of the Kupffer cell in rat liver was evaluated. The Kupffer cells, isolated by enzymatic digestion of rat liver, were actively phagocytic, responding to pH changes (optimum pH for phagocytosis of either gelatinized reticuloendothelial test lipid emulsion or colloidal gold lies between 6.5 and 7.0), incubation time (the amount of colloidal gold uptake progressively increased) and alterations of the particle-to-cell ratio (any increase in the particle concentration or the number of cells resulted in an increased Kupffer cell uptake). While the cells oxidized glucose and acetate, no significant increases in the amount of these substrates oxidized occurred during phagocytosis. The Kupffer cells utilized, to some degree, the hexosemonophophate shunt for glucose metabolism but the degree of participation of this pathway to total glucose metabolism was not altered during phagocytosis. During phagocytosis there was a decrease (control 0.39 ± 0.06; treatment 0.22 ± 0.02 μg substrate/10^{6} cells) in the oxidation of exogenous acetate. These findings suggest a unique phagocytic metabolism for Kupffer cells and emphasize the metabolic differences among the various macrophage populations of the reticuloendothelial system.

6428 HORMONE ACTION AT THE MEMBRANE LEVEL: I. PROPERTIES OF ADENYL CYCLASE IN ISOLATED PLASMA MEMBRANES OF RAT LIVER. *(E.)* Ray, T. K. (U. Rochester Sch. Med. Dent., N. Y.), V. Tomasi and G. V. Marinetti. *Biochim Biophys Acta* 211(1):20-30, 1970.

The properties of membrane bound adenyl cyclase in rat liver and its interactions with hormones and metal ions were studied. Optimum membrane protein concentration was found to be 60-70 μg and with 1 mM Mg^{+2} and 85 μg membrane protein, 0.3 mM ATP was needed to attain maximum velocity. The effect of Mg^{+2} on adenyl cyclase was also studied and its optimum concentration was found to be 4 to 5 mM in the presence of added 2.5 mM ATP. Ca^{+2} stimulated the basal activity of the enzyme at 0.03 to 0.3 mM, Na^{+} inhibited the enzyme, and K^{+} at 50 mM gave moderate stimulation. The effects of various detergents causing membrane solubilization showed enzyme stimulation by Triton X-100 and sodium dodecyl sulfate whereas deoxycholate caused slight inhibition. Ca^{+2} enhanced the epinephrine stimulation of adenyl cyclase and epinephrine enhanced Ca^{+2} binding to the membrane. The glucagon stimulation was enhanced by Ca^{+2} at 10^{-3} mM but inhibited by Ca^{+2} at 5×10^{-4} mM. Insulin inhibited adenyl cyclase activity as well as the glucagon stimulation of the enzyme.

6429 NEW CHOLERETICS: ELIMINATION AND EFFECT ON BILIRUBIN EXCRETION IN RATS. *(Ger.)*

Beck, K. (Med. U. Clin. Freiburg, Germany) and J. Bierwisch. *Arzneimittelforschung* 20(5):693-699, 1970.

Choleresis by 1-phenyl-1-hydroxy-n-pentane (PC 1) 1-(5,6-dihydropyranyl-3)-2-phenyl-ethanol-(1)(C-29) and O-(2-hydroxy-3-hexyl-oxy-propoxy)-sodium benzoate(DCh21) was compared with sodium dehydrocholate induced bile secretion in rats. Intraduodenal administration of equimolar amounts of the choleretics (0.5 mmoles/kg body weight) showed C29 to have the highest bile secretory effect (186%) without affecting bilirubin excretion. Highest bilirubin excretion occurred following i.v. and intraduodenal sodium dehydrocholate. The choleretics were excreted into the bile as glucuronides, hence becoming choleretically ineffective, while sodium dehydrocholate still maintained choleretic activity after enterohepatic circulation. Choleretic activity of the conjugated compounds was recovered only by β-glucuronidase action.

6430 REDUCTION OF THE Δ^4-3-KETOSTEROIDS BY NORMAL AND HYPERTENSIVE RAT LIVER. *(E.)*

Silah, J. G. (Dept. Path. Chem., U. Toronto, Ontario, Canada). *Endocrinology* 87(1):90-98, 1970.

The effect of high blood pressure on the rate of hepatic inactivation (Δ^4-hydrogenation) of Δ^4-3-ketosteroids by the soluble microsomal fraction was investigated *in vitro* with liver homogenates from experimentally prepared renal hypertensive male rats. The *in vitro* capacity for the reduction of ring A by livers from operated hypertensive rats (mean pressure 174 mm) was remarkably greater than that by livers from normal rats for cortisol (2.1-fold) and corticosterone (2.4-fold) and livers of operated rats that did not become hypertensive behaved similarly to normals. Differences in the Δ^4-hydrogenase activity seen in hypertensive rats may be explained as differences in enzyme content and/or activity of the liver, because all incubations were carried out in the presence of excess TPNH. Hence high blood pressure or its causative factors probably affects the enzymatic activity of the liver and possibly other tissues including the adrenal.

6431 METHIONINE TOXICITY AND ORNITHINE δ-AMINOTRANSFERASE IN CHANG'S LIVER CELLS. *(E.)*

Strecker, H. J. (Albert Einstein Coll. Med., Yeshiva U., New York), U. B. Hammar and P. Volpe. *J Biol Chem* 245(13):3328-3334, 1970.

Chang's liver cells grown in Eagle's minimum essential medium and containing 10% horse serum were used to study methionine toxicity and ornithine δ-aminotransferase. The addition of excess L-methionine to the culture media resulted in inhibition of cell multiplication, accumulation of cellular protein, and, relative to the latter, an excessive increase of ornithine δ-aminotransferase activity. Activity of ornithine δ-aminotransferase per cell increased about 250% and specific activity about 65% during 3 days of growth under these conditions. Glycine, serine, histidine, tyrosine, and tryptophan also inhibited cell multiplication and brought about an accumulation of cellular protein, but did not increase ornithine δ-aminotransferase activity relative to other protein. Incorporation of ^{14}C-leucine into cellular protein was also inhibited by excess methionine and the degree of inhibition roughly paralleled the inhibition of cell multiplication. Addition of homocysteine to the culture medium produced the same effects as methionine at about one-tenth the concentration. The toxic manifestations of excess dietary methionine, which in thi case were growth retardation and protein accumulation, were not antagonized by glycine or arginine as they are *in vivo*. Excess arginine in the medium did not inhibit cell multiplication appreciably nor cause accumulation of cellular protein, but it did elevate ornithine δ-aminotransferase activity, suggesting the increase of ornithine δ-aminotransferase activity was probably unrelated to inhibition of cell division and accumulation of cellular protein.

6432 COMPARATIVE EFFECT OF EXPERIMENTAL INJURY AND HYDROCORTISONE INJECTION ON LIVER AND PLASMA COMPOSITION OF RATS. *(E.)*

Gilder, H. (Cornell U. Med. Coll., New York, N.Y.), M. Valcic, V. DeLeon and D. Sternberg. *Metabolism* 19(8):562-568, 1970.

The catabolic response to injury was compared with that after i.m. injections of hydrocortisone in 100 male rats on a diet constant in nitrogen and calories but varying in fat and carbohydrate. Injur by femur multiple fracture or 5 mg of hydrocortisone day resulted in a reduction of weight gain and after 2 days the anabolic activity after both treatments wa evident in the enlargement of the liver and an increase of liver nitrogen and ribonucleic acid. There was relatively much greater elevation of RNA nitroge than of total nitrogen in the livers of the injured rats than in the hydrocortisone treated rats. Total liver glycogen and plasma non-esterified fatty acids were reduced in the injured rats but were elevated to extremely high levels in the hydrocortisone rats. Total liver fat was elevated by both treatments in rats on the normal and high carbohydrate diets but not in those on the high fat diet.

6433 *N*-HYDROXY-2-ACETYLAMINOFLUORENE SULFOTRA FERASE: ITS PROBABLE ROLE IN CARCINOGENES AND IN PROTEIN-(METHION-*S*-YL) BINDING IN RAT LIVER. *(E.)*

DeBaun, J. R. (U. Wisconsin Med. Ctr., Madiso E. C. Miller and J. A. Miller. *Cancer Res* 30(3):577-595, 1970.

1- and 3-Methylmercapto-2-acetylaminofluorene were identified as degradation products of hepatic prote bound methionyl derivatives after the administratio of 2-acetylaminofluorene (AAF) or *N*-hydroxy-AAF to rats. The amounts of *o*-methylmercapto-AAF obtained from liver protein were proportional to the i.p. do of *N*-hydroxy-AAF and appeared to be a measure of th

ount of ester-like metabolites of the carcinogen
rmed *in vivo*. 1- and 3-Methylmercapto-2-amino-
uorene were not obtained as degradation products of
e liver proteins of rats, mice, hamsters or guinea
gs given *N*-hydroxy-AAF or of rats given *N*-hydroxy-
aminofluorene. The soluble proteins of rat liver
ntained sulfotransferase(s) which synthesize AAF-*N*-
lfate from *N*-hydroxy-AAF and 3'-phosphoadenosine
-phosphosulfate; magnesium and manganous ions
imulated the system. Under a variety of conditions,
e *N*-hydroxy-AAF sulfotransferase activity in rat
ver, as assayed *in vitro*, paralleled the amounts
o-methylmercapto-AAF which could be released from
e livers of similarly treated rats after administra-
on of *N*-hydroxy-AAF and the susceptibility to liver
mor induction by *N*-hydroxy-AAF. Adult male rat
ver contained considerably more *N*-hydroxy-AAF sul-
transferase activity and formed considerably more
otein-bound 1- and 3-(methion-*S*-yl)-AAF *in vivo*
an did the livers of female rats or of male mice,
msters, rabbits or guinea pigs. Female rats and
e latter species were relatively resistant to
patic carcinogenesis with *N*-hydroxy-AAF. The
creased hepatocarcinogenicity of 2-aminofluorene
rivatives in female gonadectomized rats given
stosterone and the marked inhibition of hepato-
rcinogenesis with *N*-hydroxy-AAF in hypophysecto-
zed or thyroidectomized male rats were mirrored by
rresponding changes in hepatic sulfotransferase
tivity for *N*-hydroxy-AAF and the formation of
otein-bound methionyl-AAF derivatives *in vivo*. AAF-
sulfate appeared to be one of the ultimate reactive
d carcinogenic metabolites of AAF and *N*-hydroxy-AAF
rat liver.

34 REGULATION OF LIPOGENESIS: STIMULATION OF FATTY ACID SYNTHESIS *IN VIVO* AND *IN VITRO* THE LIVER OF THE NEWLY HATCHED CHICK.

(E.) Good-
dge, A. G. (Banting Best Dept. Med. Res., U. Toronto,
nada). *Biochem J* 118(2):259-263, 1970.

patic lipogenesis was stimulated *in vivo* and *in*
tro in liver and in liver slices from newly hatched
icks by forced feeding (stomach intubation) of
ml of a 20% glucose solution as the sole diet.
ver slices were incubated in a buffered Krebs-
nger solution and total fatty acids, CO_2, protein
nthesis and glycogen accumulation were measured
standard techniques. The single glucose meal
imulated the incorporation of acetate into fatty
ids in liver slices, but addition of glucose *in*
tro had no effect. Labeled acetate incorporation
g atoms incorporated/hr/100 mg wt) into fatty
ids was 0.7 in unfed control chicks, 145 in glu-
se-fed chicks; and when chicks were force-fed
lutions of fructose or glycerol, the acetate-fatty
id incorporation values were 7.9 and 5.0, resp.
vitro addition of fructose and glycerol markedly
imulated fatty acid synthesis from acetate. Fatty
id incorporation (ng atoms incorporated/hr/100 mg
) from labeled acetate in liver slices from un-
d chicks was 1.8 in the untreated controls, 48 in
ices treated with 11 mM fructose and 29 in slices
eated with 20 mM glycerol. Stimulation of fatty
id synthesis caused by fructose did not require
e synthesis of enzyme, indicating the presence of
tent fatty-acid synthesizing enzymes in livers of
e unfed chicks.

6435 INDUCTION OF LIVER TYROSINE AMINOTRANSFERASE BY THEOPHYLLINE AND ITS REPRESSION BY PHENTOLAMINE AND GLUCOSE IN ADRENALECTOMIZED RATS.

(E.) Kato, K. (Sch. Med. U. Nagoya, Japan). *FEBS Letters* 9(2):105-107, 1970.

Evidence is presented in this study for existence of a specific adrenotropic receptor controlling rat liver tyrosine aminotransferase. Theophylline (10 mg), 1-epinephrine (100 μg), phentolamine (2 mg), propranolol (0.7 mg) or cycloheximide (1 mg) were injected intraperitoneally into fasted rats (about 150 g). After sacrifice, the livers were removed, homogenized and tyrosine aminotransferase assayed. Theophylline increased enzyme activity several-fold while cycloheximide inhibited the increase, suggesting that the elevation was caused by *de novo* formation. The induction caused by theophylline was inhibited by phentolamine, an inhibitor of tyrosine aminotransferase induction by aromatic carboxylic acids. This induction was also repressed by glucose and epinephrine although simultaneous epinephrine and propranolol injection caused a marked increase of enzyme activity. The induction of tyrosine aminotransferase may result from an elevation of cyclic AMP.

6436 BINDING AND KINETIC STUDIES OF LIVER ALCOHOL DEHYDROGENASE-COENZYME-PYRAZOLE.

(E.) Shore, J. D. (Henry Ford Hosp., Detroit, Michigan) and M. J. Gilleland. *J Biol Chem* 245(13):3422-3425, 1970.

Liver alcohol dehydrogenase (from horse liver) complexes with pyrazole and the coenzyme nicotinamide adenine dinucleotide (NAD$^+$) or analogues nicotinamide hypoxanthine dinucleotide (NHD$^+$) or acetyl pyridine adenine dinucleotide (AcPyAD$^+$) were studied by spectral, kinetic, and equilibrium binding techniques. The dissociation constant for NHD$^+$ (709 μM) from alcohol dehydrogenase was higher than that for NAD$^+$ (110 μM) due to decreased rates of association indicating that the modified adenine ring has not affected substrate binding. Spectra for ternary complexes peaked at 290 nm with NAD$^+$ and NHD$^+$ and at 308 nm with AcPyAD$^+$ suggesting involvement of the pyridine ring in the formation of the complex. Dissociation constants of coenzyme from the ternary complexes were higher for NHD$^+$ (5.7 μM) and for AcPyAD$^+$ (2.7 μM) than for the NAD$^+$ (0.65 μM) coenzyme, while dissociation constants of pyrazole from the ternary complex were similar for NAD$^+$ (0.142 μM) and NHD$^+$ (0.091 μM) but was much higher for AcPyAD$^+$ (1.17 μM).

6437 INTERACTIONS BETWEEN MALONDIALDEHYDE AND RAT LIVER MITOCHONDRIA.

(E.) Horton, A. A. (Dept. Biochem., U. Birmingham, England) and L. Packer. *J Geront* 25(3):199-204, 1970.

Malondialdehyde metabolism and increased resistance of mitochondria to Triton disruption were investigated in rat liver. At low concentrations (4 to 6%) malondialdehyde did not result in trapping mitochondrial protein configurational states but did have a stabilizing effect on the mitochondrial membrane. This process may be related to organelle aging processes since aldehyde metabolizing systems may be a protective mechanism decreasing the accumulation of potentially destructive aldehydes.

6438 EFFECT OF MAGNESIUM DEFICIENCY IN GROWING RATS ON SYNTHESIS OF LIVER PROTEINS AND SERUM ALBUMIN. *(E.)* Scwartz, R. (Dept. Nutr., U. Connecticut, Storrs), N. A. Woodcock, J. D. Blakely, F. L. Wang and E. A. Khairallah. *J Nutr* 100(1):123-218, 1970.

The effect of dietary magnesium deficiency on protein synthesis in male weanling rat liver was investigated. *In vivo* incorporation of L-^{14}C-valine into serum albumin was significantly ($p < 0.01$) reduced in livers of rats fed a 36% casein diet with .008, .04, .08% magnesium. Rate of disappearance of labeled albumin from the livers of deficient rats, however, was lower ($t_{1/2}$ of 18.4 hr) than that in pair fed controls fed adequate magnesium ($t_{1/2}$ of 11.4 hr). *In vitro* rate of incorporation of L-^{14}C-valine by free and membrane-bound polysomes into total protein and serum albumin was consistently depressed in preparations from magnesium-deficient rats. No structural or functional changes were found in the polysomes. Most of the albumin synthesized *in vitro* was formed by membrane-bound polysomes and constituted 75% of the protein synthesized on this fraction. The change in protein synthetic capacity appeared to reside entirely in the supernatant fraction and the magnesium concentration of the supernatant fraction was significantly reduced ($p < 0.01$), but this reduction probably was not the major cause of the change in rate of protein synthesis.

6439 FACTORS THAT MODIFY THE METABOLISM OF ETHANOL IN RAT LIVER AND ADAPTIVE CHANGES PRODUCED BY ITS CHRONIC ADMINISTRATION. *(E.)* Videla, L. (Dept. Pharmacol., U. Toronto, Ontario, Canada), and Y. Israel. *Biochem J* 118(2):275-281, 1970.

The factors affecting metabolism of ethanol including chronic administration were investigated in rat liver slices. In the presence of 18% O_2, the rate of ethanol disappearance was 16.1 µmole/hr/g tissue and 37.5 µmole/hr/g with 95% O_2. Cyanide strongly inhibited the metabolism of ethanol (10 µmole/hr/g), but its effect was more marked at lower partial pressure of O_2. In the presence of 18% O_2, 0.1 mM 2,4-dinitrophenol produced a 160% increase in the rate of ethanol metabolism, but there was no significant dinitrophenol effect on ethanol with 95% O_2. In another experiment, arsenate at a concentration of 10mM increased ethanol metabolism by 80%, although at 37 and 50 mM, it inhibited the rate of ethanol metabolism. Chronic administration of ethanol for 3 to 4 weeks, in doses of 3 to 8 g/kg per day, increased by 70 to 90% the ability of the liver to metabolize ethanol (controls, 16.1 vs 29.9 µmole/hr/g). Dinitrophenol added to the medium did not further increase the metabolism of ethanol. If chronic administration of ethanol was discontinued for 2 weeks, the rate of ethanol metabolism was lowered to control values and the activating effect of dinitrophenol was recovered. No change in alcohol dehydrogenase activity was found in rat livers in which the metabolism of ethanol had been increased as a result of chronic ethanol treatment, although a 40% increase in the activity of succinate dehydrogenase was observed.

6440 HEPATIC PROTEIN METABOLISM IN THE INFANT RA *(E.)* Czajka, D. M. (Coll. Human Med., Michigan St. U., East Lansing), S. A. Miller and A. B. Browning. *J Nutr* 100(3):309-314, 1970.

Anabolic activity in the infant rat was measured by incorporation of ^{14}C-leucine (0.05 µC) into the liver and into isolated microsomes. The lowest rate of leucine incorporation into the microsomal proteins occurred in 1- and 2-day old rats while the peak of incorporation occurred in 6-day-old rats. The turnover of microsomal protein appeared to increase with age since the 1-day-old rats lost 10% of the microsomal protein radioactivity while the 11-day-old rats lost 60% radioactivity. However, the low turnover of protein seen in younger animals may be due rather to a high rate of reutilization of leucine. Cathepepsin activity which was monitored as a measure of catabolic activity was highest during the neonatal period, indicating a probable high rate of leucine reutilization.

6441 INFLUENCE OF PYRIDOXINE ON TYROSINE TRANSAMINASE ACTIVITY IN MATERNAL AND FETAL RAT LIVER. *(E.)* Susten, S. S. (Food Nutr. Dept., Purdue U., Lafayette, Ind.) and A. Kirksey. *J Nutr* 100(3):369-374, 1970.

The effect of pharmacological doses of pyridoxine (100 mg/100 g wt) on holotyrosine transaminase (HTA) and total tyrosine transaminase activity (TTA) in maternal and fetal rat liver was studied. Intact and adrenalectomized groups received saline injections, cortisol (0.125 mg/100 g wt) or pyridoxine and the animals were sacrificed after 5 hr and tyrosine transaminase activity and total protein concentrations measured. HTA was only slightly higher in control pregnant rats compared to nonpregnant animals while adrenalectomy did not appear to affect holoenzyme activity. TTA levels in pregnant rats were higher than in nonpregnant animals (383, 539 and 613 µmoles/g/hr in intact, nonpregnan animals compared to 572, 839 and 792 for intact pre nant rats for saline, cortisol and pyridoxine treat resp.). Pyridoxine administration tended to raise HTA and TTA except in the adrenalectomized animals. The observation that TTA and HTA were raised in fetuses of rats treated with pyridoxine suggests that the stimulatory mechanism of the enzyme by pyridoxi is active in fetal liver.

6442 LIPID BIOSYNTHESIS IN RAT LIVER SLICES: EFFECTS OF IONS, ATP AND SUBSTRATE CONCENTRATION ON GLYCEROL INCORPORATION. *(E.)* Libert J. P. (Med. Coll. Virginia, Richmond), and P. F. Jezyk. *Biochem Biophys Acta* 210(2):221-229, 1970.

effects of ion (Na^+,K^+,HCO_3^-,HPO_4^{-2},Ca^{++}) com-
ition and ATP and related compounds as well as
strate concentration on glycerol metabolism by
liver slices were studied via ^{14}C-glycerol incor-
ation and chromatographic analysis of lipid extracts.
the ions tested, HCO_3^- (0.5 normal Krebs-Ringer
O_3^-]) decreased label incorporation into lipid
e than 50% but had little effect on label incor-
ation into glycogen; these effects were markedly
centration dependent. Ca^{+2}(3mM) stimulated
lative incorporation 135%) glycerol incorporation
o total lipid in all cases. ATP and related
leotides decreased (relative incorporation 100,
to 62, 53%, resp.) this incorporation in Krebs-
ger solution buffered with Tris or phosphate but
reased it in the presence of HCO_3^- (relative
orporation 8% to 19%). Inclusion of either HCO_3-
ATP in the incubation medium resulted in an
reased percentage of label in the acidic lipid
ction. At saturating substrate concentrations,
e label appeared in lecithin and less in neutral
ids than at low concentrations. Changes in ionic
position or substrate concentration within physio-
ical limits apparently can alter metabolic patterns
erved in isolated tissues, suggesting that such
ameters may be important in the regulation of
id metabolism *in vivo*.

3 COMPARATIVE SENSITIVITY OF THE NUCLEAR AND
MITOCHONDRIAL DNA SYNTHESES TO X-IRRADIA-
N AND TO THE ADMINISTRATION OF A SULFHYDRL RADIO-
TECTOR (AET) IN NORMAL AND REGENERATING RAT LIVER.
) Baugnet-Mahieu, L. (Ctr. Study Nucl. Energy,
, Belgium), R. Goutier and C. Baes. *Biophysik*
):357-366, 1970.

influence of radiation and of a sulfhydryl radio-
tector, aminoethylisothiouronium bromide hydrobro-
e (AET), on synthesis of nuclear (N-) and mito-
drial (M-) DNA in rat liver was studied. Partial
atectomy was performed on rats which later received
ingle X-ray dose (500 or 1,500 R). Rats treated
n AET were injected (150 mg/kg, i.p.) 15 minutes
ore irradiation. Nuclear and mitochondrical DNA
thesis was monitored via ^{14}C-thymidine incorporation
o DNA of livers of normal animals and those killed
to 24 hr after partial hepatectomy. Inhibition of
midine uptake into N-DNA developed rapidly and was
ater than for M-DNA but maximum inhibition was
ched 4 hours post-irradiation for both DNAs. Dose
endency was evidenced with inhibition of M-DNA, the
ibition being greater after 1,500 R than after a
R dose. Time of recovery was also found to be
e-dependent for N-DNA synthesis but the rate of re-
ery was not. AET, which exerts only small inhibi-
y effects on DNA synthesis in normal liver, was
n to inhibit synthesis of both DNA's in regenerating
er. No radioprotection was noted against a 1,500
ose. Irradiation appears to interfere with enzyma-
processes of M- and N-DNA synthesis, but the per-
tence of N-DNA inhibition may be due to a temporary
ck in the cellular cycle.

4 OXIDATIVE PHOSPHORYLATION: THE SPECIFIC BINDING
OF TRIMETHYLTIN AND TRIETHYLTIN TO RAT LIVER
OCHONDRIA. *(E.)* Aldridge, W. N. (Med. Res. Council, Carshalton, England) and B. W. Street. *Biochem J* 118(1):171-179, 1970.

Mitochondria from rat liver homogenates were used to study the binding of trimethyltin and triethyltin to the mitochondria. Scatchard plot analysis showed one binding site having the correct characteristics for the site to which trimethyltin and triethyltin are attached when they inhibit oxidative phosphorylation. For each compound the concentration of the site was 0.8 nmole/mg of protein and the ratios of their affinity constants were the same as the ratio of the concentrations inhibiting oxidative phosphorylation. The binding site was present in a Triton X-100 fraction derived from mitochondria containing only 15% of the original protein. In this preparation ultrasonication rapidly destroyed the site. Dimethyltin and diethyltin did not prevent binding of triethyltin to rat liver mitochondria, whereas triethyl-lead did. Trimethyltin and triethyltin were bound to mitochondria from brown adipose tissue and the results indicated a binding site similar to that in rat liver mitochondria.

6445 STUDIES ON THE METABOLISM OF C_{19} STEROIDS IN RAT LIVER: VII. 18-HYDROXYLATION OF 17-OXO-C_{19} STEROIDS IN RAT LIVER MICROSOMES. *(E.)* Gustafsson, J. A. (Karolinsia Inst., Stockholm, Sweden) and B. P. Lisboa. *Steroids* 15(6):723-735, 1970.

An 18-hydroxylase active on 17β-hydroxy-C^{19} steroids in rat liver microsomes was found to be active on 17-oxo-C_{19} steroids also. Incubation of rat liver microsomes with 4-androstene-3,17-dione, 5α-androstane-3, 17-dione, 3α-hydroxy-5α-androstan-17-one, 3β-hydroxy-5α-androstan-17-one, 17β-hydroxy-4-androsten-3-one, and 17β-hydroxy-5α-androstan-3-one, resulted in the production of 18-hydroxy-4-androstene-3,17-dione, 18-hydroxy-5α-androstane-3,17-dione, 3α,18-dihydroxy-5α-androstan-17-one and 3β,18-dihydroxy-5α-androstan-17-one which were isolated and characterized by thin layer and gas chromatography and mass spectroscopy. The liver may have an important role in extra-adrenal 18-hydroxylation of steroids.

6446 PROTEIN SYNTHESIS IN LIVER AND BRAIN MICROSOMES ISOLATED FROM RATS FED A HIGH PHENYLALANINE DIET. *(E.)* Rudolph, N. (Maimonides Med. Ctr., Brooklyn, N. Y.) and J. J. Betheil. *J Nutr* 100(1): 21-29, 1970.

Rats (21 days old) were fed a diet high in phenylalanine and liver and brain microsomes were studied for their capacity to incorporate amino acid. After appropriate treatment, determination of leucine and phenylalanine pool sizes in microsomes was made by isotope dilution technique. Liver microsomes from rats fed a high phenylalanine diet revealed a 55 and 60% increase in incorporation of labeled leucine and phenylalanine compared with controls. Brain microsomal pools of leucine and phenylalanine showed no differences in size between experimental and control animals. RNA content of liver microsomes and amino acid incorporation by brain microsomes was similar in all groups.

6447 HORMONE ACTION AT THE MEMBRANE LEVEL: II. THE BINDING OF EPINEPHRINE AND GLUCAGON TO THE RAT LIVER PLASMA MEMBRANE.

(E.) Tomasi, V. (U. Rochester Sch. Med. Dent., New York), S. Koretz, T. K. Ray, J. Dunnick and G. V. Marinetti. *Biochim Biophys Acta* 211(1):31-42, 1970.

The binding of glucagon and epinephrine to the different membranes of the rat liver cell was studied and an attempt was made to correlate the hormone binding with adenyl cyclase activity. Both hormones have a 5- to 20-fold higher affinity for the plasma membrane than for nuclear, mitochondrial, or microsomal membranes. The binding of glucagon to the plasma membrane was more rapid than the binding of epinephrine, which was inhibited (control 70 pmoles epinephrine/mg protein/hr, treatment 51) by 100 μg propanolol. A study of several epinephrine analogs (phenylalanine, norepinephrine, DOPA) showed that the 2 ring hydroxyl groups are important in the binding of epinephrine to the membrane. *p*-Chloromercuribenzoate and 5',5'-dithiobis-2-nitrobenzoic acid both inhibited epinephrine binding (control 30; treatment 0.5 and 2, resp.) and glucagon binding, thus implicating SH groups on the receptor proteins. Heating membranes for 1 min at 100° did not affect hormone binding but nearly inactivated the adenyl cyclase. Heating for 5 min at 100° abolished the hormone binding (control 30; treatment 2); hence hormone receptor proteins are probably separate from the adenyl cyclase. Extraction of membrane-bound epinephrine with chloroform-methanol removed 20-25% of the bound hormone, indicating at least 2 types of membrane-bound epinephrine. The receptor proteins were eluted just ahead of the void volume (following isolation by column chromatography on Sephadex G-200) and were separated from the major adenyl cyclase activity.

6448 QUANTITATIVE AND METABOLIC CHANGES OF HEPATIC COLLAGENS IN RATS AFTER CARBON TETRACHLORIDE POISONING.

(E.) Hirayama, C. (Fac. Med., Kyushu U., Fukuoka, Jap.), I. Morotomi and K. Hiroshige. *Biochem J* 118(2):229-232, 1970.

Quantitative and metabolic changes of hepatic collagens were studied in rats following carbon tetrachloride poisoning. Hepatic collagen was composed of 3.5% neutral-soluble collagen, 4.9% acid-soluble collagen and 91.6% insoluble collagen. During subacute poisoning with carbon tetrachloride, hepatic contents of insoluble collagens expressed as μg/g liver) was markedly increased (control 132 vs 458 and 550 for 4 and 8 weeks, resp.), whereas those of soluble collagens did not change. In labeling studies with $[^{14}C]$-proline *in vitro*, specific radioactivities of neutral soluble, acid soluble and insoluble collagens of the liver were 233,000, 69,000 and 830 dpm/μmole of hydroxyproline, resp., after 1 hr. After 8 weeks of carbon tetrachloride poisoning, specific radioactivities (dpm/μmole of hydroxyproline) increased (neutral-soluble, control, 233 vs 772; acid-soluble, control 69 vs 461) while that of insoluble collagen decreased (control 0.83 ± 0.16 vs 0.50 ± 0.04). During recovery from poisoning, increased specific radioactivities of soluble collagen decreased towards the normal range and insoluble collagen further decreased. Hepatic collagenolytic activity solubilizing insoluble collagen, which differs from mammalian collagenase, decreased under conditions of subacute poisoning and also during recovery from subacute poisoning.

6449 EFFECT OF CARBON TETRACHLORIDE AND OTHER INHIBITORS OF DRUG METABOLISM ON THE METABOLISM AND ACTION OF ESTRADIOL-17β AND ESTRONE IN THE RAT.

(E.) Levin, W. (Hoffmann-La Roche, Nutley N. J.), R. M. Welch and A. H. Conney. *J Pharmacol Exp Ther* 173(2):247-255, 1970.

The effect on the metabolism of estradiol-17β-6,7-H^3 or estrone-6,7-H^3 of CCl_4 treatment on immature fema rats was studied *in vivo* and *in vitro*. The administ tion of 0.67 ml of CCl_4 inhibited by 75 to 80% the ability of the liver microsomes to metabolize estradiol-17β and estrone to more polar metabolites. The inhibitory effect of CCl_4 administration on estrogen metabolism *in vitro* was reflected *in vivo* by an alte ed total body metabolism of estradiol-17β and estron by potentiation of the uterotropic action of these estrogens and by an increased concentration of these estrogens in the uterus. Pretreatment of rats with tetrachloroethylene did not influence the action of estrone. SKF 525A or desmethylimipramine potentiate the uterotropic action of estrone and increased the concentration of estrogen in the uterus.

6450 SYNTHESIS AND SECRETION OF α_2-(ACUTE PHAS GLOBULIN BY THE ISOLATED PERFUSED LIVER FROM INJURED ADULT RATS.

(E.) Sarcione, E. J. (Roswell Park Mem. Inst., Buffalo, N. Y.). *Biochemistr* 9(15):3059-3062, 1970.

The synthesis and secretion of α_2-(acute phase) globulin was studied by the following DL-^{3}H-leucine (100 μC) incorporation in isolated perfused liver from normal and injured (1 ml s.c. commercial grade steam-distilled wood turpentine) rats. Perfusion o livers from the injured animals with blood from injured animals produced a rapid increase (after an initial 45 min delay) in ^{3}H-leucine incorporation into α_2-(acute phase) globulin (specific activity of 175 dpm/mg protein at 45 min to 1575 dpm/mg protein at 180 min) while livers and blood from normal animals produced only slight increases in incorporation (88 dpm/mg protein at 45 min to 175 dpm/mg protein at 180 min) and normal livers perfused wit blood from injured animals produced no measurable incorporation (formed elements in the blood are no the source of the globulin). Incorporation of the radioactivity into plasma albumin during the same perfusions was rapid with the specific activity of albumin from plasma perfusing the livers of injure rats consistently higher than that from plasma perfusing the livers of normal animals (specific acti ranges over 45 to 180 min were 1000 to 49000 dpm/m protein and 500 to 4100 dpm/mg protein, resp.). I munoelectrophoresis of the plasma perfusates using monospecific rabbit antiserum reagent to the rat α_2-(acute phase) globulin produced only 1 precipit arc in the slow α_2 region and radioautography of t immunoelectrophoretic patterns revealed labeling o of the perfusate from injured rats indicating that the incorporation is not a nonspecific binding of

-leucine to the precipitin arc. The appearance of
-(acute phase) globulin after injury is apparently
e to *de novo* synthesis and secretion rather than to
e release of stored globulin.

1 INHIBITION BY α-AMANITIN OF INDUCTION OF
TYROSINE TRANSAMINASE IN RAT LIVER BY
TISOL. *(E.)* Sekeris, C. E. (Physiol. Chem. Inst.,
burg, Germany), J. Niessing and K. H. Seifart.
S Letters 9(2):103-104, 1970.

of α-amanitin, an inhibitor of mammalian RNA
ymerase, was made to study whether the induction
tyrosine transaminase by cortisol is dependent on
synthesis or is independent of transcription.
r groups of male rats were used in the study: one
eiving amanitin (120 μg) and cortisol (2 mg), a
ond receiving amanitin alone, a third cortisol
y and the fourth group served as control. Tyro-
e transaminase was assayed by a radiochemical
hod. Cortisol administration led to a rapid
mulation of tyrosine transaminase, whereas pre-
atment with amanitin suppressed hormonal induction
the enzyme. Amanitin alone caused a decline of
enzyme level which was reversible by cortisol.
nitin suppressed RNA synthesis up to 85% within 3
4 hr after administration and abolished hormonal
uction of the liver enzyme. Induction of tyro-
e transaminase appears to be dependent on *de*
o synthesis of RNA.

2 DISTRIBUTION OF RADIOACTIVE HEMOPROTEIN
AND CO-BINDING PIGMENT IN ROUGH AND SMOOTH
OPLASMIC RETICULUM OF RAT LIVER. *(E.)* Levin, W.
llcome Res. Lab., Tuckahoe, N. Y.), A. P. Alvares
R. Kuntzman. *Arch Biochem Biophys* 139(1):230-235,
).

incorporation of radioactivity into the hemo-
teins of the rough and smooth endoplasmic reti-
m (isolated by the method of Dallner) after the
nistration of ^{3}H-δ-aminolevulinic acid (0.24 mg/
.v.) or L-leucine-4,5-^{3}H (0.01 mg/kg i.v.) was
lied in the microsomal fraction of rat liver.
in 5 min after aminolevulinic acid administration
oactivity appeared in the CO-binding particles
oth endoplasmic reticulum fractions and reached
ximum in 30 min with the rates of incorporation
same in the rough and smooth fractions; ^{3}H-leucine
rporation was rapid with maximum specific acti-
(cpm/mg protein) for rough endoplasmic reticulum
rring at 10 min (14000) and for smooth endoplasmic
culum at 20 min (15000). The decrease of radio-
vity with time from these fractions was biphasic
of the fast phase was 7 hr and of the slow phase
r) indicating the presence of at least 2 hemopro-
s. An excellent correlation between the ratios
adioactivity and CO-binding pigment in rough/
th fractions (0.70 and 0.68, resp.) supports the
thesis that the radioactivity found in the CO-
ing particles is incorporated only into the CO-
ing pigment.

PROGESTERONE METABOLISM IN REGENERATING
RAT LIVER. *(E.)* Crane, M. (Harvard Med.
, Boston, Mass.), J. Loring and C. A. Villee.
crinology 87(1):80-83, 1970.

The activities of specific hepatic enzymes (female rat) concerned with the metabolism of progesterone were examined following partial hepatectomy during the process of regeneration. The activities of these enzymes decreased 10% within 16 hr following partial hepatectomy and became undetectable 4 to 5 days postoperatively. Enzymatic activities began to reappear at about the 7th day (60%) and had reached normal levels by the 60th day of regeneration. Hence, following hepatectomy, all the metabolic energy of the liver is probably turned toward the regenerative process. The fraction of the radioactivity present in the several metabolites from incubations of progesterone with liver tissue 7 days postoperatively suggests that ring A reductases appear earlier than the 20α-steroid reductase.

6454 KINETICS OF INDOCYANINE GREEN REMOVAL FROM THE BLOOD. *(E.)* Paumgartner, G. (Clin, U. Vienna, Austria), P. Robst, R. Kraines and C. M. Leevy. *Ann NY Acad Sci* 170(1):134-147, 1970.

The kinetics of the removal of indocyanine green (ICG) dye from the blood were studied in 29 male rats which received one of 6 doses of dye (0.25, 0.5, 1.0, 1.5, 2.0 and 2.5 mg/100 g), injected through a jugular catheter. Blood samples were collected at 0, 2, 3, 4, 5, 6, 9, 12 and 15 min after injection and were analyzed by spectrophotometric methods for ICG concentration and clearance rate. Initial fractional clearance decreased progressively from 0.447 mg/min to 0.100 mg/min, when the dose of ICG was increased from 0.25 to 2.5 mg/100 g. Removal of ICG increased with the dose of dye administered in a nonlinear fashion. Application of the Michaelis-Menten equation to the data obtained a maximum initial dye removal rate of 0.29 mg/100 g/min and a Km of 0.39. Intragastric administration of 0.2 ml of carbon tetrachloride produced a 70% decrease (from 0.29 to 0.09 mg/100 g/min) in the maximum initial dye removal rate, which returned to normal within 8 days. Hepatic uptake of ICG was directly measured by injection of I^{131}-serum albumin prior to dye injection, and by determination of radioactivity in blood and in liver homogenates. Application of the Michaelis-Menten equation to the data showed a maximum hepatic dye uptake of 6.54 mg/100 g liver/min, and a Km of 0.44. In rats injected with crystalline bilirubin (2mg/100 g i.v.) or with rifamycin SV (3 mg/100 g), there was no significant change in the maximum hepatic uptake of the dye. The Km in rats receiving bilirubin increased to 1.29 compared to a control value of 0.42, and increased in rats receiving rifamycin SV to 3.02 from a control value of 0.40 The Km increase indicates a competitive inhibition of dye uptake.

SECRETION AND METABOLISM

Intestine

6492 STUDIES ON THE PHOSPHOLIPASES OF RAT INTESTINAL MUCOSA. *(E.)* Subbaiah, P. V. (Dept. Biochem. Indian Inst. Sci., Bangalore, India) and J. Ganguly. *Biochem J* 118(2):233-239, 1970.

Subcellular distribution and some characteristics of the phospholipases of rat intestinal mucosa were studied by following their activity levels (phospholipase B and lysolecithinase activities were determined by the method of Skidmore and Entenmann and phospholipase A activity was determined by the method of Subbaiah, Raghavan, and Ganguly). Whole mucosal homogenates were active (μEq/hr/mg protein) against lecithin (0.40), lysolecithin (3.50), and cephalin (2.10) substrates, and when the homogenates were fractionated, 62.3% of total phospholipase A activity was found in the microsomal fraction while both phospholipase B and lysolecithinase activities were divided between the microsomal (26% and 34%, resp.) and soluble (47% and 45%, resp.) fractions. Mucosa fractionation revealed 43.2% and 42.0% of phospholipase A activity in the brush border and brush-border-free particulate, and 25% and 37% of phospholipase B activity and 40% and 45% of lysolecithinase activity in the brush-border-free particulate and soluble fractions, resp. Phospholipase A pH optimum was 8.6 (Tris-maleate buffer) and phospholipase B and lysolecithinase both had an optimum of 6.5 (phosphate buffer). Effects of deoxycholate, potassium oleate, calcium ion, EDTA, p-hydroxymercuribenzoate, heating and acetone-butanol drying in activating and inhibiting the enzymes showed phospholipase A and phospholipase B activities to be markedly different while phospholipase B and lysolecithinase activities were more similar. When lecithin with 1-^{14}C-oleic acid in the β-position was used as substrate for phospholipase A (*Crotalus adamenteus* venom) 94.5% of the radioactivity appeared in the free fatty acids released (thin layer separation), indicating the specificity of phospholipase A for the β-ester linkage.

6493 FATTY ACIDS IN THE LUMEN OF THE SMALL INTESTINE OF MAN FOLLOWING A LIPID-CONTAINING MEAL. *(E.)* Eastwood, M. A. (Roy. Infirm., Edinburgh, Scotland) and D. Hamilton. *Scand J Gastroent* 5(3):225-230, 1970.

The concentration patterns of fatty acids along the small intestine were studied for 3 hr following the ingestion of a triglyceride-containing meal in 6 normal human subjects, aged 21 to 34 years. The test meal was an emulsion of skim milk, cream, whole milk products incubated with rennet, and 2.0 g of polyethylene glycol added for protein absorption measurements. Gastric emptying time was measured and determination of amount of dietary lipid, α-amino nitrogen and polyethylene glycol from intestinal aspirates were made. In 2 subjects, the rate for gastric emptying of lipids was not uniform, but in all subjects there was nearly 100% gastric emptying within 3 hr. The initial concentrations of free fatty acids diminished over the 3 hr at all levels of the intestine, and decreased with the distance of the sample site from the nose. In one subject, the concentration (μmoles/ml) of free fatty acids, sampled at a site 190 cm from the nose decreased from a value of 22 at the first hour to 9 at the second hour and to 4 at the third hour; and at a sample site 225 to 260 cm from the nose, the three respective hourly values were 7.9, 1.3 and 3.0 μmoles/ml. At all sampling sites in all subjects, there was only a small concentration of glycerides (range: 0.10 to 2.12 μmoles/ml) due to efficient absorption. There was also a significant correlation between the proportions of individual free fatty acids in the small intestine and the fatty acids of the dietary triglycerides. The molar ratio of oleic acid to stearic acid in the test meal was 2.3 and a sample site distance of 80 to 100 cm from the nose the ratio was 2.0 at the first hour, 1.8 at the second hour and 1.8 at the third hour following meal ingestion, showing that oleic acid is more efficiently absorbed than stearic acid, although at a sample site distance of 200 to 270 cm, the ratio values for these three times were 1.1, 1.3 and 1.0, resp.

6494 EFFECT OF DIETARY PROTEIN ON THE ENZYME FROM RAT AND HUMAN INTESTINE WHICH CONVERTS β-CAROTENE TO RETINAL. *(E.)* Gronowska-Senger, A. (Dept. Hyg., Warsaw Agric. U., Poland) and G. Wolf. *J Nutr* 100(3):300-308, 1970.

The influence of dietary protein on carotene dioxygenase, the intestinal enzyme which converts β-carote to retinal, was studied in intestinal mucosal extrac from young male human subjects and also from rats fe normal diets and diets with varying protein concentr tions. Rats were maintained on a normal 20% protein diet, or on a 5, 10, or 40% protein diet with casein replacing sucrose. Human subjects were fed either a *ad lib* diet or a low protein diet for 8 to 9 days. Both human subjects and experimental animals were fasted for 12 hr before duodenal mucosal specimens w obtained and assayed for carotene dioxygenase (Goodm method). Enzyme levels for male rats pair-fed on 5, 10, 20 and 40% protein intake were resp., 1.24, 3.36 2.10, and 1.60 μmoles/mg protein from the supernatan fractions. Enzyme levels for female rats fed *ad lib* were 5.20 and 3.34 μmoles/mg protein from the supernatant fraction. In both sexes and in pair-fed and *ad lib* feedings, the maximal activity of enzyme leve per total mucosa and per DNA cell content was reached at a 10% protein intake level rather than at the normal 20% protein dietary level. The possibili of an existing coenzyme or of a decreased pancreati secretion was ruled out by subsequent testing. Prot synthesis and polyribosome aggregations were highest in rats fed a 10% protein diet. The maximum protei incorporation value of ^{14}C-leucine at 15 min incubation was 2200 cpm for microsomal preparations from on the 10% protein diet, and for rats on the 20% an 40% diets the corresponding values were 1200 cpm an 800 cpm, resp. Duodenal mucosa obtained from norma human volunteers on the protein-free diet showed sp cific enzyme activity similar to that in rat mucosa but there was no significant difference in enzyme activity between the protein-free and the control s jects.

GENERAL

97 THE ANAEROBIC BACTERIAL FLORA OF THE MOUSE
CECUM. *(E.)* Gordon, J. H. (Rockefeller U.,
d R. Dubos. *J Exp Med* 132(2):251-260, 1970.

e anaerobic species of bacterial flora present in
e cecum of specific-pathogen-free mice (COBS-CD-1
rain) were studied using refinements of a method
sed on Moore's modification of Hungate's anaerobic
lture technique. The main modifications of this
y anaerobic culture technique utilize a prereduced
ar culture medium and also the removal of all
aces of oxygen from the gases used by passage
rough a hot copper oven. The most common morpho-
gic type of bacteria observed by this method were
tapered rods, which formed characteristic "speck-
d" or "mosaic" colonies on agar plates. The
rphologic forms of bacteria observed included large
ered rods, tapered rods with visible flagella,
oreformers, "doughnut-shaped" rods, and "spiral"
ganisms. Bacteria species of the genera *Fuso-
terium*, *Eubacterium* and *Clostridium* were iden-
ied, but most of the anaerobic cultures belonged
species that have not yet been identified. This
, modified process yielded a greater variety of
terial types and more numerous colonies than did
older, previously used method. With the old
hod, only the smaller tapered organisms appeared
the agar plates, although larger ones, with and
hout spores, were observed under the phase micro-
pe. The new technique allowed cultivation of two
the larger tapered varieties and also of a tapered
with spores.

8 INTESTINAL VASCULAR RESPONSES TO GUT PRESSURE
AND ACETYLCHOLINE *IN VITRO*. *(E.)* Brobmann,
F. (U. Oklahoma Med. Ctr., Oklahoma City), E. D.
obson and G. A. Brecher. *Angiologica* 7(3):129-139,
0.

effect on blood flow of active and passive eleva-
n of intraluminal pressure, and acetylcholine in
denervated gut was studied in an *in vitro* prepara-
n of ileum segments from mongrel dogs of both sexes
to 20 kg), where the vessels were perfused with
or blood from a reservoir. Blood flow increased
n acetylcholine and decreased with elevated gut
ssure whether induced actively or passively.
thmical alterations of intraluminal pressure
sively did not increase blood flow by a "massage
ect" over that existing at a corresponding constant mean pressure. With each rhythmical pressure rise arterial inflow decreased and venous outflow increased whereas the reverse occurred with each pressure drop. Loss of vascular and visceral tonus by poisoning the tissue with sodium azide resulted in a marked increase in blood flow. Stepwise pressure elevations in the lumen of the poisoned gut counteracted the flow systematically. Resistance to intestinal blood flow apparently is consistently raised by active as well as passive gut pressure elevations, and the vasodilation induced by acetylcholine is opposed by these mechanical effects to varying degrees.

6499 MESENTERIC VASOACTIVITY ASSOCIATED WITH EATING AND DIGESTION IN THE CONSCIOUS DOG. *(E.)* Vatner, S. F. (Dept. Med., U. California, San Diego), D. Franklin and R. L. Van Citters. *Amer J Physiol* 219(1):170-174, 1970.

Mesenteric blood flow, arterial pressure and cardiac output were studied in conscious dogs at rest and after feeding to elucidate the mechanisms involved in the vascular changes associated with eating. Ultrasonic or electromagnetic flowmeters were placed around the ascending aorta and mesenteric artery and systemic pressure monitored by chronically implanted gauges so that recordings were made both before and for 2 to 7 hr following feeding. Anticipation and ingestion of food produced increases in cardiac output (63%), heart rate (78%) and aortic pressure (31%) whereas mesenteric flow transiently fell (10%). Within 5 to 15 min after ingestion, mesenteric flow began to rise and continued to increase until 50 to 60 min post-prandially when it returned to control values. Mesenteric postprandial dilatation was evident both after adrenergic blockade from phenoxybenzamine (15 mg/kg, i.v.) and propranalol (3 mg/kg), but did not occur following atropine administration (0.1 to 0.2 mg/kg).

6500 EFFECTS OF DISTENSION AND ACETYLCHOLINE ON INTESTINAL BLOOD FLOW *IN VIVO*. *(E.)* Brobmann, G. F. (U. Oklahoma Med. Ctr., Oklahoma City), E. D. Jacobson and G. A. Brecher. *Angiologica* 7(3):140-146, 1970.

Determination of blood flow changes with mechanical inflation of the intestine and the effects of acetylcholine (ACh) on blood flow *in vivo* were investigated in dogs (15 to 20 kg). Blood flow was measured by electromagnetic flowmeter in a branch of the superior mesenteric artery to an ileal segment and arterial pressure and venous outflow was also recorded from the segment. ACh (0.4 μg) was injected at a close intra-arterial site. An air pump was connected to the isolated segment, tied at both ends, to provide mechanical distension. At 0 intraluminal pressure, arterial inflow and venous outflow were 8 ml/min. With a rise in gut pressure to 40 mm Hg, both arterial and venous flow decreased (to 6 ml/min) at first (for 1/2 min) following which arterial flow began to rise although without a return to control values. ACh produced hyperemia during gut distension and enhanced blood flow for several minutes. These findings correlate with results from similar *in vitro* experiments.

6501 THE LYMPHATIC PUMP OF THE INTESTINAL VILLUS OF THE RAT. *(E.)* Collan, Y. (2nd Dept. Path., U. Helsinki, Finland) and T. V. Kalima. *Scand J Gastroent* 5(3):187-196, 1970.

The structure of the lymphatic system of the intestinal villus was studied by electron microscopy in 5 rats. In the apical part of the villus, semicircular folds with no fibrillar structure in the outer walls were observed and when the visible portions of 18 lymph vessels were examined, the 72 junctions were found which could be classified as valve-like or more complicated. A thick network of collagen fibers in the subepithelial capillary system extended into the lamina propria and joined the network of fibers surrounding the lymphatics, and anchoring filaments were attached to fibroblasts, Schwann's cells, muscle cells, macrophages, and mast cells while mobile cell components had no fibrillar structures surrounding them. Muscle cells were always located perilymphatically and seemed to be connected to the lymphatic cells in some places through anchoring filaments, further substantiating the lymphatic pump concept.

6502 DECREASED ESTERIFICATION OF [^{3}H] CHOLESTEROL BY SERUM FROM PARTIALLY HEPATECTOMIZED RATS *IN VITRO*. *(E.)* Fex, G. (Dept. Chem., U. Umea, Sweden), and L. Wallinder.

The esterification of [^{3}H] cholesterol by serum from partially hepatectomized and intact control rats *in vitro* was compared. Less [^{3}H] cholesterol was esterified by serum from partially hepatectomized rats compared with the unoperated control rats, the esterification after a 4 hr incubation time being 2.69 ± 0.23 and 3.97 ± 0.15%, resp. Surgical trauma did not influence the capacity of the serum to esterify cholesterol, as the inclusion of sham operated rats into the experiment gave similar results. The decreased cholesterol esterifying activity of serum from partially hepatectomized rats probably explains why these rats have a low concentration of plasma cholesterol ester.

6503 *IN VITRO* ASSAY OF THE EFFECT OF ANTIBACTERIAL TREATMENT OF THE INTESTINAL FLORA ON BONE MARROW CELL PROLIFERATION: I. DIAGNOSTIC PROCEDURES

6516 ENDOSCOPIC CANNULATION OF THE AMPULLA OF VATER. *(E.)* Takagi, K. (Cancer Inst. Hosp., Tokyo, Japan), S. Ikeda, Y. Nakagawa, K. Kumakura, M. Maruyama, N. Someya, T. Takada, T. Takekoshi and T. Kin. *Endoscopy* 2(2):107-115, 1970.

Endoscopic cannulation of the ampulla of Vater was attempted in 20 patients under general anesthesia, using a fiberduodenoscope and X-ray television fluoroscopy. In 13 of the 20 patients the ampulla of Vater was successfully observed, and in 9 of these patients, the ampulla was cannulated with a polyethylene tubing and 5 cc of 60% Urografin was injected as contrast medium. Confirmation of the ampulla of Vater was made by observing the excretion of clear pancreatic juice and bile following an i.v. injection of pancreozymin. In 9 patients undergoing the cannulation, pancreatography was done in 3 patients, and in 6 cases both pancreatography and cholangiography was performed. In all 9 cases stones were observed in the common bile duct or in the gallbladder. Of the 7 cases in which the ampulla was not observed, 4 had cancer of the head of the pancreas and duodenum which compressed the duodenum and made observation of the ampulla difficult; in 2 of the 4 cases the lesion could be observed and was diagnosed as cancer. Following examination, many patients had abdominal inflation but no bleeding or perforation of the digestive tract. Following pancreatography, 5 patients had an increased serum amylase value of 1000 to 3000 U, which returned to a normal level within 5 to 7 days.

6517 FIBERDUODENOSCOPIC OBSERVATION ON THE DYNAMICS OF THE DUODENAL PAPILLA. *(E.)* Kozu, T. (Tokyo Women's Med. Coll., Japan), I. Oi., S. Suzuki and T. Takemoto. *Endoscopy* 2(2):99-102, 1970.

The dynamics of bile excretion and localized changes in the duodenal papilla were directly observed in patients by endoscopic examination, using the fiberduodenoscope. The patients were premedicated with an epilocaine solution for localized pharyngeal anesthesia and by 20 mg of Buscopam (i.m.), prior to examination. With the patient in the left lateral position, the fiberduodenoscope was inserted deep into the duodenal canal to observe the duodenal papilla. The characteristic appearance of the duodenal papilla is a hemispheric protrusion on the longitudinal fold associated with proximal circular folds and distal frenulum-like longitudinal folds. The papilla has an orifice on the summit and is distinguished from the surrounding tissue by its reddish to pale white discoloration. During the endoscopic examination of patients treated with pancreozymin (1 U/kg), the papilla was observed to exhibit spontaneous alternating, contracting and relaxing movements, with opening and closing of the orifice. Following this, there was a vigorous excretion of thick bile in large amounts and the orifice opened widely and became flaccid, and there was periodic deepening of color. In some cases a volvular protusion believed to be a septum between the bile duct and the pancreatic duct was observed protruding from the orifice during excretion phase. Patients with normally functioning gall bladders showed initiation of bile secretion 2 min after injection with pancreozymin, and bile continued to flow for 10 min.

6518 SERUM HEPATITIS ANTIGEN (SH): RAPID DETECTION BY HIGH VOLTAGE IMMUNOELECTROOSMOPHORESIS. *(E.)* Prince, A. M. (New York Hosp.-Cornell Med. Ctr., New York) and K. Burke. *Science* 169(3945):593-595, 1970.

An immunoelectroosmophoretic technique (IEOP) for rapid detection of antigen (SH) associated with serum hepatitis virus is presented. The technique maintains the specificity characteristic of the Ouchterlony gel-diffusion method, yet detects in 1 to 2 hr, one tenth the amount of antigen required for gel diffusion. The Ouchterlony technique currently in use, has two disadvantages in the present application in that it is relatively insensitive, detecting only 20-30% of serum hepatitis carriers in blood donor group populations and is a relatively slow test, requiring 1-7 days for definitive interpretation. Now in the high voltage electroosmophoretic technique, the antigen is caused to migrate in an electric field through a suitable medium of diffusion against a stream of antibodies migrating in opposite directions as a result of endosmotic flow. The IEOP test and standard Ouchterlony technique were compared using 1023 serums and in all instances, serums were positive for SH antigen by both techniques. The IEOP technique detected additional carriers in most populations tested. The IEOP test offers a practical, rapid, sensitive, and highly specific approach to screening blood donors for carriers of serum hepatitis virus.

6519 ENDOSCOPIC PANCREATOCHOLANGIOGRAPHY. *(E.)* Oi, I. (Tokyo Women's Med. Coll., Japan), S. Kobayashi and T. Kondo. *Endoscopy* 2(2):103-106, 1970.

The Machida Fiberduodenoscope has been successfully used to perform endoscopic pancreatocholangiography in the diagnosis of cancer of the pancreas and biliary system in 50 patients. With the patient in the left lateral position, the fiberduodenoscope was inserted into the duodenum under local pharyngeal anesthesia. Then, under fluoroscopic control, a catheter was cannulated into the duodenal papilla and 2 to 4 ml of 60% Urographin was injected into the pancreatic duct as a radiocontrast medium. The cannulated catheter was then directed to the common bile duct and the biliary system was directly opacificed. The use of endoscopic cholangiography in 50 patients resulted in diagnoses of 4 cases of cancer of the pancreas head, 3 cases of cancer of the bile duct, 2 cases of cancer of the pancreas body, one case of hepatoma, and several cases of gallstones in the common bile duct or gallbladder.

6520 SYSTEMATIC RECTOSIGMOIDOSCOPY IN THE DETECTION OF RECTAL CANCER. *(Fr.)* Muller, C. A. (Lausanne, Belgium). *Lyon Med* 65(5):708-712, 1969.

Fifty-three adenomatous polyps and 25 carcinomas of the rectosigmoid region were discovered in the proctosigmoidoscopic examination of 710 patients aged forty or above. Analysis of the results indicate that adenomatous polyps of this type tend to develop approximately 10 yr earlier than was the case a quarter of a century ago. Diagnosis of corectal malignancies in the preclinical stages would seem to be greatly abetted by testing for occult blood in stools of doubtful color from asymptomatic patients and by rectosigmoidoscopic examinations.

6521 A SPECTROPHOTOMETRIC METHOD FOR THE ANALYSIS OF PEPSIN. *(E.)* Robinson, L. A. (U. Washington Sch. Med., Seattle) and T. T. White. *Gastroenterology* 58(6):798-800, 1970.

A rapid spectrophotometric method for the analysis of pepsin in gastric secretion, using p-nitrophenyl sulfite as a synthetic substrate, has been developed. P-Nitrophenyl sulfite is rapidly hydrolyzed by incubation with pepsin and the rate of increase of absorbance of the breakdown product, p-nitrophenol, is maximal at 320 nm and is directly (linearly) proportional to the enzyme concentration. The maximal rate of change of absorbance is taken as a measure of the total amount of pepsin activity in the sample cuvette. A dual beam spectrophotometer is used to reduce the artifact of nonenzymatic hydrolysis of the ester. A standard pepsin solution is prepared by dissolving crystalline pepsin (1 mg/ml) in 50% glycine and 50% 0.01 N HCl (pH 2). A sample of 10 µg of pepsin changes the absorbance at a constant rate of 0.305 per min. One determination can be performed in 3 to 4 min and a sample containing as little as 1 µg of pepsin can be assayed accurately. This method is more rapid than the standard Anson and Mirsky (hemoglobin digestion) assay for pepsin, and a comparison of the two methods by the simultaneous assay of 50 gastric specimens showed both methods to be equally accurate.

6522 THE VALUE OF EEG FREQUENCY ANALYSIS IN HEPATIC ENCEPHALOPATHY. *(E.)* Hawkes, C. H. (Roy. Infirm., Edinburgh, Scotland), A. I. S. Macpherson, H. Pryor and H. R. A. Townsend. *J Roy Coll Surg Edinb* 15(3):151-157, 1970.

Frequency analyses of electroencephalographic recordings were regularly obtained from a 67 year old housewife with severe hepatic dysfunction and portal hypertension, and were used to indicate the onset of encephalopathy before it became clinically or biochemically manifest. The EEG was continuously recorded from the right temporo-occipital area and autocorrelograms were obtained by computer analysis o indicate the change in mean dominant frequency. n normal patients the mean dominant frequency of he EEG is always greater than 8 cycles per sec. When pre-coma was clinically evident in this patient, he mean dominant frequency levels reached levels f 2 to 3 cps (delta range) and when it was clinically latent", the values were in the 4 to 8 cps range theta range). It was observed that a slowing of he mean dominant frequency to the theta range ccurred 48 hr before the clinical symptoms of ncephalopathy. Treatment with neomycin (6g/day) esulted in an increase in the pre-coma mean domiant frequency from a value of 3 cps to 9 cps.. hen neomycin therapy was stopped and protein dietary intake was re-introduced at 30 g/day, the mean dominant frequency dropped from a value of 9 cps to 7 cps in 5 days, and with the renewal of neomycin therapy at a lower dose of 3 g/day there was a gradual recovery of the mean dominant frequency to 8 cps in 7 days. Lactulose (30 ml t.i.d.) was gradually substituted for neomycin therapy, and even when the protein intake was raised to 40 g/day, the mean dominant frequency was maintained at a normal level of 8 to 9 cps until the patient was discharged.

6523 GLUCOSE TOLERANCE TEST AND SIMULTANEOUS SERUM AMYLASE DETERMINATION IN THE DIAGNOSIS OF PANCREATIC DISEASES: A STUDY IN 100 PATIENTS. *(Fr.)* Thomas, M. (Hosp. Bichat, Paris, France), A. Lapegue and Y. Le Quintrec. *Ann Med Intern* 121(4):421-430, 1970.

Oral glucose tolerance tests and serum amylase determinations were performed on 37 controls, 25 verified pancreatic disease affected patients (chronic pancreatitis, cancer), and 38 patients whose pancreatic disorders could not be established (lack of calcifications or surgical evidence). A slightly modified Ermini's technique was used. The tests were negative in 3 cases and positive in 16 out of 25 cases with confirmed pancreatic disease. Out of 37 controls, 4 gave false positive results while 19 cases were negative. The test explores the functional condition of the pancreas whose alterations preceed macroscopic changes (radiologically visible calcifications).

GASTROINTESTINAL DISEASES

ESOPHAGUS

5579 PRIMARY MALIGNANT MELANOMA OF THE ESOPH-
AGUS ASSOCIATED WITH MELANOSIS OF THE
ENTIRE ESOPHAGUS: FIRST CASE REPORT. *(E.)* Piccone,
/. A. (Brooklyn VA Hosp., N. Y.), R. Klopstock,
I. H. LeVeen and J. Sika. *J Thor Cardiovasc Surg*
59(6):864-870, 1970.

he fourth reported case of primary malignant
elanoma of the esophagus associated with esoph-
geal melanosis and the first with melanosis of
he entire esophagus is reported. An esophagram
f a 70 yr old white man with a history of heavy
thanol intake and episodic anterior chest pains
ssociated with the swallowing of solid food
howed a 4 cm polypoid mass at the junction of the
id and distal thirds of the esophagus. Bluish-
lack pigmented areas throughout the esophagus
nd a 2 to 3 cm polypoid lesion 35 cm from the
ncisor teeth were seen on esophagoscopy. A
iopsy and permanent sections showed squamous
ucosa with the underlying tissue infiltrated by
he pleomorphic polygonal and spindle-shaped cells
aving vesicular nuclei and granules of brown non-
ron containing pigment. No melanoma-like skin
esions were found and none had been removed in
he past. Esophagogastrectomy was performed and
he distal half of the esophagus, the upper third
f the stomach and the left gastric nodes were
esected. Microscopic examination of the resected
pecimen showed malignant melanoma of the esophagus
ith metastasis to the submucosa and to the para-
sophageal lymph nodes. The patient was asymptomatic
or 6 months. Postmortem examination revealed meta-
tatic melanoma in the esophagus, stomach, mediastinal
ymph nodes, thoracic vertebrae, lungs, pleura, left
reter, kidney, liver, diaphragm and skin.

580 ROTATORY IRRADIATION OF ESOPHAGEAL CAR-
CINOMA. *(Ger.)* Werner, H. (Radiol. Clin.
Kiel, Germany) and R. Lucks. *Strahlentherapie*
39(5):517-526, 1970.

sophageal carcinoma in 155 patients (average age
.7 years) treated by rotatory irradiation under
nventional intense care conditions was followed
from 1958 through 1966. Esophagoscopic control
as carried out in 87% of the cases, while 76% had
stologically ascertained carcinomas; 93% under-
ent uninterrupted therapy. A one year survival
ate was achieved in 36% of cases, 2 years in 20%
patients, 3 years in 9%, 4 years in 9%, 5 years
9% and 6 years survival was achieved in 8% of
is population. Rotatory irradiation therapy
ould occupy an important place comparable to
balt therapy in cases of esophageal carcinoma.

81 ESTIMATION OF AVERAGE DENSITY OF LUNG BY A
RADIOGRAPHIC TRANSIT DOSE METHOD AND COR-
CTION FACTORS FOR A LESION IN THE MIDTHORACIC ESO-
AGUS TREATED WITH ROTATION OF 4.3 MV X-RAYS AND
BALT-60 γ-RAYS. *(Jap.)* Onai, Y. (Cancer Inst.,

507 REDISTRIBUTION OF SQUAMOUS AND COLUMNAR
EPITHELIUM AFTER GASTRIC MUCOSAL WOUNDS
THE RAT. *(E.)* Wong, J. (Dept. Surg. U. Sydney,
stralia) and E. S. Finckh. *Pathology* 2(2):147-159,
70.

male albino rats were used to study the effect
epithelial and full mucosal wounds produced by
amping across the squamo-columnar junction of
e stomach in 3 positions relative to the junc-
on. When the wound included equal areas of the
types of mucosa, healing restored the junction
its original position irrespective of the depth
wounding. When predominantly glandular mucosa
s damaged, wounds of both depths healed with de-
ation of the junction towards the glandular area.
en predominantly squamous mucosa was damaged,
aling resulted in deviation of the junction into
e squamous part of the stomach when the wounds
re deep, but in return of the junction to its
iginal position when the wounds were superfi-
al. This difference between the effects of su-
rficial and deep wounding was confirmed by ex-
riments in which the wall of the stomach in the
nctional area to be damaged had previously been
tated surgically through 90 degrees. It is sug-
sted that in deep wounds involving the whole of
e mucosa, the rate of migration of the two types
epithelium was the principal factor determining
e final distribution of the two distinct types
mucosa, but that in superficial wounds the re-
dual mesenchyme of the lamina propria, at least
the squamous side, influenced the type of
ithelial cells which migrated across it and
came established over it.

08 METABOLISM OF GLYCOCHOLIC ACID IN
GASTRECTOMIZED PATIENTS. *(E.)*
dtvedt, T. (Govt. Hosp. Oslo, Norway), A.
rman and K. Nygaard. *Scand J Gastroent*
3):237-240, 1970.

e extent of hydrolysis of glycocholic acid was
udied in 5 gastrectomized patients with increased
mbers of bacteria in jejunal aspirates; disap-
arance of [1-^{14}C] glycine from [24-^{14}C] labeled
le acid was determined after administration of
4-^{14}C]-cholyl-[1-^{14}C]-glycine. Jejunal contents
all patients obtained 24 hours after adminis-
ation, contained from 82-98% of [24-^{14}C] labeled
le acids with conjugates other than the original
^{14}C] glycine. Labeled bile acids were not
esent as unconjugated bile acids except in 2
tients (trace amounts). Unconjugated bile acids
tained after alkaline hydrolysis of 48 hr
junal contents) were separated and labeled
,12α-dihydroxy-7-keto-5β-cholanoic, and 3α,7β,-
α-trihydroxy-5β-cholanoic acids were isolated.
ese metabolites were formed in all patients,
as a group, never accounted for more than 5%
total [24-^{14}C] labeled bile acids in the sample.
extensive splitting of glycine conjugates appar-
tly is not necessarily accompanied by steatorrhea
increased deconjugation of glycine conjugates
ed not be associated with increased transformation
bile acids.

6609 SUCTION BIOPSY AND GASTRITIS: RESULTS OF 609 HISTOPATHOLOGICAL INVESTIGATIONS. *(Ger.)* Davaris, P. S. (Path. Inst. U. Dusseldorf, Germany). *Aertzl Forsch* 24(6):178-182, 1970.

Suction biopsies of the gastric mucosa performed on 609 gastritis patients (1345 samples) permitted 92.7% definite histological diagnosis. Esophageal mucosa was aspirated in 5% of the patient population which excludes esophageal varicoses from this procedure. Normal mucosa was found in 29.6% while 47.5% revealed superficial gastritis and 22.8% had atrophic gastritis with intestinal metaplasia as well in patients over 40 years of age. Histologically normal gastric mucosa decreased with aging and atrophic gastritis was also more frequent, while no relevance to age was found for superficial gastritis. Sex had no influence on the severity of gastritis.

6610 THE EFFECT OF LIMITED ADMINISTRATION OF N-METHYL-N'-NITRO-N-NITROSOGUANIDINE ON THE INDUCTION OF STOMACH CANCER IN RATS. *(E.)* Fujimura, S. (Natl. Cancer Ctr. Res. Inst., Tokyo, Japan), K. Kogure, T. Sugimura and S. Takayama. *Cancer Res* 30(3):842-848, 1970.

The incidence and development of adenocarcinomas of the glandular stomach following *N*-methyl-*N*'-nitro-*N*-nitrosoguanidine (NG) administration in male rats is reported. Two groups of 30 animals each received 83 μg/ml and 167 μg/ml NG solution for 7 months followed by tap water. A third group of 40 rats received the higher dose until the end of the experiment, when histological examination was made. Almost all tumors of the stomach were localized in the lesser curvature of the pylorus or antrum although tumors were also found in the duodenum, upper jejunum and in the omentum and peritoneal cavity. Atypical epithelial proliferation in the stomach was commonly observed although metastases were not noted. In the liver, central necrosis with vacuolar degeneration and cirrhosis-like lesions in 3, 11 and 14 cases in each respective group were noted. NG administration in drinking water at lower concentration appeared more likely to produce carcinomas in the stomach and the rate of survival was higher than in those receiving the higher dose. Tumors of duodenum and jejunum were more frequent in the second and third groups.

6611 MESENTERIC ISCHEMIA: A CAUSE OF INCREASED GASTRIC BLOOD FLOW, HYPERACIDITY, AND ACUTE GASTRIC ULCERATION. *(E.)* Boley, S. J. (Albert Einstein Coll. Med., New York, N.Y.), M. I. Cohen, P. R. Winslow, N. H. Becker, W. Treiber, H. McNamara, F. J. Veith and M. L. Gliedman. *Surgery* 68(1):222-230, 1970.

The effects of acute mesenteric ischemia on gastric blood flow and acid was studied in 17 dogs (10 to 22 kg) under pentobarbital anesthesia. Electromagnetic flowmeters and hydraulic occluders were placed on the celiac, superior mesenteric (SMA) and left gastric or gastroduodenal arteries. Systemic arterial pressure was also recorded and gastric juice collected at 15 min intervals by aspiration. Blood flow in the left gastric and gastroduodenal arteries changed in direct proportion to celiac artery flow. Celiac flow increased (240% mean) with SMA flow decreased 50% for 1 hr and occluded for 30 min thereafter while total acid secretion increased by a mean 1200%. With SMA flow decreased 50% for 12 hr, celiac flow increased by a mean 95% with a 970% rise in total acid. Ligation of pancreaticoduodenal artery concurrent with reduced SMA flow produced minor celiac artery flow changes (6% decrease) and only a small (20%) decrease in acid concentration. Control dogs observed for 12 hr without SMA flow changes showed steady celiac blood flow and unchanged acid secretion. Acute mesenteric ischemia or occlusion produced a rise in celiac and gastric blood flow which appeared to be a response to the fall in mesenteric artery pressure since the changes were minimized with ligation of the major artery connecting the mesenteric and celiac vascular beds.

6612 EFFECT OF LONG TERM ANTICHOLINERGIC THERAPY ON GASTRIC ACID SECRETION, WITH OBSERVATIONS ON THE SERIAL MEASUREMENT OF PEAK HISTALOG RESPONSE.

(E.) Norgaard, R. P. (U. Texas Southwestern Med. Sch., Dallas), D. E. Polter, J. W. Wheeler, Jr. and J. S. Fordtran. *Gastroenterology* 58(6):750-755, 1970.

Thirty-three male ulcer patients and normal subjects were randomly allocated for long term oral therapy with placebo, poldine (Nacton) or glycopyrrolate (Robinul) in order to study response to gastric acid secretion. At specific intervals, treatment was interrupted temporarily for 48 hr, so that functional parietal mass could be assessed by means of peak secretory response to histalog. Oral treatment with anticholinergic drugs for 6 to 18 months did not result in significant depression of functional parietal mass. Prolonged treatment with anticholinergic drugs did not potentiate the antisecretory action of these agents on histalog-stimulated acid secretion. Patients on long-term placebo therapy had as much reduction in acid secretion by Nacton or Robinul as did patients who had received active drugs for 6 to 18 months. Serial observations in individual subjects suggest that the functional parietal cell mass in some ulcer patients and in some normal subjects may change drastically over a relatively short period of time; these variations are seemingly unrelated to anticholinergic therapy.

6613 GASTRIC JUICE LACTIC ACIDOSIS IN THE PRESENCE OF GASTRIC CARCINOMA. *(E.)*

Piper, D. W. (Dept. Med., U. Sydney, Australia), M. L. Kemp, B. H. Fenton, M. J. Croydon and A. D. Clarke. *Gastroenterology* 58(6):766-771, 1970.

Basal lactic acid content of gastric secretion was studied in 138 gastric ulcer patients, 70 control subjects, and 39 gastric carcinoma patients. Two of 138 gastric ulcer patients and none of 70 controls had concentrations of basal lactic acid above 100 μg/ml; of 39 carcinoma patients, 22 had lactic acid concentrations above this level. Glucose infusions resulted in a slight rise in lactic acid content of gastric juice; this rise was greater in carcinoma patients than in controls and gastric ulcer patients (the mean rise was 66.8, 6.1, and 26.6 μg/ml, resp.). The rise of lactic acid content of gastric juice was unrelated to a rise in blood sugar after glucose administration. Fructose infusions resulted in a marked rise in lactic acid concentration in approximately 70% of the carcinoma group. Extent of lactic acidosis of the gastric juice was unrelated to the size or site of the carcinoma, its histologic type, or to pH, volume, secretory rate, acid concentration, or sodium content of gastric juice.

6614 INFLUENCE OF ACHLORHYDRIA ON ASPIRIN-INDUCE OCCULT GASTROINTESTINAL BLOOD LOSS: STUDIES IN ADDISONIAN PERNICIOUS ANEMIA. *(E.)*

St. John, D. J. B. (Dept. Med., Monash U., Melbourne, Australia) and F. T. McDermott. *Brit Med J* 2(5707):450-452, 1970.

The effects of aspirin ingestion were studied on patients with Addisonian pernicious anemia and achlorhydria as compared with those able to secrete hydrochloric acid. Blood loss was measured by radiochromium technique and serum Vitamin B_{12} levels were also assayed. When aspirin (2.4 g/day) was admi stered orally four times daily for four days, increas ed amounts of blood were found in the feces of both control and experimental groups. In the anemic patients, blood loss rose from 0.36 ml/day to 2.26 ml/day while the control group showed an increase of 4. ml/day from a basal loss of 0.53 ml/day. Hydrochlor acid therefore appears to be unrelated to the occurrence of bleeding following aspirin administration.

6615 ENDOGENOUS HISTAMINE AND PROMETHAZINE-INDUCED ULCERS IN THE GUINEA-PIG. *(Fr.)*

Djahanguiri, B. (Fac. Med. U. Teheran, Iran) and M. Hemmati. *Therapie* 25(3):611-614, 1970.

The effects of a diamine oxidase inhibitor, aminoguanidine, and of a histidine decarboxylase inhibito NSD 1055, on promethazine ulcer-induction was studie in guinea pigs to determine if correlations existed between histamine liberation by promethazine and ulcer induction. NSD 1055 (150 mg/kg) and prometha (87.5 mg/kg) or aminoguanidine (10 mg/kg) and promethazine or promethazine alone was administered i.p. to 3 groups of 20 animals after 24 hr fasting and 10 animals received saline. The animals were sacrifice after 5 1/2 hr and the stomachs were examined microscopically for necrotic or hemorrhagic lesions. The percentage of ulcer induction for saline, NS 1055 and promethazine, aminoguanidine and promethazine, and promethazine alone was 0, 15, 90 and 50%, resp. Promethazine ulcer-induction thus seems to be relate to its histamine liberating effects.

STOMACH AND DUODENUM

Peptic Ulcers

657 · LIVER STUDIES IN PATIENTS WITH PEPTIC ULCER BEFORE AND FOLLOWING SURGERY. *(E.)* Ward, . (Bispebjerg Hosp., Copenhagen, Denmark), T. S. lsen and N. Tygstrup. *Scand J Gastroent* (supp. 7):137-142, 1970.

n 44 patients (32 male, 12 female; average age 57 ears) with peptic ulcer, hospitalized for surgical reatment of gastric or duodenal ulcer, liver tests bilirubin, transaminase, alkaline phosphatases, sulfo- romophthalein retention and unspecific choline sterase) and liver biopsy were studied 1 to 4 days rior to operation. The sulfobromophthalein retention est was most frequently abnormal (21 patients), ollowed by choline esterase, aspartate transaminase nd alkaline phosphatases, and only 1 patient had a lightly raised serum bilirubin. The liver biopsies howed only minute alterations, the most frequent eing bile plugs (more among female than among male atients) and pigment granules, and, to a lesser egree, slight fatty infiltration. No marked association between clinical data, liver tests and histologic ppearance was found. The liver tests became signifi- antly more abnormal 4 and 8 days after surgery, but gain could not be related to the clinical data or the urgical procedure. These alterations appeared to e transitory.

658 A CONTROLLED STUDY ON THE USE OF PROPANTHELINE AND AMYLOPECTIN SULFATE (SN-263) FOR RECURREN- ES IN DUODENAL ULCER. *(E.)* Sun, D. C. H. (VA Hosp. hoenix, Ariz.) and M. L. Ryan. *Gastroenterology* 8(6):756-761, 1970.

ffect of long term administration of an antipeptic gent, SN-263, (amylopectin sulfate) an anticholin- rgic drug, propantheline bromide, and combinations f the 2, were investigated in chronic ulcer patients n a double blind study. On long term placebo therapy, 2 of 16 patients showed a recurrence of ulcer disease 75% incidence). In the propantheline group (15 mg times a day), 7 out of 18 patients developed recur- ence of ulcer during the follow-up period of 1 year, n incidence of 39%. The SN-263 group (250 mg every hr during the waking period) had a low incidence of ulcer recurrence, 3 out of 19 patients or 16%, while the combined propantheline and SN-263 group had the lowest recurrence rate of 2 out of 17 or 12%. The only side effect observed in 1 or 2 patients of each group was a minimal dryness of the mouth.

6659 THE EFFECT OF RESTRAINT AND SOME ULCEROGENIC AGENTS ON THE SULFATION AND TURNOVER RATES OF GASTROINTESTINAL POLYSACCHARIDES. *(E.)* Terho, T. (Dept. Physiol., U. Turku, Finland) and K. Hartiala. *Scand J Gastroent* 5(3):197-205, 1970.

The effects of ulcerogenic agents (cinchophen and salicylic acid) and restraint on the sulfation and turnover rates of gastrointestinal polysaccharides (isolated by cetylpyridinium chloride precipitation and magnesium chloride solubilization) were studied in female rats. Chronic doses (0.33 mM/rat/day p.o.) of the ulcerogenic agents over a 10 day period and acute doses (1 mM/rat) of the agents produced no significant changes in the sulfation capacity of the gastrointestinal tract (except that chronic cinchophen activated sulfation). When the animals were subjected to restraint at 23°C for 24 hr, no ulcers were found in the glandular stomach, duodenum, or small intestine, and sulfation activity (cpm/μg hexosamine) increased slightly (395 to 715, 261 to 365, and 304 to 462, resp.); but when the same experiment was repeated at 20°C, ulcers developed to varying degrees and sulfation showed decreases in the glandular stomach (462 to 218), duodenum (268 to 235), small intestine (448 to 284), kidney (830 to 596), cartilage (105 to 36), and skin (128 to 69). Restrained rats (given 0.5 mC $Na^{35}SO_4$/100 g) with high ulcer frequencies had specific activities similar to those in controls indicating that turnover rates of sulfopolysaccharides did not change during restraint. Inhibition of sulfation during ulcerogenesis apparently is a result rather than a cause of ulcerogenesis.

SMALL INTESTINE

6671 RELATIONSHIP OF THE ENTEROHEPATIC CYCLE TO ULCEROGENESIS IN THE RAT SMALL BOWEL WITH FLUFENAMIC ACID. *(E.)* Wax, J. (Parke, Davis Co., Ann Arbor, Michigan), W.A. Clinger, P. Varner, P. Bass and C.V. Winder. *Gastroenterology* 58(6):772-780, 1970.

The relationship of the enterohepatic cycle to ulcerogenesis in the small intestine was studied in rats treated with flufenamic acid, using surgical interruption of the common bile duct and chemical alteration of enterohepatic circulation with either cholystyramine or paromomycin. The single dose, i.m. or p.o., 24 hr ulcerogenic ED_{50} of flufenamic acid in fasted rats ranged from 22-51 mg/kg. A high incidence of ulcerogenesis was present in intact animals 16 hr after flufenamic acid administration while animals with ligated bile ducts were totally protected. There were no ulcerations in any ligat animals, although plasma levels in those receiving second dose of drug were significantly elevated. Ulcerogenesis at 24 hr was significantly inhibited pretreatment with 400 mg/kg of cholestyramine (70 t 80%). Plasma levels of flufenamic acid in animals pretreated with cholestyramine were significantly less than those treated with water. In animals pr treated with paromomycin, ulcerogenesis was preven or significantly depressed. The paromomycin experi ments strongly suggest that the mere presence per of all of the untrapped bile-drug constituents in lumen is insufficient to precipitate ulceration. U less antibiotics interfere importantly with bile secretion, other mechanisms could include transmuc sal absorption of one or more of bile-drug constit ents, their deconjugation by microbial enzymes, an or drug-facilitated microbial injury of mucosa.

6672 THE EFFECT OF STAPHYLOCOCCAL ENTEROTOXIN ON THE EPITHELIAL MUCOSUBSTANCES OF THE SMALL INTESTINE OF RHESUS MONKEYS. *(E.)* Sheahan, D. G. (Walter Reed Army Med. Ctr., Washington, D.C.), H. R. Jervis, A. Takeuchi and H. Sprinz. *Amer J Path* 60(1):1-18, 1970.

The effect of staphylococcal enterotoxin on epithelial mucins of the small intestine was studied histochemically in rhesus monkeys. The most significant observations noted were discharge with subsequent repletion of goblet cell mucin, and a reversible reduction in number, size and basophilia of apical granules of crypt epithelium. Changes in mucosubstances appeared in the jejunum as early as 1 hr after ingestion of enterotoxin and was most marked between 2 and 8 hr. Mucosubstances reverted to normal between 8 to 12 hr and at 72 hr after enterotoxin administration, they are indistinguishable from controls. Similar changes appeared later but were less pronounced in the upper and lower ileum. Although the neutral, PAS-positive, mucosubstances in crypt granules appeared to be reduced during the first 6 hr after administration of enterotoxin, they did not disappear, whereas there was almost complete depletion of sulfated mucosubstances. There was an increased number and size of crypt granules and crypt and goblet cells with positive PAS staining and subsequent increased basophilia during recovery (12 to 24 hr). Sulfomucins on the luminal aspect of the striated border appear to be synthesized in the crypt cells and purified staphylococcal enterotoxin apparently influences metabolism and/or secretion of intestinal mucins.

SMALL INTESTINE

Malabsorption

6683 INTESTINAL VILLOUS ATROPHY AND MALABSORPTION. *(Fr.)* Laumonier, R. (Hosp. Charles Nicolle, Rouen, France), J. Metayer and C. Marche. *Presse Med* 78(24):1095-1098, 1970.

Villous atrophy was studied on 87 jejunal biopsies (initial portion) from maldigestion and malabsorption affected patients and on 10 normal samples. Four degrees of atrophy were defined (from 2nd to 5th degree, the first degree corresponding to normal). In 50% of the impaired digestion cases a 2nd degree atrophy (mucosal and secretory changes of the villous epithelium, diminution of the enterocytes) or a 3rd degree atrophy (blunting and shortening of villi) was found. Celiac disease determined the most severe atrophies of the 4th degree (the villi were shorter than the crypts which were deeper than usual and the villous epithelium assumed a vacuolated aspect), and the 5th degree (obliteration of villi and flattening of mucosa). No precise relationship between clinical and histological findings could be established but severe atrophy appears not to be specific and may occur in secondary malabsorption as well. The various degrees of villous atrophy seem to indicate the progress of a single process in which the primary lesion induces an inability for villous epithelium renewal.

6684 CONGENITAL MALABSORPTION OF FOLATE. *(E.)*

Lanzowsky, P. (Long Island Jewish Med. Ctr., New Hyde Park, New York). *Amer J Med* 48(5)580-583, 1970.

Two siblings and a 20-year old girl have been reported by 2 groups of investigators as having congenital isolated defects of gastrointestinal absorption of folic acid and defect of folic acid transport into cerebrospinal fluid; results included recurrent megaloblastic anemia, mental retardation, convulsions and a neurologic movement disorder. Ataxia was observed in 2 siblings, while athetotic movements were observed in the 20-year old girl. This patient demonstrated a special defect of absorption of folic acid in its naturally occurring form as pteroylpolyglutamic acid as well as pteroylmonoglutamic, pteroyldiglutamic, pteroyltriglutamic acids, N^5-formyl- and N^5-methyltetrahydrofolic acids and an inability normally to transfer folic acid from blood into the cerebrospinal fluid. Absorption was not enhanced in the presence of normal human duodenal juice, lyophilized calf jejunum or lyophilized calf pancreas. The patient described herein could be maintained for years clinically and hematologically normal on an oral regimen of 40 mg of folic acid daily, but is unable to absorb small physiologic quantities of the vitamin. There is evidence that folate undergoes a metabolic change during transport across the gut. The precise defect in folate transport has not been elucidated in these patients.

6685 ^{47}Ca STUDIES IN ADULT CELIAC DISEASE AND OTHER GASTROINTESTINAL CONDITIONS WITH PARTICULAR REFERENCE TO OSTEOMALACIA. *(E.)*

Harris, O. D. (Gen. Hosp., Birmingham, England), H. M. Philip, W. T. Cooke and W. F. R. Pover. *Scand J Gastroent* 5(3):169-175, 1970.

Measurements of plasma levels and 6-day retention of isotope following oral administration of ^{47}Ca were undertaken in 31 patients (17 with adult celiac disease, 14 with other gastrointestinal disorders) to determine its value in detection of osteomalacia. Correlation of 60 and 120 min plasma levels with 6-day whole body counts of the heterogeneous group of subjects was .271 and .719 resp., but at any given plasma result, percentage retention ranged between 40-70%; this factor precluded use of this method as a measure of calcium absorption. Mean 60 and 120-min plasma levels of ^{47}Ca were lower than controls in all groups but were significantly lower in osteomalacic celiacs and patients with normal bones. Mean plasma levels of 5 patients with celiac disease receiving calciferol were 3.18 and 4.68 mg/100 ml at 60 and 120 min, resp., while 6-day retention averaged 68.7 mg/100 ml (range 51.6-81.1). Retention tests before and after p.o. calciferol therapy (1.25 mg daily for 2 to 4 months) were completed in 5 patients and 1 normal subject. Increase in ^{47}Ca in osteomalacic patients ranged from 2.4-39.5% retention (16.8% mean increase) while in the normal subject it increased from 52.6-59.6%. The effect of calciferol and the lack of correlation between retention level and bone histology suggests that calcium absorption is not an important or primary factor in the production of osteomalacia associated with gastrointestinal diseases. Neither ^{47}Ca plasma levels nor retention of ^{47}Ca helped the diagnosis of osteomalacia.

6686 THE COLUMNAR CELLS IN MALABSORPTION SYNDROMES. *(Fr.)*

Laumonier, R. (Hosp. Charles Nicolle, Rouen, France), C. Marche and J. Metayer. *Presse Med* 78(24):1089-1094, 1970.

Jejunal biopsies (initial portion) obtained by Debray's technique from patients affected by a-β-lipoproteinemia, celiac disease, a-γ-globulinemia, Whipple's disease and Pick's syndrome were studied by light and electron microscopy. Intracellular membrane system alterations and microvillous distortions (producing a reduction in exchange processes due to the decrease of cell surface and transport enzymes) were common to all malabsorption syndromes. A-β-lipoproteinemia was characterized by villous irregularities and bright columnar cells loaded with membrane lacking fatty droplets which might be due to a deficiency in chylomicron formation by lack of lipoproteins. Celiac disease produced villous atrophy and arrest of cellular functional maturation while all enzyme activities except alkaline phosphatase were reduced; the intracellular system was normal. A-γ-globulinemia led to a flattening of mucosa, (due to a 3rd degree villous atrophy) and a delay in fatty absorption occurring otherwise regularly. Whipple's disease revealed typical cells with intense lysosoma activity due to bacterial bodies. Pick's syndrome revealed intercellular alterations disturbing the normal circulation of metabolites. Electron microscopy and cytochemistry provided information related to physiopathology rather than to diagnosis.

LARGE INTESTINE

93 ISCHEMIC COLITIS. *(E.)* Balslev, I. (Inst. Path., Copenhagen, Denmark), H. E. Jensen, Norgaard and P. Poll. *Acta Chir Scand* 6(3):235-242, 1970.

ree case histories and relevant literature are used review the etiology, symptoms, X-ray changes, thology, differential diagnosis, and the treatment ischemic colitis. The cause of the disorder is reduction or cessation of arterial blood flow to segment of the colon, followed by infarction of rying extent. Two patients described here had clusions of the middle colic artery and presented mptoms such as acute onset of abdominal pain, often companied by nausea, vomiting, melena or passage fresh blood, mild fever and debility. X-ray amination in acute partial occlusion showed a broad-sed defect of the contour of the colon wall, finger- size, or a larger so-called "thumbprint" was served. With more extensive changes, the lumen peared to be stenosed over longer or shorter stretches to large, pad-shaped thickenings in the intestinal ll. The most essential differential findings of chemic colitis are macroscopically demonstrable crophages containing hemosiderin and atherosclerotic ssels with narrow lumina; these changes are frequent with Crohn's Disease and ulcerative itis.

94 SKIN-REACTIVE SOLUBLE ANTIGEN FROM INTESTINAL CANCER-CELL-MEMBRANES AND RELATIONSHIP CARCINOEMBRYONIC ANTIGENS. *(E.)* Hollinshead, A. eorge Washington U. Med. Ctr., Washington, D.C.), Glew, B. Bunnag, P. Gold and R. Herberman. *cet* 1(7658):1191-1195, 1970.

Skin tests were performed in 19 patients with carcinoma of rectum and colon in order to detect cellular-immunity (delayed-hypersensitivity) reactions to tumor antigens (from membranes of autologous tumor cells). Seventeen of these patients showed positive delayed reactions to soluble fractions. Two patients gave equivocal or negative reactions; no patients gave persistent positive reactions to control fractions. Biopsies of positive skin reactions showed histological reactions compatible with delayed hypersensitivity reactions. Skin-reaction antigens were also positive in 2 patients (already positive to tumor membranes) receiving digestive tract cells of the first-trimester and second-trimester fetuses. Fetal membranes from third-trimester fetuses were tested in one fetus, but gave a negative response. Carcinoembryonic antigen (C.E.A.) was detected in many of the fractions producing positive skin reactions. Fetal-cell-membrane antigens seem to be related in some manner to tumor-specific transplantation antigens being studied in adult tumor cells, and are also closely related in antigenic structure to those antigens (C.E.A.) detectable in sera of patients with intestinal cancer. C.E.A. and tumor-specific transplantation antigens may be two separate components.

LARGE INTESTINE

Ulcerative Colitis

30 EFFECTS OF PRELIMINARY INCUBATION OF LYMPHOCYTES WITH SERUM ON THEIR CYTO-XICITY FOR COLONIC EPITHELIAL CELLS. *(E.)* orter, R. G. (Mayo Clin., Rochester, Minn.), A. Huizenga, S. G. ReMine and R. J. Spencer. *stroenterology* 58(6):843-850, 1970.

periments were carried out to assess the effects preliminary incubation of normal lymphocytes) subjects) or lymphocytes from 5 subjects with tive chronic ulcerative colitis or granulomatous litis with their own sera, pooled normal human rum, or sera from other patients, including sera tained 10 days following colectomy, on their cyto-xicity for human colonic epithelial cells *in vitro*. eliminary treatment for 4 days of lymphocytes from normal subjects with sera from patients with ulcerative or granulomatous colitis led to their demonstration of cytotoxic properties for colonic epithelium, but this was not found if 10-day post-operative ulcerative colitis sera, fetal calf serum, pooled normal human serum, or sera from patients with other diseases were used. Cytotoxicity of lymphocytes from patients with ulcerative or granulomatous colitis for colonic cells *in vitro* was decreased markedly (mean survival for initial test, 73% vs 92% after retesting 4 days later) by pre-treatment with sera from other patients with these diseases. Similar pretreatment of lymphocytes from other colitis patients with their own serum, fetal calf serum, or pooled normal human sera did not decrease the cytotoxicity for colonic epithelial cells.

6731 CELL RENEWAL IN THE HUMAN RECTUM: *IN VITRO* AUTORADIOGRAPHIC STUDY ON ACTIVE ULCERATIVE COLITIS. *(E.)* Bleiberg, H. (U. Hosp. St. Pierre, Brussels, Belgium), P. Mainguet, P. Galand, J. Chretien and N. Dupont-Mairesse. *Gastroenterology* 58(6):851-855, 1970.

Generation time and cell renewal in human rectal mucosa was studied in normal subjects and in patients with ulcerative colitis. A double labeling technique with two pulses of ^{3}H-thymidine, followed by autoradiography, was applied to biopsies incubated *in vitro*. No significant difference occurred for S-phase duration (deoxyribonucleic acid synthesis phase) in normal and pathological tissues. Mean turnover time in ulcerative colitis was significantly shorter (34 hr) than in normal tissues (90 hr). Extension of the proliferative zone (which is usually limited to the lower parts of the crypts in normal rectal mucosa) toward the upper part of the crypt was observed in ulcerative colitis. In ulcerative colitis, morphological evolution of rectal mucosa toward atrophy, which expresses a change of normal equilibrium between cell loss and cell production, seems to be explained by increased rate of cell destruction rather than by decreased rate of cell formation.

6732 THE SMALL-INTESTINAL FUNCTION IN ULCERATIVE COLITIS. *(E.)* Kasper, H. (Sch. Med., Justus Leibig U., Giessen, Germany) and H. A. Kuhn. *Amer J Proctol* 21(4):253-257, 1970.

The effect of ulcerative colitis on the absorption and morphology of the villi of the small intestine was studied in 20 patients using lactose and vitamin A tolerance tests, the D-xylose test, and microscopic and histological examinations of the mucosa. A pathologic lactose test, D-xylose test, and vitamin A test was found in one, three and two cases, resp. Microscopic examination of jejunal mucosa in 5 patients did not reveal changes of the villi in the sense of partial or subtotal villous atrophy. On the contrary, especially leaf-shaped villi were found in all patients and histological examination did not reveal pathological changes. Small intestinal involvement seems to occur only during the acute phase of ulcerative colitis and then improves rather quickly.

lysis is made of histological findings in the
cular and ductal systems in pancreatic lesions
radiography performed on blood vessels and ducts
human pancreases taken at autopsy. The pancreas
seen to receive its blood supply from 8 tributar-
of the common hepatic, splenic and superior
enteric arteries. Blood to the body and tail
supplied from splenic artery tributaries while
head received its supply from pancreaticoduodenal
ery branches. The main pancreatic duct in the
d was located along the center of the pancreas;
ondary ducts through intralobular tissue were
nly distributed in radial form. In biliary tract
ease, diffuse lesions and necrosis were commonly
ed whereas fatty necrosis was abundant with
atic disease. In 8 cases of renal pathology,
lular infiltration, acinar dilation and fatty
lacement was found in high incidence. Edema
m all lesions was slightly more common in head
body, cellular infiltration appeared with lower
quency in the tail, whereas no regional differences in fat necrosis were evidenced. Fibrosis appeared in highest frequency in the head and body. Ductal and vascular factors probably interact in the etiology of pancreatitis.

LIVER AND BILIARY TRACT

6761 GLUCOSE-6-PHOSPHATASE AND ALDOLASE IN RAT LIVER TUMORS INDUCED BY DIETHYLNITROSAMINE. *(Ger.)* Hadjiolov, D. (Oncol. Res. Inst., Sofia, Bulgaria) and A. Dikow. *Z Krebsforsch* 74(1):48-54, 1970.

In diethylnitrosamine-induced liver carcinomas in male albino rats, glucose-6-phosphatase activities were half that of normal liver tissue levels (6.6 mg P/hr at 37°C vs 13.2 mg P/hr). Tumor cells which did not undergo necrobiotic processes revealed high glucose-6-phosphatase activity levels histochemically while no enzyme activity was found in necrobiogically degenerated cells, which explains the lower levels found in tumor homogenates. Aldolase activity on fructose-1,6-diphosphate and fructose-1-monophosphate showed a complete preservation of enzyme activity in tumor cells [0.85 μmole FDP/mg protein/min at 37°C vs 0.81 and 0.54 μmole FMP/mg protein/min at 37°C vs 0.61]. The ratio between the activities on the two substrates varied in each tumor and was comparable to that of normal liver tissue [FDP/FMP 1.8 to 3.6 vs 1.3]. Three cathodic fractions were found in the isoenzyme pattern of aldolase with fructose-1,6-diphosphate as its substrate, while only two fractions were found for normal liver tissue. The anodic part of the isoenzymogram
revealed 4 fractions which were much more inten
than in normal tissue. No differences were fou
in isoenzymograms of normal and tumor tissue us
fructose-1-monophosphate as a substrate.

6762 SERUM LIPOPROTEINS OF RATS BEARING TR
PLANTED MORRIS HEPATOMA 7777. *(E.)* N
K. A. (Burnsides Res. Lab., U. Illinois, Urbana
H. P. Morris. *Int J Cancer* 5(3):410-414, 1970.

Serum lipoprotein patterns of Buffalo-strain ra
bearing a transplanted Morris hepatoma 7777 wer
determined in the 2nd, 4th, and 5th weeks after
transplantation. The presence of a slow-moving
density lipoprotein component was seen, which w
similar to that observed previously in Holtzman
given 0.03% N-2-fluorenylacetamide (a carcinoge
agent). Ultracentrifugation, chemical analysis
disc electrophoresis confirmed the increase in
lipoproteins, especially the high density lipop
HDL_2, (control 103; treatment 267 mg/100 ml se
in these tumor bearing rats. The serum total
cholesterol and phospholipid were considerably
increased at 4 weeks after transplantation (co

, 73, 78 mg/100 ml serum; treatment 360, 141, 114 100 ml serum, resp.) while the total serum pro- ns were only slightly elevated (control 5568; atment 6240 mg/100 ml serum) in rats with tumors compared to control rats. A new α_1-globulin com- ent was observed in the serum protein patterns the tumor bearing rats.

63 EFFECTS OF HEPATIC ISCHEMIA ON COAGULATION IN PRIMATES. APPLICATION TO LIVER NSPLANTATION. *(E.)*

Dinbar, A. (U. California Angeles, Sch. Med.), D. M. Rangel and E. W. kalsrud. *Surgery* 68(1):269-276, 1970.

atologic studies were made on vena caval blood ples obtained from 5 stump-tail monkeys in which hepatic artery and portal vein were occluded one k after side-to-side portacaval shunting was per- med, in order to determine the effect of hepatic hemia on coagulation. Values obtained after portacal shunting were used as controls and compared to ues obtained following complete hepatic ischemia. lobulin lysis times decreased approximately 33% oth groups, and returned to normal (3 hr follow- hepatic ischemia, 2.3 hr following portacaval ting) within 2 hr, and increased 2-3 times above al after 4 hr followed by a gradual return to al. Thrombin times increased rapidly to aproxi- ly twice the normal value (32 sec for hepatic hemia, 36 sec for portacaval shunting) immedi- ly after both operative procedures, and then de- ed gradually, remaining high however, throughout entire experiment. The platelet counts did not significant changes after portacaval anasto- s, whereas in hepatic ischemia there was an diate decline upon revascularization which con- ed progressively for 4 hr to 63% of the initial es. Acid phosphatase and serum glutamic pyruvic saminase did not increase during the first hour owing the operative procedures, but thereafter blood levels of both of these enzymes increased ificantly in portacaval shunting procedures. scularization of the ischemic livers demonstrated mprovement in the euglobulin lysis times as did thrombin times. There was a 10% drop in the elet count but there were no changes in cellular mes following revascularization. It was sug- ed that, although fibrinolytic activity was in- d by both operative procedures, the consumption ulopathy, presumably due to intravascular clot- , was intensified by the revascularization of ischemic liver, possibly because of clotting in the liver itself.

7 DIMINISHED MICELLAR PHASE LIPID IN PATIENTS WITH CHRONIC NONALCOHOLIC LIVER DISEASE AND TORRHEA. *(E.)*

Badley, B. W. D. (Roy. Free Hosp., on, England), G. M. Murphy, I. A. D. Bouchier S. Sherlock. *Gastroenterology* 58(6):781-789, 9.

mechanism of steatorrhea (a common feature of nic liver disease) was studied in 15 nonalcoholic ents (3 normal controls, 12 with chronic liver ase, 9 of whom had steatorrhea) to determine if disorder was associated with impairment of micellar solubilization of dietary fat. Following analysis of four 1/2 hr samples from most subjects, ranges, mean values and standard deviations of total lipid content were as follows: normal controls, 4.7 ± 4.3 mg/ml; patient controls, 4.9 ± 2.8 mg/ml; steatorrhea group, 7.9 ± 7.1 mg/ml. The fatty acid to total lipid ratio was the same in steatorrhea and control groups; normal controls, 49.5 ± 18.4%; patient controls, 47.6 ± 23.8%; steatorrhea group, 45.7 ± 20.9%. The steatorrhea group incorporated significantly less total lipid into micellar phase (14.7 ± 12.9%) than controls (normal controls, 55.2 ± 19.6% and patient controls, 62.4 ± 27.3%). Total bile salt concentrations ranged from 3.3 to 30 mM in normal controls and from 4.1 to 16.5 mM in patient controls. In contrast, most values in steatorrhea group were < 4 mM, significantly lower than both controls. Lowest values of pigment concentration were obtained in patients with steatorrhea; patients had histological and biochemical evidence of intrahepatic biliary obstruction. Results indicate that in patients with chronic liver disease steatorrhea is associated with subnormal intraluminal concentrations of conjugated bile salts and impaired micellar lipid concentration. It is suggested that steatorrhea in nonalcoholic patients is most likely due to inability of subnormal concentrations of bile salts to fulfill their normal role in fat absorption.

6765 ULTRASTRUCTURAL CYTOCHEMISTRY OF NUCLEAR PORES IN NOVIKOFF HEPATOMA CELLS. *(E.)*

Koshiba, K. (Baylor Coll. Med., Houston, Tex.), K. Smetana and H. Busch. *Exp Cell Res* 60(2):199-209, 1970.

The ultrastructure of the Novikoff hepatoma ascites cells from transplants grown in male rats was studied, after digestion with protease as well as nucleases to provide more insight into the cytochemistry of the fine filaments present within the nuclear pores. The Novikoff hepatoma cell demonstrated great variability in sensitivity to proteases (pepsin, subtilisin, and pronase) as well as nuclease (ribo- and deoxyribo-) and some cells were resistant to these enzymes even after relatively prolonged digestion (90 min). The fine filaments (12 to 25Å wide) present within the nuclear pores of control specimens were partially removed in 45% of the cells and completely removed in 10% of the cells following subtilisin digestion for 90 min. In contrast, the filaments were resistant to the treatment with ribonuclease on deoxyribonuclease and seemed to represent protein structures. In cells that were sensitive to ribonuclease, although the fine filaments remained intact, the ribosomes were digested.

6766 SERUM IMMUNOSUPPRESSIVE ACTIVITY DUE TO AZOTHIOPRINE AND ITS RELATION TO HEPATIC FUNCTION AFTER LIVER TRANSPLANTATION. *(E.)*

Mitchell, C. G. (King's Coll. Hosp. Med. Sch., London, England), A. L. W. F. Eddleston, M. G. M. Smith and R. Williams. *Lancet* 1(7658):1196-1199, 1970.

Serum immunosuppressive activity due to azathioprine was measured in 5 patients after liver transplantation, using a technique based on the inhibition of spontaneous rosette formation *in vitro*. Normal titre of immunosuppressive activity was defined as the lowest dilution of serum which prevented more than 25% of the rosette formation. Levels similar to those in controls were found when the plasma-bilirubin was normal, whereas in 3 patients with various degrees of cholestasis, levels were moderately reduced (1/64, 1/64, and 1/128). Serial measurements in one, showed a close correlation in time between the fall in serum immunosuppressive activity and the development of jaundice. In another patient with severe hepatocellular damage, there was no rise in serum immunosuppressive activity after oral azathioprine. The above findings should be considered when treating liver transplant rejection and controlling autoimmune liver disease with azathioprine.

6767 BIOCHEMICAL INVESTIGATIONS IN TWO PATIENTS AFTER HOMOTRANSPLANTATION OF THE LIVER.

(Ger.) Breuer, J. (Surg. U. Clin. Polyclin., Bonn, Germany), T. S. Lie and H. Breuer. *Z Klin Chem* 8(3):249-253, 1970.

Liver transplant was performed in two male patients (30 and 50 years old) with primary malignant neoplasms. Liver function was resumed immediately following transplant in both patients. The first rejection crisis in the 30 year old patient revealed itself through a high increase in serum transaminases, lactate and glutamate dehydrogenases as well as through a slow decrease in cholinesterase activity. Bile duct obstruction induced an increase in alkaline phosphatase activity which decreased after the removal of obstruction. Total serum bilirubin levels became normal between the 40th and 80th day after transplant. Enzyme activity levels assumed a constant pattern, except for alkaline phosphatase (which was still high) and the patient was released in general good condition. An increase of total bilirubin level, transaminase and alkaline phosphatase activities occurred later as the increasing decay of liver function was manifested by a steady decrease of cholinesterase activity and a striking increase of the other enzyme activities. Total disruption of liver function through parenchymal deficiency occurred with a decrease of transaminase activities, a lowering of alkaline phosphatase to "normal" values as well as an increase in total bilirubin and of mitochondrial glutamate dehydrogenase activity. These changes were accompanied by comatous status and led to death 206 days after the transplant. The 50 year old patient died on the 6th day after transplant. A histological examination of the transplanted organ revealed a beginning of rejection with no signs of parenchymal damage.

6768 INFLUENCE OF ETHANOL AND MICROSOMAL DRUGS ON HEPATIC HEMODYNAMICS. *(E.)*

Leevy, C. M. (New Jersey Coll. Med. Dent., Newark, N.J.), W. tenHove, A. Opper and S. Popovic. *Ann NY Acad Sci* 170(1):315-331, 1970.

The influence of ethanol, oxandralone and phenobarbitol on hepatic hemodynamics and liver microsomal structure and function was studied in hospitalized patients with diagnoses of alcoholic liver disease, or viral hepatitis. Six alcoholics with normal liver and 7 with inactive cirrhosis received 0.5 to 1.5 g/k of ethanol to determine the acute effect of alcohol on hemodynamics. Oxandrolone (120 mg/day) was given for 12 days to 12 patients with normal liver, 18 with fatty liver, 11 with steatonecrosis and 20 with cirrhosis. Phenobarbital (30 mg q.i.d.) was given for 12 days to 5 patients with normal liver, to 15 patients with fatty metamorphosis and to 7 patients with cirrhosis. There was no significant difference between transhepatic pressure, hepatic blood flow and oxygen consumption in ethanol-treated patients with normal livers other than the incidence of subcellular changes of swollen mitochondria and hyperplastic endoplasmic reticulum. In patients with severe fatty liver and without mesenchymal-sinusoidal cell proliferation there was a significant reduction of transhepatic pressure, an increase in blood flow and a decrease in oxygen consumption following mobilization of fat. In these patients the incidence of esophageal varix hemorrhage was associated with local mucosal erosion. Oxandrolone accelerated repair of alcoholic liver damage and improved hepatic circulation in alcoholics with steatonecrosis and induced a reduction in transhepati pressure, a 10% increase in hepatic venous O_2 content a 30% increase in hepatic blood flow and a 15% reduction in oxygen extraction. In patients with inact cirrhosis, oxandrolone therapy induced an increase in transhepatic pressure and resulted in a 20% reductio of hepatic blood flow, a 15% reduction in hepatic ven O_2 content and a 20% increase in hepatic vascular resistance. Repeated therapy with oxandrolone in patie with inactive cirrhosis induced to pronounced hyperplasia of the endoplasmic reticulum, liver cell damag elevated intrasinusoidal pressure and increased porta hypertension. Phenobarbital had no significant effe on hemodynamic disturbances in livers of alcoholics steatonecrosis but phenobarbital produced a marked h plasia of the endoplasmic reticulum and may induce bleeding from esophageal varices due to increased po wedged pressure in patients with inactive cirrhosis.

6769 CARCINOGENICITY OF STERIGMATOCYSTIN. *(E.)*

Purchase, I. F. H. (South African Med. Res Council, Pretoria) and J. J. Van Der Watt. *Food Cosmet Toxic* 8(3):289-295, 1970.

Weanling rats divided into 8 groups (2 controls) of 5 males and 5 females each were given sterigmatocyst in the diet (three groups, .15, .3 or 1.5 mg each fo 6 months, resp., and .22, .45 or 220 mg each for the following 6 months) or by stomach tube (three groups 0.15, 0.3 or 1.5 mg/day 5 days/week for 52 weeks). Death occurred between the 5th and 18th week in 8 rats given 1.5 to 2.25 mg/day of sterigmatocystin, while 39 of the 50 treated rats surviving to the 42n week eventually developed hepatocellular carcinoma. Of these 31 had varying degrees of fibrosis. Eight tumors of other types were seen in various organs id acanthotic changes occurred in the stomachs of 5% of the treated rats. The lesions produced in ne livers of rats exposed to sterigmatocystin were imilar to those found in Bantu hepatoma and "toxic" epatitis, indicating that the high incidence of iver cancer in Africa may be related to the ingestion mycotoxins.

70 THE BINDING CAPACITY OF HUMAN ALBUMIN FOR BILIRUBIN AND ITS SIGNIFICANCE IN THE THOGENESIS OF KERNICTERUS. *(E.)* Bratlid, D. (Govt. sp., Oslo, Norway) and J. Fog. *Scand J Clin Lab vest* 25(3):257-261, 1970.

e binding relationships of human albumin with bilibin were studied by means of absorption spectrootometry and Sephadex gel filtration. The absorpon curves of bilirubin at pH 8.3 revealed a disacement toward shorter wavelengths (at 420 nm) at lirubin/albumin ratios exceeding 1. Absorption rves at pH 7.4 revealed no displacement toward orter wavelengths at 1/1 molar bilirubin/albumin tio. The absorbance differences at 470 nm at this lar ratio indicated the presence of a second molele of bilirubin bound to albumin. Use of Sephadex-25 filtration showed no changes in the bilirubin/ umin ratio at different pH levels and the prece of only one molecule of albumin bound to each lirubin molecule, although a second molecule of irubin appears to be partially retained on the umn suggesting that a dimerization may occur. relative ease of dissociation of the dimer may lain the development of kernicterus at a molear bilirubin/albumin ratio in the serum of above 1.

1 ELECTRON MICROSCOPIC STUDY OF THE LIVER IN SO-CALLED IDIOPATHIC JAUNDICE OF LATE GNANCY: OBSERVATIONS IS SIX CASES. *(E.)* Van lst, U. (Dept. Path., U. Nimegen, Netherlands) N. Bergstein. *Path Europ* 5(2):198-215, 1970.

electron microscopic study of liver biopsies was ducted in 6 women with so-called idiopathic jaune in late pregnancy. Five of 6 patients showed eralized severe pruritus and jaundice accompanied lassitude or malaise without fever during the last mester of pregnancy. Only one case of pruritus not accompanied by jaundice and hepatosplenoaly or gastrointestinal complaints were absent. almost all cases, levels of serum alkaline phostase, total and conjugated serum bilirubin, choterol and β-globulin fraction were elevated and re was a delayed sulfobromophtalein excretion. nt microscopy, in 3 patients, revealed cholestasis le plugs) in centrolobular canaliculi and small, al accumulations of bile pigment in some liver ls around bile canaliculi. With electron microoy, there were many dilated bile canaliculi, with s and/or distortion of their microvilli and which tained biliary material. Other observations luded a well developed smooth endoplasmic reticum, hypertrophy of Golgi complexes, intracytoplasmic mulation of biliary constituents, intramitodrial fibrillar inclusions, widening and condenion of ectoplasm, and in 3 cases, many microbodies. Findings in liver cells bear no specific character and no definite conclusions can be drawn as to pathogenesis of this type of jaundice.

6772 BREAST MILK JAUNDICE: EFFECT OF $3\alpha,20\beta$-PREGNANEDIOL ON BILIRUBIN CONJUGATION BY HUMAN LIVER. *(E.)* Adlard, B. P. F. (Dept. Chem. Path., U. Leeds, England) and G. H. Lathe. *Arch Dis Child* 45(240):186-189, 1970.

The effect of $3\alpha,20\beta$-pregnanediol, estriol, and dihydroepiandosterone on bilirubin conjugation was examined in human liver tissue slices and human solubilized glucuronyl transferase and in the livers of Wistar rats, New Zealand rabbits, guinea pigs and mice. Bilirubin conjugation by liver slices was determined by the amount of direct-reacting bilirubin in incubation medium by a modification of the Lathe and Walker method. Neither $3\alpha,20\beta$-pregnanediol nor dihydroepiandosterone inhibited conjugation by human liver slices or by solubilized human liver microsomes. Estriol inhibited the normal rate of bilirubin conjugation in human liver slices from 21.4 to 12.2 μg/ g liver/hr. The responses of liver slices in the other species to the steroids were comparable to those in human liver slices, suggesting that $3\alpha,20\beta$-pregnanediol is not the inhibitor causing breast milk jaundice.

6773 CLINICAL AND EXPERIMENTAL EVALUATION OF URINARY HISTIDINE DERIVATIVES AS AN INDEX OF FOLIC ACID METABOLISM: III. CLINICAL OBSERVATION IN LIVER DISEASE. *(E.)* Ishihara, S. (Fac. Med., Kyoto U., Japan). *J Vitamin* 16(1):1-9, 1970.

Among 53 patients selected for this study of folic acid metabolism, 14 suffered from acute hepatitis, 12 from chronic hepatitis, 20 with liver cirrhosis and 7 with liver cancer. After a loading with 15 g of L-histidine, excessive urinary excretion of formiminoglutamic acid was observed in 58.5% and of urocanic acid in 52%, and the two combined derivatives in 64%, indicating a widespread deficiency in folic acid metabolism in such patients. To analyze the mechanism of excessive excretion of histidine derivatives, therapeutic trials with minimal daily doses of folic acid (0.1 mg), tetrahydrofolic acid (THF) (0.1 mg), and doses of vitamin B_{12} coenzyme (5,6-dimethylbenzimidazolylcobamide) and vitamin B_{12} were carried out in 5 randomly selected patients with chronic hepatitis and 2 patients with liver cirrhosis. A marked decline of the derivatives to the normal range was found in 4 of these 7 on the fifth day of the course with folic acid and one of 2 patients refractory to folic acid responded to THF. One case in which both folic acid and THF were ineffective responded to both vitamin B_{12} coenzyme and vitamin B_{12}. Inadequate dietary intake of folate seems to be of greatest importance in the development of folic acid deficiency in liver disease.

6774 CELLULAR AUTOPHAGY: GLYCOGEN SEGREGATION IN EARLY STAGES OF A PARTIAL LIVER ATROPHY. *(Ger.)* Pfeifer, U. (Path. Inst. U. Wurzburg, Germany). *Virchow Arch Zellpath* 5(3):242-253, 1970.

Partial liver atrophy was achieved by separation of the left part of the median lobe (10 to 15% of total liver weight) from the portal blood flow by ligation of the portal vein branch for the study of cellular autophagy. Adult male rats were operated on in the morning at the time of maximal liver glycogen content. A large amount of autophagic vacuoles containing cytoplasmic organelles and/or glycogen was found in the acinoperipheral liver cells 2 to 5 hr after surgery. Segregation of glycogen (a manifestation of enhanced cellular autophagy) depended on the high cell glycogen content at the moment of injury. Glycogen segregation was also observed within the tubular or vesicular formations. Accumulation of glycogen within vacuoles may be due to either an enhanced cellular autophagy or to an enzyme deficiency, blocking the hydrolytic breakdown of the physiologically produced glycogen (as in glycogenosis type II).

6775 LIVER AND LUNG TUMORS AFTER 3,3'-DICHLORO-4-4'-DIAMINODIPHENYLMETHANE IN RATS. *(Ger.)*

Grundmann, E. (Inst. Exp. Path., Bayer Co., Wuppertal, Germany) and D. Steinhoff. *Z Krebsforsch* 74(1):28-39, 1970.

Liver and lung tumors were induced in 25 male and 25 female 100-day-old rats by maintaining the animals on a low protein diet and the oral administration of 27 g/kg of 3,3'-dichloro-4,4'-diaminodiphenylmethane. The average survival time of the treated animals was about 550 test days while control animals survived about 730 test days. Among the test rats, 22 males and 18 females had multilocular hepatoma which were mainly solid tumors with an organoid structure, 2 of which had produced massive pulmonary metastases and 1 a solitary metastasis in the brain. Hepatocellular and cholangiolar adenocarcinomata also developed. Primary lung tumors present in 13 animals were partly of an alveolar cell type, partly of a squamous cell type, mainly carcinomata and in 10 cases pulmonary tumors occurred with hepatomata. Compared to 4,4'-diaminodiphenylmethane, the compound that is dichlorinated in the 3,3'-position is less toxic but an essentially more potent carcinogen.

6776 EPITHELIOID CELL GRANULOMAS IN LIVER BIOPSIES. *(E.)*

Iversen, K. (Commun. Hosp., Copenhagen, Denmark), P. Christoffersen and H. Poulsen. *Scand J Gastroent* 5(supp. 7):61-67, 1970.

Epithelioid cell granulomas and lipogranulomas were found in 21 patients with various diagnoses following investigation of consecutive material of 2813 liver biopsies. In biopsy material, 16 patients showed epithelioid cell granulomas, 3 had both epithelioid cell granulomas and lipogranulomas and 2 showed only lipogranulomas. A combination of epithelioid cell granulomas and normal parenchyma usually was indicative of sarcoidosis or tuberculosis. Of the 5 patients with histologically verified sarcoidosis, 1 was cured, 2 died, and 2 progressed. The presence of epithelioid cell granulomas of the liver during acute hepatitis or cirrhosis is uncommon; no clues regarding prognosis are indicated. The best histological differentiation between epithelioid cell granulomas and lipogranulomas is the presence of fat vacuoles in lipogranulomas.

6777 STUDIES ON MYOINOSITOL: V. EFFECT OF MYOINOSITOL ON THE PREVENTION OF FATTY LIVER INDUCE BY OROTIC ACID. *(E.)*

Kotaki, A. (Fac. Med., U. Nagoya Japan), M. Okumura, S. H. Hasan and K. Yagi. *J Vitami* 16(1):75-79, 1970.

To determine whether or not any synergistic action between vitamins, myoinositol and choline exists in improving or preventing fatty liver induced by orotic acid containing diet for 7 days, 5 groups of 3 male rats (about 100 g body weight) each were used. Group A received a normal diet and the remaining groups were given rations containing 1.5% orotic acid; group B being fatty liver control, group C received daily s.c. injections of 30 mg myoinositol, group D choline (30 mg), and group E myoinositol (30 mg) plus choline (30 mg). Induction of fatty liver was accompanied by an increase in the lipid thiobarbituric acid (TBA) value and by a decrease in the lipid phosphorus concentration. Fat accumulation was prevented 20 to 50% by the injection of myoinositol or 90% by choline injections. However, the effects of choline and myoinositol were not synergistic, but the effect due to the injection of both was rather close to the effect of myoinositol alone. The increase in lipid TBA value and the decrease in lipid phosphorus concentration were also found to be prevented by injecting these lipotropic factors.

6778 CHRONIC LIVER DISEASE AND PRIMARY LIVER-CELL CANCER WITH HEPATITIS-ASSOCIATED (AUSTRALIA) ANTIGEN IN SERUM. *(E.)*

Sherlock, S. (Royal Free Hosp., London, England), S. P. Niazi, R. A. Fox and P. J. Scheuer. *Lancet* 1(7659):1243-1247, 1970.

Seventeen male patients with chronic liver disease of at least 6 months duration and a positive serological test for hepatitis-associated (H.A.) Australia antigen are described. Seven patients had histories of acute viral hepatitis which had been treated with corticosteroids, while the remaining 10 patients had no past history of acute liver disease. Of the latter group, 4 presented symptoms of lethargy and malaise or abdominal pain. One patient showed only evidence of recent viral hepatitis and 4 showed persistent hepatitis or inactive post-necrotic scarring. These 5 patients are symptom free and prognosis is considered good. Six patients showed histological features of chronic aggressive hepatitis and in 4, there was also cirrhosis. Serum bilirubin, aspartate transaminase, and globulin levels tended to be lower and smooth-muscle antibody was absent from the serum or present only in low titre. Hepatic histological differences were not absolute although 3 of the H.A. group showed evidence of recent acute hepatitis. Five patients had primary liver cancer, and in 4, underlying cirrhosis was observed. Serum-α-fetoprotein was present in 2 of these 5 patients. Observations indicate that acute hepatitis, with positive H.A. antigen may be followed by chronic liver disease and cirrhosis and this can proceed to liver cell cancer.

779 PORTAL HYPERTENSION IN THE PRESENCE OF NORMAL LIVER MORPHOLOGY. *(E.)* Iber, F. L. Lemuel Shattuck Hosp., Boston, Mass.). *Ann NY Acad ci* 170(1):115-126, 1970.

hirty-eight case reports from Calcutta of portal ypertension occurring in the presence of normal iver morphology or in cirrhosis (classified as such y large surgical liver biopsies and splenic portalenagrams) were characterized mainly as noncirrhotic ortal fibrosis, hepatoportal sclerosis, schistosoiasis and malaria-related splenomegaly. In noncirhotic portal hypertension, the total hepatic blood low was approximately normal, indicating the kistence of initial presinusoidal lesions which dereased the total portal blood flow and which varied ı etiology, but included thrombophlebitis of the ortal vein, sinusoidal swelling and obstruction and ther causes. The diminished portal flow probably ed to an increased hepatic arterial inflow which as distributed unevenly through the sinusoids, relting (in time) in vasoconstriction of the outflow the sinusoids to assure a more uniform distribution the arterial blood.

'80 ARTERIALIZATION OF THE LIVER WITH PORTACAVAL SHUNT IN THE TREATMENT OF PORTAL 'PERTENSION DUE TO INTRAHEPATIC BLOCK. *(E.)* illard, J. N. (Hosp. Beaujon, Clichy, France), P. Benhamou and B. Rueff. *Surgery* 67(6):883-890, 70.

terialization techniques of the liver with a rtacaval shunt were compared in 10 patients for eatment of portal hypertension due to intrapatic shock. In the first group of 5 patients, prosthesis was inserted between aorta and portal in, whereas in the second group of 5 patients, astomosis was made between splenic artery and rtal vein. The prosthesis has been associated th excessive arterial flow which cannot be safereduced by stenosing of prosthesis. Intrahepatic olestasis may also occur with high arterial flow. ripping of the portal vein in the hepatoduodenal gament and stripping of the aorta may lead to verence of many lymphatic channels. Duodenal osion observed in one patient was similar to distive complications described after aortic prosesis. This technique has no action on hyperlenism. However, the anastomosis procedure may always be feasible, especially in obese patients. asms resulting from arterial stripping may lead arterial thrombosis. Arterialization of portal mk through splenic artery is the technique of ice. The value of arterialization of cirrhotic ver remains questionable.

31 STUDIES ON NUCLEAR 4.5 S RIBONUCLEIC ACID III OF NOVIKOFF HEPATOMA ASCITES LS. *(E.)* El-Khatib, S. M. (Baylor Coll. Med., ston, Texas), T. S. Ro-Choi, Y.C. Choi, and Busch. *J Biol Chem* 245(13):3416-3421, 1970.

ikoff hepatoma ascites cells transplanted into e albino rats 7 days prior to killing were colted from the peritoneal fluid and prepared for studies on nuclear 4.5 S RNA_{III}. After nuclear 4.5 S RNA was obtained in an electrophorectically homogeneous state by preparative electrophoresis on polyacrylamide gels, it was separated by chromatography on DEAE-Sephadex into 3 peaks, the last of which contained 4.5 S RNA_{III}, which is an extranucleolar species not found in the cytoplasm. This unique RNA species has an adenosine 3',5'-diphosphate residue as the 5'-terminal and 2'-O-methyl uridine as the 3'-terminal nucleoside. It has a very low T_m of 37.5°C and a molecular weight of approximately 28,000 based upon mobility in polyacrylamide gels and 5'-terminal analyses. Analysis of the alkali resistant dinucleotides showed that the 4.5 RNA_{III} contains 4 alkali-resistant dinucleotides, i.e., adenosine 2'-O-methyl-3'-phosphate, guanosine 2'-O-methyl-3'-phosphoryladenosine 3'-phosphate, and 2-guanosine-2'-O-methyl-3'-phosphorylguanosine-3'-phosphate residues. After hydrolysis with pancreatic RNase, analysis of oligonucleotide frequencies indicated that most of the molecule is cleaved into mono- and tetra-nucleotides, i.e., only 18% remaining in larger fragments. Compared with other 4-7 S nuclear RNAs, the isotope distribution in these oligonucleotides differs in that the percentage is lower in uridine and higher in adenine residues.

Acute Nonviral Hepatitis and Hepatic Injury

6830 HISTOCHEMICAL AND FUNCTIONAL EFFECTS OF PARACHLOROPHENOXYISOBUTYRIC ACID ON HUMAN LIVER. *(E.)*

De Magistris, L. (Inst. Geront., U. Florence, Italy), L. Baroni, L. Calabrese and M. Serio. *Pharmcol Res Commun* 1(4):347-352, 1969.

The histochemical and functional effects of parachlorophenoxyisobutyric acid were investigated on liver biopsy specimens obtained from 16 patients (8 men, 8 women, 51 to 79-yr-old) with cerebral atherosclerosis. After 3 to 4 weeks of treatment with the drug (1440 mg/day in 2 doses) no changes in liver glycogen, RNA or DNA content were observed, but fatty liver developed in 3 patients and inflammatory infiltration of the liver (lymphocytes, epitheloid cells, plasma cells and rare polymorphonuclear leukocytes) were seen in 2 patients. Patients suffering from fatty degeneration of the liver prior to treatment with para-chlorophenoxyisobutyric acid reported a higher incidence of side effects than the other patients, but no changes in liver function tests were observed in any of the patients. The varying degrees of fatty liver caused by para-chlorophenoxyisobutyric acid is attributed to a reduced incorporation of liver triglycerides into plasma lipoproteins.

6831 IRREVERSIBLE FIXATION OF INCREASED LEVEL OF MUSCLE TYPE ALDOLASE ACTIVITY APPEARING IN RAT LIVER IN THE EARLY STAGE OF HEPATOCARCINOGENESIS. *(E.)*

Endo, H. (Fac. Med. Kyushu U., Fukuoka, Japan), M. Eguchi and S. Yanagi. *Cancer Res* 30(3):743-752, 1970.

Livers from male rats placed on a diet containing 0.06% 3'-methyl-4-dimethylaminoazobenzene for 60 days were used to study muscle type aldolase activity with the use of antimuscle aldolase sera during a 60-day interval following termination of the diet. Histologic examination showed severe damage in the livers of the rats fed azo dye for 60 days. Some damage was still observable after 14 days following termination of the diet. Considerable recovery was seen after 30 days and there was no evidence of liver damage after 60 days. The mitotic rate was elevated following cessation of the azo dye administration from a normal of 0 to 3/4000 parenchymal cells in liver to 12 to 20/4000 cells; after 60 days it had returned to normal. Muscle type aldolase was elevated when compared to normals 60 days after termination of the diet although no appreciable differences were observed in total aldolase activity, soluble protein and DNA content. This change in muscle type aldolase was evident after only 15 days of azo dye administration. This elevation was maintained during a 300-day observation period. N,N'-2,7-fluorenylenebisacetamide produced a similar alteration in muscle type aldolase whereas 2-methyl-4-dimethylaminoazobenzene, a noncarcinogen, did not produce such a change.

6832 VITAMIN E AND HEPATOTOXIC AGENTS: III. VITAMIN E, SYNTHETIC ANTIOXIDANTS AND CARBON TETRACHLORIDE TOXICITY IN THE RAT. *(E.)*

Cawthorne, M. A. (Beecham Res. Lab., Tadworth, Surrey, England), J. Bunyan, M. V. Sennitt and J. Green. *Brit J Nutr* 24(2):357-384, 1970.

The protective effect of single and multiple p.o. and i.p. doses (100-1500 mg/kg of N,N'-diphenyl-P-phenylenediamine, ethoxyquin, vitamin E and butylated hydroxytoluene on the p.o. acute and subacute toxicity (liver necrosis and hepatic fat accumulation) of CCL_4 was studied in young adult male and female rats. Multiple p.o. doses of vitamin E given prior to CCL_4 increased survival in male but not in female rats while single p.o. doses given 24-72 hr previously also increased survival in males but decreased survival in females. Single i.p. doses of vitamin E did not affect survival in female rats. Vitamin E did not significantly affect CCL_4-induced accumulation of hepatic triglycerides; however, p.o. doses of 2000 mg/kg administered prior to CCL_4 significantly increased hepatic triglyceride accumulation and morbidity. Multiple and single p.o. doses of N,N'-diphenyl-diphenylenediamine given 72 hr prior to CCL_4 increased survival in male and female rats while single p.o. doses given 6-48 hr prior to CCL_4 had no effect on survival. N,N'-diphenyl-diphenylenediamine given p.o. 6-72 hr or i.p. 1-48 hr before CCL_4 induced accumulation of hepatic triglycerides. Ethoxyquin (single or multiple, p.o. or i.p. doses) was the most effective of the agents tested in reducing acute and subacute CCl_4 toxicity if given at least 48-72 hr prior to CCl_4. Butylated hydroxytoluene given p.o. 48 hr before CCl_4 was similar to ethoxyquin in its protective effect, but i.p. doses were ineffective. No correlation between the concentration of these antioxidants in the liver (vitamin E was high, while ethoxyquin and butylated hydroxytoluene were minimal) and the time of their greatest protective effect against CCl_4 toxicity was found, suggesting that their modes of action are indirect and different and not related to their antioxidant properties.

6833 RECURRENT HEPATITIS IN PATIENTS RECEIVING MULTIPLE HALOTHANE ANESTHETICS FOR RADIUM TREATMENT OF CARCINOMA OF THE CERVIX UTERI. *(E.)*

Hughes, M. (Dept. Med., U. Queensland, Brisbane, Australia) and L. W. Powell. *Gastroenterology* 58(6):790-797, 1970.

Severe acute hepatocellular jaundice was reported in 6 patients who had received multiple halothane anesthetics for radium treatment of carcinoma of cervix uteri. In 5 of the 6 patients, recurrent episodes of unexplained fever, bilirubinuria, or jaundice followed separate exposures to halothane; two patients died in acute hepatic coma. An additional 320 patients have received radium treatment with non-halothane anesthetics with occurrence of only 1 case of hepatocellular jaundice. Fever of 100°F (37.7°C) is not uncommon for 24-48 hours following radium insertion and the incidence of early (occurring within 5 days) unexplained fevers after halothane did not differ significantly from that after non-halothane anesthetics. However, there was a significant increase in late (after 5 days) postoperative fever after halothane anesthetics, while a study of 50 patients receiving multiple nonhalothane anesthetics for radium treatment of cervix uteri carcinoma revealed no evidence of late postoperative fever and no biochemical or clinical evidence to indicate liver damage.

834 LIVER CELL DEFECATION: AN ELECTRON-MICROSCOPE STUDY OF THE DISCHARGE OF LYSOSOMAL RESIDUAL ODIES INTO THE INTERCELLULAR SPACE. *(E.)* Kerr, J. . R. (U. Queensland Med. Sch., Brisbane, Australia. *Path* 100(2):99-103, 1970.

he discharge of lysosomal residual bodies into the ntercellular space by liver cell autophagic vacuoles as studied by electron microscopy in 10 male rats, ed on a high protein, vitamin E-rich diet. An ntense autophagocytosis in the liver cells was nduced by an i.p. injection of albitocin (1 mg/kg) n 8 rats, with 2 rats serving as controls. The njected animals were sacrificed at 12, 15, 18 and 4 hr after injection, and liver tissues were removed, ixed in phosphate buffered osmium tetroxide and tained with uranyl acetate or lead citrate. In the ats injected with albitocin, the increased phago-ytosis was accompanied by dense residual bodies esulting from increased cellular defecation. Resi-ual bodies tended to aggregate around bile canaliculi nd along the plasma membranes, and a large amount f the debris containing remnants of cytoplasmic rganelles appeared in the space of Disse and in the pace between parenchymal cells. This debris in the xtracellular space did not resemble the fragments f disintegrating necrotic cells, and had originated rom the autophagic vacuoles that discharged their ontents through the plasma membrane. Lysosome rem-ants were not detected in the bile canaliculi, the pace between parenchymal cells or in the space of isse in the control animals.

835 HEPATIC HEMORRHAGE IN TOXEMIA OF PREGNANCY. *(E.)* Castaneda, H. (Hosp. 20 de Noviembre, exico City, Mexico), H. Garcia-Romero and M. Canto. *mer J Obstet Gynec* 107(4):578-584, 1970.

evere hepatic hemorrhage was reported in 6 patients ith toxemia of pregnancy. Diagnosis supported by iver scanning was made in 3 cases on clinical grounds nd these 3 patients receovered completely after urgery. The degree of hemorrhagic lesion is very ariable, but can produce extensive destruction of iver and/or large subcapsular hematomas which can upture into the peritoneal cavity; death of the atient usually results. Initial symptom of hepatic emorrhage in eclamptic patients was upper abdominal ain which can occur at any time during pregnancy nd probably reflects some degree of liver damage. udden occurrence of severe pain in the epigastrum, ight upper quadrant of abdomen, right shoulder, and umbar region in toxemic patient may be indicative f hepatic hemorrhage. If pain is accompanied by epatomegaly, hypotension, jaundice, leukocytosis nd anemia, hepatic hemorrhage diagnosis must be trongly suspected. Severe hepatic hemorrhages ave occurred after fourth month of pregnancy or eeks after delivery, but usually occur in third rimester. Most patients are multiparas. Ante-edent of pre-eclampsia and moderate epigastric ain, even a month before, are useful in making orrect diagnosis.

LIVER AND BILIARY TRACT

Acute Viral Hepatitis

6854 INHIBITED LYMPHOCYTIC RESPONSE TO PHYTOHEMAGGLUTININ (PHA) IN ACUTE INFECTIOUS HEPATITIS AND IN CHRONIC AGGRESSIVE HEPATITIS: INDIRECT EVIDENCE FOR VIRUS PERSISTENCE IN CHRONIC AGGRESSIVE HEPATITIS? *(E.)* Martini, G. A. (Med. U. Clin. Marburg, Germany), R. Rossler, K. Havemann and W. Dolle. *Scand J Gastroent* 5(supp. 7):39-42, 1970.

The response of peripheral lymphocytes to phytohemagglutinin (PHA) from patients with acute infectious hepatitis and chronic aggressive hepatitis was studied. Lymphocytes from controls showed increase in RNA and DNA synthesis following PHA stimulation, while lymphocytes from patients with acute infectious hepatitis during the first 10 days of jaundice revealed a depressed, significantly inhibited RNA and DNA synthesis. Lymphocyte reaction to PHA was also inhibited in chronic aggressive hepatitis. Some patients showed a depressed activity of lymphocytes and histologically, these patients showed a protracted acute hepatitis. The mechanism of stimulation of nucleic acid synthesis by PHA is unknown. An inhibited PHA response may indicate a functional lesion of lymphocytes. Manifestation of chronic aggressive hepatitis may be due to a relationship between genetically determined and virus induced immunological disturbance resulting in a self-perpetuating disease with or without virus persistenc

6855 IMMUNOGLOBULIN M (IgM) TURNOVER IN HEPATITIS. *(E.)* Jensen, K. B. (Bispebjerg Hosp., Copenhagen, Denmark). *Scand J Gastroent* 5(supp. 7): 33-37, 1970.

The variations in the synthetic and catabolic rates of serum immunoglobulin M (IgM) were evaluated by measuring daily levels of IgM (by gel filtration methods) and measuring the turnover of radioiodine-labeled IgM in 7 patients with infectious hepatitis, 6 with serum hepatitis, 2 with toxic hepatitis and one with chronic hepatitis. Three of 7 patients with infectious hepatitis had normal IgM turnover with normal synthesis rates (range: 0.7-7.3 mg/kg/day); two had increased catabolic rates of 13.9 and 15.2%/day of IgM (normal range: 7.5-13.6%/day) and normal concentrations of IgM; and 2 patients had elevated serum IgM levels of 1.53 and 5.40 g/l (normal range: 0.27-1.40 g/l) due to increased synthesis rate and normal functional catabolic rate of IgM. In 5 of 6 patients with serum hepatitis, the serum IgM concen-

ations were normal (range: 0.47-1.18 g/1) and
erum synthesis rates of IgM were a high normal (range:
2-18.1 mg/kg/day). In one patient with serum hepa-
tis the serum IgM level was 5.19 g/1, due to the
esence of IgMK M-components in the serum, an in-
eased IgM synthesis rate of 18.3 mg/kg/day and a de-
eased catabolic rate of 6.5%/day of IgM. The patient
th chronic hepatitis had a normal IgM turnover, and
e of the 2 patients with toxic hepatitis had an
evated fractional catabolic rate of 14.5%/day of IgM.
ere were no significant differences in the IgM
rnover patterns in infectious and serum hepatitis,
d serum IgM concentration apparently does not re-
ect abnormalities in the underlying synthesis and
tabolic rates.

56 HEPATITIS AND BONE MARROW DEPRESSION. *(Ger.)*
Wille, L. (Child. Clin. U. Heidelberg,
rmany) and P. Griss. *Monatsschr Kinderheilk*
8(4):114-118, 1970.

inical and anatomopathological features of three
ses of bone marrow depression following viral
patitis in children are reported. The children
ed between 5 and 11 weeks after the onset of
patitis, when its acute phase was over. Bone
rrow depression was not due to autoimmune reaction,
though in one of the cases, the complication might
ve been induced by chloramphenicol. No etiologic
nnection between the two diseases such as viral
fection, hypersplenism, or constitutional factors
uld be ascertained.

57 HEPATITIS IN YOUNG DRUG USERS. *(E.)* Jersild,
T. (Vestre Hosp. Copenhagen Prisons, Denmark),
Johansen, J. T. Balslov, K. Hojgaard, A. Johansen
C. Ott. *Scand J Gastroent* 5(supp. 7):79-83, 1970.

serum transaminase levels were found to be eleva-
to over 100 µmoles/min/1 in 194 of 680 young drug
rs. Liver biopsies were obtained from 100 of these,
men, 1 woman, average age 20.8 years, and practically
of whom inoculated the drug. The liver disease
k a mild clinical course in most cases and hepatic
ufficiency was not encountered at any time. Ninety-
ee percent of the examined patients presented his-
ogical signs of virus hepatitis, classified as mild,
erate, or severe based primarily on the occurrence
'piecemeal' necroses. In 30%, increased amounts
connective tissue were found to be concentrated in
portal spaces, but signs suggestive of cirrhosis
e not observed. Bilirubin levels (above 30 µmole/
/1) were observed in 97%, corresponding fairly well
h the serum transaminase findings. Biochemical
ivity correlated with the histologically demonstrated
erity of the observed hepatitis, and in patients
whom the histological changes were of severe nature,
disease would take a more protracted course.

8 COMPUTER ANALYSIS OF LIVER FUNCTION TESTS
AND THEIR INTERRELATIONSHIPS IN 347 CASES
VIRAL HEPATITIS. *(E.)* Zimmerman, H. J. (VA Hosp.,
ton, Mass.), P. Rozen and R. J. Korn. *Israel J*
Sci 6(1):67-79, 1970.

Computer techniques were used for analyzing and evaluating liver function tests in 347 patients with nonfatal, icteric hepatitis. Results provided a statistical description of biochemical changes during disease, their interrelationships and relative diagnostic significance. Specifically, the maximum activity of serum glutamate-oxalacetate transaminase (GOT), phosphohexose isomerase and age of patient, correlated significantly with the degree of jaundice developed. Calculated rates of decrease in bilirubin, GOT and glutamate-pyruvate transaminase (GPT) were 7.7, 11.7 and 10.5% of peak value per day, resp. The computer developed a description equation for predicting the duration of jaundice; factors significantly influencing the equation were maximum degree of hyperbilirubinemia, serum GOT and GPT activity, and the patient's age. Patients with serum hepatitis showed more severe deviations in liver function tests than those classified as having infectious hepatitis. Low values for many correlation coefficients reconfirm the relatively low specificity of most individual liver function tests, especially differential diagnosis of viral hepatitis and other jaundiced states.

6859 SERUM GUANASE ACTIVITY IN VIRAL HEPATITIS AND SOME OTHER HEPATIC AND EXTRAHEPATIC DISEASES. *(E.)* Giusti, G. (Clin. Infect. Dis., U. Naples, Italy), B. Galanti and A. Mancini. *Enzymologia* 38(6):373-382, 1970.

Serum guanase activity was determined in normal healthy subjects and in 167 patients with hepatic and extrahepatic diseases, including acute viral hepatitis (63 cases), obstructive jaundice (30 cases), cirrhosis of liver (26 cases), neoplasms (32 cases), typhoid fever (15 cases) and bacterial cholangitis (11 cases). Serum guanase activity was determined by spectrophotometry (Kalckar method) for all subjects, and also serum aspartate aminotransferase, alanine aminotransferase and bilirubin values were obtained from patients with acute viral hepatitis. In normal healthy subjects the mean value of serum guanase activity was 2.58 IU/1 at 37°, with a range of 0 to 7 IU/1. In 50 patients with acute viral hepatitis the guanase activity was higher with a mean value of 18.62 IU/1 (range: 2-69 IU/1), and in 13 patients with viral hepatitis with coma the mean value of guanase activity was 97.23 IU/1 (range: 37-212 IU/1). Patients with other types of hepatic and extrahepatic diseases had normal levels or slightly elevated levels of serum guanase activity. In 30 patients with obstructive jaundice the mean guanase activity was 5.03 IU/1, and in 21 patients with cirrhosis of the liver but no coma the mean activity was 6.85 IU/1. In patients with acute viral hepatitis there was a statistically significant correlation between the serum guanase values and those of serum alanine aminotransferase and those of serum aspartate aminotransferase. There was no correlation between serum guanase activity values and serum total bilirubin values.

6860 AUSTRALIA/SH-ANTIGEN AND DISEASES OF THE LIVER: PRELIMINARY INVESTIGATIONS OF DANISH DRUG ADDICTS AND PATIENTS WITH CHRONIC LIVER DISEASES. *(E.)* Reinicke, V. (Bispebjerg Hosp., Copenhagen, Denmark) and E. Nordenfelt. *Scand J Gastroent* 5(suppl. 7):85-88, 1970.

The Ouchterlony technique was used in this study of the possible presence of Australia (Au/SH) antigen in the serum of 60 patients addicted to drugs by injections, and 72 patients with chronic liver diseases confirmed by biopsy (including 20 with chronic hepatitis). Nineteen of the 60 drug addicts had biochemical signs (3 to 40 times increase of serum transaminase and elevated alkaline phosphatase) of a very active acute hepatitis at the time of blood-drawing. Fifteen of these 19 were icteric with a maximal value of serum-bilirubin of 10.6 mg%. Of these 19 patients, 42% were found to have Au/SH-antigen in the serum. Of 36 of the drug addicts without biochemical evidence of hepatitis 1 was found to be Au/SH-antigen positive. Sera from the 72 patients with chronic liver disease with the activity of the disease as estimated from biochemical parameters varying from only slightly elevated serum transaminase levels to strongly increased serum transaminase, alkaline phosphatase and bilirubin values, were persistently Au/SH-antigen negative.

LIVER AND BILIARY TRACT

Cirrhosis

5 PULMONARY CIRCULATION IN PORTAL HYPERTENSION. *(E.)* Martini, G. A. (Med. Clin.,
lipps U., Marburg, Germany), H. Arndt, G. Baltzer,
Buchta, A. Hardewig, W. Marsch and H. A. Schmidt.
NY Acad Sci 170(1):280-295, 1970.

relationship between portal hypertension result-
from liver cirrhosis and the pulmonary circulation
investigated in human patients with liver cirrhosis
hepatic disease. Arterial blood samples were
ied for oxygen and CO_2 concentrations, pO_2, pCO_2
hemoglobin concentrations and systemic and pul-
ry arterial and wedge pressures were also measured.
nistration of histamine (0.024 mg/kg/hr, i.v.)
lted in decreased arterial and increased venous
with a mean pO_2 difference of 10.7 mm Hg in cir-
ic patients and 31.6 mm Hg in patients without
tic disease and cardiac output was also found
e increased (10.13 to 15.03 l/min). Pulmonary
rial pressure was not changed during histamine
nistration. Cirrhotic patients showed arterial
turation from 91 to 94% with increased alveolar-
rial oxygen gradients from 11 to 39 mm Hg. The
pheral arterial unsaturation seemed to be due
ncreased blood flow through arteriovenous anasto-
s involving the peripheral and splanchnic area
ell as the pulmonary area.

FUNCTIONAL RENAL FAILURE IN CIRRHOSIS: RECOVERY AFTER PORTACAVAL SHUNT. *(E.)*
oeder, E. T. (Upstate Med. Ctr., St. U. New York,
cuse), P. J. Numann and B. E. Chamberlain. *Ann*
rn Med 72(6):923-928, 1970.

se of spontaneous, severe and prolonged oliguric
tional renal failure was reported in a 44-year-
woman with alcoholic cirrhosis. During a 14
period, there was oliguria, unimproved by plasma
nsion, and progressive uremia requiring periton-
dialysis. When death from uremia and hepatic
appeared imminent, a portacaval shunt was constructed as an elective procedure to reverse renal failure. Improvement in renal function began immediately after surgery and creatinine clearance rose from 8 to 75 ml/min. Presurgical abnormalities of blood pressure, hyperaldosteronism, renal dilution mechanisms, and plasma renin returned to normal or near normal values after surgery. Physiological changes resulting from the surgical procedure seemingly were responsible for recovery of normal renal function.

6877 INCREASED CELLULAR IMMUNOLOGICAL RESPONSE IN PATIENTS WITH CHRONIC LIVER DISEASE. *(E.)* Soborg, M. (U. Hosp. Copenhagen, Denmark) and N. Tygstrup. *Scand J Gastroent* 5(supp. 7):43-47, 1970.

The immunological responsiveness of patients with cirrhosis (8 female, 5 male; aged 17-75 yr) was compared with that of patients suffering from various disorders without known liver involvement (13 female, 3 male; aged 18-80 yr) after primary immunization by s.c. injection of 10^9 heat-killed *Brucella abortus Bang* bacteria. Fourteen days after the antigenic challenge, cellular hypersensitivity was assessed by the leucocyte migration test, based upon the inhibitory effect of antigen upon the *in vitro* migration of leucocytes originating from an organism with cellular hypersensitivity towards the antigen. Patients with cirrhosis developed a higher degree of cellular hypersensitivity than the control patients although the immunologic response of the humoral type as expressed by the titer of agglutinating antibodies was not significantly different in cirrhotic and control patients.

6878 TREATMENT OF POSTNECROTIC CIRRHOSIS WITH 6-MERCAPTOPURINE: WITH A SPECIAL VIEW TO THE POSSIBLE VALUE OF LONG-TERM TREATMENT WITH SMALL DOSES. *(E.)* Faber, V. (Blegdams Hosp., Copenhagen, Denmark) and O. Jessen. *Scand J Gastroent* 5(supp.7):55-59, 1970.

Ten patients with long-standing histologically verified postnecrotic cirrhosis were treated with a 50 to 100 mg daily dose of 6-mercaptopurine (6-MP) for 3 to 6 weeks. Patients were selected only if corticosteroids for 6 months to 9 years had produced severe side-effects or had failed. In 6 series (5 patients) remission occurred after 7 to 10 days while in 3 series (3 patients) improvement was moderate, and in 5 series (4 patients) there was no response. In 10 series, treatment was discontinued because of leucopenia (4 cases), exanthema and fever (1 case), increased bilirubin level without rising enzyme levels (1 case), evidence of increasing liver cell damage (1 case) or no response (3 cases). Remission was maintained in 4 patients for 3 to 5 years by daily doses of 12.5 mg 6-MP, while prednisone dosage was reduced to 5 to 10 mg/day. Prompt relapses occurred when treatment with 6-MP was discontinued after 6 to 12 months, but new remissions resulted when treatment was resumed. Clinical remissions may result from relatively small doses of 6-MP combined with small amounts of corticosteroids.

6879 HEPATIC AND UMBILICOPORTAL CATHETERIZATION IN PORTAL HYPERTENSION. *(E.)*

Viallet, A. (Hosp. St. Luc, Montreal, Quebec, Canada), A. Legare and P. Lavoie. *Ann NY Acad Sci* 170(1):177-192, 1970.

Combined hepatic and umbilicoportal catheterization was studied in 43 cirrhotic patients (39 males and 4 females, aged 29 to 67 years; and portohepatography obtained, with the coronary vein opacified in 38 patients. In 43 patients, wedged hepatic venous pressure values correlated well with free portal venous pressure values. The difference between free portal venous pressure and free hepatic venous pressure (the portohepatic gradient) was used as an index of portal hypertension and a comparison of the size of coronary vein varices with the portohepatic gradient showed a significant correlation. Umbilicoportal catheterization appears to be safer than splenic puncture, since it is performed under clear visualization of the structures involved, and risk of laceration is minimized.

6880 ALBUMIN AND IgG TURNOVER STUDIES IN PATIENTS WITH CIRRHOSIS. *(E.)*

Ramsoe, K. (Govt. Hosp., Copenhagen, Denmark), H. Westergaard, S. Jarnum, M. Jorgensen, T. Schiodt and N. Tygstrup. *Scand J Gastroent* 5(supp. 7):25-31, 1970.

Albumin and IgG turnover was simultaneously determined in 23 unmedicated patients with cirrhosis by tracing radioiodination of highly purified proteins. In 13 patients galactose elimination capacity and maximum sulfobromophthalein transport and storage capacity were related to protein radioactivity. Chronic alcoholism was a possible etiology of cirrhosis in 2 patients, and in the remainder, the etiology was unknown. Jaundice was present in 12 patients, hepatomegaly in 5, and ascites in 8 patients. In 25 control patients, without disorders affecting albumin and IgG metabolism, 19 albumin and 14 IgG turnover studies were done. In 23 cirrhot patients the mean albumin synthesis rate was reduced 7.1 g/day from a normal value of 10.7 g/day, and the IgG synthesis rate rose from a control value of 2.1 g/day to 11.2 g/day. In cirrhotic patients there wer significantly lower values for albumin serum concentr tions (29 g/l vs 42 g/l for controls), in intravascul mass of albumin (94 g vs 123 g in controls), and in t fractional catabolic rate of albumin (7.7%/day vs 8.7 day for controls). Cirrhotic patients also had signi ficantly higher IgG turnover values than control patients. In these patients, IgG serum concentration h a mean value of 31.2 g/l compared with 10.6 g/l in co trols; IgG intravascular mass was 99 g vs 30 g in con trols; IgG functional catabolic rate was 11.4%/day vs 6.8%/day in controls. There were positive correlatio between fractional catabolic rate of albumin and of I and between the distribution ratios of albumin and of IgG. The synthesis rates of both proteins were not correlated. There was a highly significant negative correlation between the serum concentration of albumi and the intravascular mass of IgG, and between the sy thesis rate of IgG and of serum albumin.

6881 THE EFFECTS OF AZATHIOPRINE IN PATIENTS WITH CIRRHOSIS OF THE LIVER. *(E.)*

Ranek, L. (Govt. Hosp., Copenhagen, Denmark), T. Schiodt, M. Soborg and N. Tygstrup. *Scand J Gastroent* 5(supp. 7):49-54, 1970.

Effects of azathioprine (Imurel) were studied in 7 patients with active cirrhosis and 7 with biliary cirrhosis. Duration of treatment varied between 1 month and 2 3/4 years while clinical improvement was noted in 7 patients, 5 were unchanged and became worse during treatment. During the observation period 4 patients died from bacterial sepsis and 2 from liver failure. Three of 4 patients in bad general condition before treatment died and 2 of 10 patients in good general condition died. There was no significant difference between survivors and patients who died during treatment with regard to sex of patients and type of cirrhosis. Of seven patient with initial serum bilirubin value of 5 mg/100 ml or more, 5 died and levels showed a marked increase before death. During treatment, serum transaminases fell significantly, unrelated to clinical effects, while serum gamma-globulin did not change. Bone mar row depression improved in 4 patients following reduction of azathioprine dosage. The average maintenance dose in surviving patients was 85 mg/day and 140 mg/day in patients who died. Azathioprine treat ment is probably of significant value in some cases of active cirrhosis, but not in advanced cirrhosis due to hepatotoxic side effects.

6882 INSULIN AND GLUCOSE METABOLISM IN LIVER CIRRHOSIS AND IN LIVER FAILURE. *(E.)*

Sestoft, L. (Bispebjerg Hosp., Copenhagen, Denmark) and J. F. Rehfeld. *Scand J Gastroent* 5(supp. 7): 133-136, 1970.

Glucose tolerance and insulin response to i.v. gluco loading were measured in 8 patients with histologica proven severe portal liver cirrhosis and hepatic com

patients with histologically proven cirrhosis without
igns of hepatic coma and 8 patients without disorders
f the liver or carbohydrate metabolism. The average
ge among the 3 groups ranged from 56 to 63 yr. The insul-
n response to glucose was significantly higher in pa-
ients with hepatic coma than in both cirrhotic and
ontrol patients (in the two latter groups the in-
ulin response was the same). In 5 patients given re-
eated i.v. glucose tolerance tests before and after
epatic coma the serum insulin values were doubled
r trebled after coma-treatment in 3 patients and
nchanged in 2. The mean fasting serum insulin in
atients with untreated hepatic coma was about 20
U/ml (about 12 μU/ml in both control and patients
ith liver cirrhosis). The glucose assimilation
oefficients and the mean fasting blood sugar were
ot significantly different, or were the same, in
he compared groups. Serum albumin in the coma
roup was about 26.7 g/1, and in the group without
oma about 40.5 g/1. No cases of hypoglycemia were
bserved. Liver failure appears to be accompanied by
yperinsulinism, whereas compensated liver cirrhosis is
ccompanied by normal serum insulin levels.

LIVER AND BILIARY TRACT

Gallbladder and Biliary Tract Diseases

6911 THE PHARMACOLOGY OF CHOLELITHIASIS. PREVENTIVE AND THERAPEUTIC EFFECTS OF VARIOUS MEDICATIONS IN THE MOUSE. *(Fr.)* Besancon, F. (Paris, France), C. Marche, C. Barret and J. Parrot. *Therapie* 25(3):463-485, 1970.

Cholelithiasis, inducible in mice by feeding 0.5 g/100 kg sodium dehydrocholate for 4 months, was prevented by clofibrate (0.5 g/100 kg), cholestyramine (3 g/100 kg), d-thyroxine (2 g/100 kg), and diphenylhydantoin (0.2 kg/100 kg). Aspirin (2 kg/100 kg), sodium p-aminosalicylate (0.2 kg/100 kg), vitamin D_2 (2 g/100 kg), vitamin E (0.2 kg/100 kg) and phenylethylacetamide (0.8 kg/100 kg) were somewhat less effective than the former agents. Clofibrate also prevented lesions of the gallbladder which accompany lithiasis as well as cholic acid-induced lithiasis. Induced cholesterol stones were dissolved partially eithe by discontinuing the sodium dehydrocholate after 4 months or by adding clofibrate. However, complete dissolving of the stones or healing of the associated lesions was not achieved. These drugs were not effective on accelerated cholelithiases induced by overloading with sodium dehydrocholate

6928 EFFECT OF ENDOTOXIN ON THE ULTRASTRUCTURE OF LIVER AND BLOOD CELLS OF HAMSTERS. *(E.)*

Stewart, G. J. (Dept. Biol., Boston U., Mass.). *Brit J Exp Path* 51(2):114-117, 1970.

The effect of *E. coli* endotoxin (0.3 mg/100g intracardially) on liver and blood cell ultrastructure 30 min and 24 hr after injection was determined in hamsters. Specimens examined 30 min after injection resembled control tissue with typical parenchymal and lining cells but after 24 hr lining cells had distorted subcellular structure and had large gaps between cells putting the lumen in direct contact with the space of Disse and the parenchymal cells were vesiculated with distorted mitochondria and no glycogen. Blood platelets were no more than balloons with a few vesicles, white cells had exaggerated perinuclear zones with no mitochondrial structure, and red cells were aggregated.

6929 THE SIGNIFICANCE OF CENTRILOBULAR SINUSOIDAL CHANGES IN LIVER BIOPSIES. *(E.)*

Poulsen, H. (Comm. Hosp., Copenhagen, Denmark), K. Winkler and P. Christoffersen. *Scand J Gastroent* 5(supp. 7):103-109, 1970.

Significance of percutaneous liver biopsies, all with histological appearance of dilated central veins and sinusoidal engorgment as usually described in congestive heart failure, was investigated in 21 patients (significant centrilobular sinusoidal changes were found in 21 of 1000 biopsies). In 13 of 21 patients, a definite cause for elevation of hepatic venous pressure was observed (heart failure or caval compression). Six biopsies with sinusoidal centrilobular changes exhibiting 'passive congestion' in slight degree, 9 in moderate, and 6 in pronounced degree were found, while 4 cases did not involve intermediate zone. Confluent centrilobular necrosis was demonstrated in one case, while slight centrilobular fibrosis was found in 6. In 8 patients suffering from a variety of chronic disorders (malignant tumors, collagen disease) histologic changes were not caused by increased venous pressure nor by local pressure (thrombosis or tumor). These patients showed no clinical signs of passive congestion and many had low serum albumin concentrations, increased gamma globulin levels and 2 had unexplained hepatomegaly. Occurrence of sinusoidal dilation is not synonymous with congestive hepatopathy and when such cases are encountered, further examinations, such as right sided heart catheterization and pressure measurements in hepatic veins are recommended.

6930 THE GASTROINTESTINAL MICROFLORA OF IRRADIATED MICE: II. EFFECT OF ORAL ANTIBIOTIC ADMINISTRATION ON THE COLONIC FLORA AND SURVIVAL OF ADULT MICE. *(E.)*

Livstone, E. M. (U. Pittsburgh Med. Sch. Hosp., Pa.), T. Hersh, H. M. Spiro and M. H. Floch. *Yale J Biol Med* 42(6):448-454, 1970.

The effect of oral antibiotics on colonic bacterial proliferation, mean survival time and survival rate was studied in 100 90-day-old ICR mice exposed to lethal irradiation. Forty mice were used for *in situ* bacterial culture of colonic feces: 10 were untreated controls, 10 were given 1200r of whole-body X-irradiation and antibiotics (neomycin 50 mg/day; potassium penicillin G, 20,000 U/day), 10 were irradiated only, and 10 received only antibiotics. Two mice from each group were sacrificed at 1, 3, 5, 7, and 10 days after irradiation, and histopathologic and quantitative and qualitative bacterial culture determinations were made on intestinal tissues and colonic washings. Sixty mice were used in a survival study, in which 10 were untreated controls, 20 were irradiated, 20 were irradiated and received antibiotics, and 10 received antibiotics only. In the feces of irradiated mice there was an increase in coliform bacteria (10^{10}/g vs 10^{5}/g for controls) and in total aerobes (10^{10}/g vs 10^{7}/g for controls) on the tenth day after irradiation. There was also an increase in total anaerobes on the seventh (10^{9}/g vs $10^{7.5}$/g for controls) and tenth(10^{10} g vs 10^{8}/g for controls) days after irradiation. In antibiotic-fed mice on bacteria were cultured and only anaerobic and aerobic fungi were recovered in the media. Histologic examination of the colon revealed an unbroken mucosal surface in all animals, and none of the mice demonstrated bacterial or fungal invasion of the colon wall. All irradiated mice began to die on the eighth day post-irradiation. The mean survival time for irradiated mice was 10.7 days, and was not significantly different from the survival time of 11.7 days for antibiotic-fed irradiated mice.

6931 DISTRIBUTION OF ECHOVIRUS ANTIBODY IN SERUM NASOPHARYNX, RECTUM, AND SPINAL FLUID AFTER NATURAL INFECTION WITH ECHOVIRUS TYPE 6. *(E.)*

Ogra, P. L. (Sch. Med. St. U. New York, Buffalo). *Infect Immun* 2(2):150-155, 1970.

The distribution of echovirus 6 antibody in the serum, nasopharynx, rectum, and spinal fluid was studied in a group of children with naturally acquired echovirus type 6 infection, with or without meningeal involvement, by radioimmunodiffusion and autoradiography. The response in serum was characterized by sequential appearance of γM (detectable 1 day after onset of illness, γG (constituting the bulk of antibody present in the late serum) and rarely of γA antibody. The secretory response in the nasopharynx and rectum was limited to secretory γA immunoglobulin, detectable in half of the children about 2 weeks after onset of infection. By 4 weeks all children had appreciable levels of γA echovirus 6 antibody activity in both nasopharynx and rectum (titer: 3.2 and 5, resp.). γG was the only class of immunoglobulin detectable in the spinal fluid (2-12 mg/100 ml). No appreciable changes were demonstrable in the levels of γG immunoglobulins in the spinal fluid of the children without meningitis during the study period; however, in children with meningitis, total γG concentrations increased approximately 2-fold by 14 days of infection (7.4 mg/100 ml as compared to 3.8 mg/100 ml). At 90 days post-infection, similar mean levels of γG were observed in both groups. Echovirus 6 was recovered from the spinal fluid of 5 out of 6 patients tested with meningitis; no virus was recovered from the spinal fluid of children without meningitis. Apparently after short term acute infection with enteroviruses, the appearance of γG antibody in spinal fluid may be a reflection of increased transport of serum antibody, particularly of the γG immunoglobulin class.

;932 THE GASTROINTESTINAL MICROFLORA OF IRRADIATED MICE: I. RELATIONSHIP OF UCOSA AND MICROFLORA IN WEANLING MICE. *(E.)* Livstone, . M. (U. Pittsburgh Med. Sch. Hosp., Pa.), H. M. piro, T. Hersh and M. H. Floch. *Yale J Biol Med* 2(6):439-447, 1970.

he changes in the intestinal bacterial populations ccurring in the 10 day period following a lethal rradiation were correlated with histopathologic bservations in 28 male weanling ICR mice. Fourteen ice received 1200 r of whole-body radiation and the emaining 14 were used as untreated controls. At hr, and at 1, 2, 3, 5, 7, and 10 days following rradiation, 2 mice from each group were sacrificed nd sections of stomach, mid-jejunum and mid-colon ere prepared for histologic examination. From the emainder of each organ 0.1 g or 1 ml of luminal ontents were removed, diluted and cultured, and lices of each organ were weighed, homogenized, iluted and cultured. In fecal specimens there was n increase in total aerobes on the 5th (10^7/g vs $)^5$/g for controls), 7th (10^9/g vs 10^5/g for controls) nd 10th (10^8/g vs 10^6/g for controls) days following rradiation. Coliform bacteria increased with a aximum increase on the 7th (10^8/g vs 10^4/g for con- rols) day after irradiation. Bacterial counts of olonic washings showed an increase in total aerobes, specially on the 5th ($10^{2.7}$/g vs 10^1/g for controls) nd 7th (10^7/g vs 10^1/g for controls) day after ir- adiation. Bacterial proliferation appeared in the ucous layer and colonic wall, as well as within the olonic contents. Total aerobes increased in colonic omogenates on the 5th ($10^{5.8}$/g vs 10^1/g for controls) nd 7th ($10^{7.8}$/g vs 10^1/g for controls) days post- rradiation. Maximum histologic damage occurred in ntestinal mucosa on the first to third days, con- isting of epithelial cell vacuolation and edema, and enudation of the villi, but no microabscesses or pro- essive cellulitis was seen in damaged tissue. Bac- eria seemingly proliferate in the colonic lumen fol- owing irradiation and may invade the intestinal wall oducing bacteremia.

33 SOME EFFECTS OF PORTACAVAL ANASTAMOSIS IN THE MALE RAT. *(E.)* Kyu, M. H. (Inst. eurol., London, England) and J. B. Cavanagh. *it J Exp Path* 51(2):217-227, 1970.

fects of portacaval anastomosis on male rats were scribed. Five week, post-operative food consump- on showed operated animals ate 1/3 the amount of ntrols. From 5-8 weeks after operation, they ate lf as much as controls, while at 8 weeks or more, imals ate 2/3 or more of control amounts. Young ts (180-250 g) lost 10-20% of their original body ight, but were beginning to gain weight by 4th ek; pre-operative weights were reached by 10-14 eks. Older rats lost 20-30% of their original dy weight and did not gain weight until 7 weeks ter the operation; peak weight was reached at weeks. Examination of the portal vein at death vealed a patent vessel and there was no thickening evidence of recanalization of a thrombosis. Ad- sions around the operation site were present in l cases. Mean liver weight fell to less than half the mean normal within a week after operation, but increased steadily after 8 weeks. This increase closely paralleled the increase in body weight. Mean testicular weight showed a slow decline during the first five weeks to less than half of the mean normal weights, but increased slowly and reached normal values by 30-38 weeks. Plasma ammonium nitrogen reached a new level of 400-500 μg/100 ml postoperatively, but slowly decreased after 12 weeks. Neomycin reduced plasma ammonium concentration to half of the expected level; this was reversed by giving ammonium acetate in the drinking water. Feeding of a high protein diet, or blood daily, did not raise ammonium levels to the previous peak of 400-500 μg/ml. All features seemed to be linked and dependent upon the return of portal blood to the liver through adhesions around the operation site.

6934 TRIGLYCERIDE TRANSPORT IN PROTEIN-DEPLETED RATS. *(E.)* Flores, H. (Fac. Med. U. Chile. Santiago), W. Sierralta and F. Monckeberg. *J Nutr* 100(3):375-379, 1970.

The effect of plasma protein fractions containing protein precursors of low density lipoproteins on the tryglyceride transport from the liver was studied in protein-depleted male albino weanling rats. Experimental animals received a protein-free, low choline diet for 15 to 17 days, and control rats received standard laboratory diets. Labeled plasma proteins (50 mg/ml) were injected i.v. and ^{131}I-oleic aicd was injected i.m. The apoprotein of low density lipoproteins was prepared from the serum of normal fasted rats and the albumin from the preparation was used as a control injection. Serum triglycerides were determined by chromatographic methods and radioactivity of serum I-triglyceride was measured by a scintillation counter. Protein-depleted rats developed fatty livers, steatorrhea, mucosal lesions and symptoms similar to those of human kwashiorkor. Mean body weight in rats receiving control diet was 75 g and in the malnourished rats was 21 g. In normal rats, serum protein concentration was 6 g/100 ml, serum triglycerides measured 29 mg/100 ml and liver triglycerides were 5 mg/g; while in malnourished rats these respective values were 3 g/100 ml, 18mg/100 ml, and 18 mg/g. The injection into malnourished rats of 1 mg/g body weight of serum protein fraction containing apoprotein of low density lipoproteins raised the serum triglyceride level to greater than 30 mg/100 ml within 45 min after injection, and this level was maintained for 135 min. Injection of serum albumin in control rats produced no change in serum triglyceride levels. In the control rats the incorporation of ^{131}I-oleic acid into serum triglycerides following treatment with apolipoprotein was measured as 18,000 cpm/μmole and following treatment with albumin, was 30,000; while in the malnourished rats the apolipoprotein induced an incorporation value of 35,000 and the albumin only 9,000 cpm/μmole triglyceride. Impaired liver triglyceride is seemingly due to diminished availability of apoprotein of low density lipoproteins.

6935 *CANDIDA* ESOPHAGITIS IN CHILDREN WITH MALIGNANT DISORDERS. *(E.)*

Kaufmann, H. J. (Child. U. Hosp., Basel, Switzerland). *Ann Radiol* 13(3-4):157-162, 1970.

Occurrence of *Candida* esophagitis in children with malignant disorders is described. Dysphagia or vague retrosternal and/or abdominal pain with known predisposing factors indicate the possibility of this disorder. Predisposing factors for malignant diseases are leukemia, carcinomas, Hodgkin's Disease, and Lupus erythematodes and predisposing factors for non-malignant disorders include aplastic anemia, rheumatoid carditis, bacterial endocarditis, diabetes, ulcerative colitis, alcoholism and others after prolonged therapy with corticosteroids and/or broad spectrum antibiotics and/or cytostatic drugs and/or immunosuppressive agents. The incidence of *Candida* esophagitis in children under 1 year was 5.8% with a high incidence in the neonatal period and up to one month. Radiological findings showed a markedly disturbed or complete lack of esophageal wall motility. Alteration of the esophageal mucosa originated in the lower third of esophagus and extended upward as the condition became more severe. Individual lesions consisted of mucosal irregularities; ulcerations and rounded protrusions were also observed. Prompt therapy with Amphotericin B brought about complete disappearance of subjective complaints and regression of local lesions.

6936 PRIMARY HYPERPARATHYROIDISM AND EXOCRINE PANCREATIC FUNCTION: DISTURBANCES OF ENZYME AND ELECTROLYTE SECRETION IN DUODENAL JUICE WITH THE SECRETIN-PANCREOZYMIN TEST. *(Ger.)*

Goebell, H. (Med. Clin. Phillips U., Marburg, Germany), H. D. Horn, Ch. Bode and H. H. Gossmann. *Klin Wschr* 48(13):810-819, 1970.

The function of the exocrine pancreas was studied by a standardized secretin-pancreozymin-test in 24 patients with primary hyperparathyroidism (HPT). Nineteen of the patients were investigated before operation and 5 postoperatively. Activity of amylase, lipase, trypsin, chymotrypsin, carboxypeptidase A and the concentration of bicarbonate and calcium were measured in quantitatively collected duodenal juice. The activities of amylase and lipase in the serum were followed before and after the stimulation by secretin and pancreozymin. Out of 22 patients investigated before or within 10 days after the operation 12 showed a normal and 10 an abnormal function. The pancreatic disturbance was characterized by a lowered enzyme secretion with a normal or only slightly diminished secretion of bicarbonate. The duodenal concentration of calcium was normal (1.2 to 1.4 mmole/l) in the basal secretion and after secretin. After pancreozymin it was higher (2.3 mmole/l) in patients with normal enzyme secretion and significantly lower (0.8 mmole/l) in patients with disturbed enzyme output. A disturbed function of the exocrine pancreas in nearly 50% of the investigated patients existed without clinical signs of pancreatitis. Hypercalcemia seems to be the decisive pathogenetic principle, which exerts its influence mainly on the pancreatic acinar cell.

6937 FREQUENCY OF BLOOD GROUPS OF THE ABO AND Rh_o(D) SYSTEM IN PATIENTS WITH VIRAL HEPATITIS, CIRRHOSIS OF THE LIVER, BILE STONES, PANCREATITIS, UROLITHIASIS AND ULCERATIVE COLITIS. *(E.)*

Vesely, K.T. (Inst. Human Nutr., Prague, Czechoslovakia). *Rev Czechoslovak Med* 16(2):60-71, 1970.

The prevalence of different blood groups in various diseases was investigated by the use of 1886 case histories (440 epidemic hepatitis, 142 liver cirrhosis or chronic hepatitis, 680 with bile stones, 167 with pancreatitis, 57 with ulcerative colitis and 400 with urolithiasis). Patients with epidemic hepatitis showed a higher prevalence of blood group O (control 31.4%: patient 35.7%) and a reduced prevalence of group A (control 45.2%: patient 39.8%). The frequency of blood groups in patients with cirrhosis of the liver and chronic hepatitis was practically equal as in the control group; the same was true of 680 patients with bile stones. There was a statistically significant increase of group AB (control 6.7%: patient 12.1%) and also of Rh_o (D) negative antigen (control 15.8%: patient 23.4%) in patients with pancreatitis. The number of patients with ulcerative colitis was too small for serious reflections. In 400 patients with urolithiasis there was a marked increased incidence of group O and a reduced incidence of group A (control: 31.4, 45.3%: patient: 36.5, 40.4%, resp.). When 17 subjects of this group with stones in the urinary bladder were eliminated, the difference was statistically significant.

6938 NON-OCCLUSIVE INTESTINAL GANGRENE. *(E.)*

Larsen, A. (Inst. Path. City Cty. Aalborg, Denmark). *Acta Chir Scand* 136(3):227-234, 1970.

Retrospective autopsy material of 43 patients with non-occlusive intestinal gangrene and 27 patients with superior mesenteric artery occlusion is presented in order to compare symptomatologic and etiological differences of the two conditions. No particular differences in symptomology were observed although patients with non-occlusive gangrene showed higher incidence of vomiting (approx. 75%) than patients with mesenteric artery thrombosis (approx. 40%). Highest hemoglobin values measured were 25.8 g/100 ml in non-occlusive gangrene patients and 22.1 g/100 ml in patients with thrombosis. No patients suffered from uremia. Age and sex distribution and duration of diseases were almost the same in both. There was a higher incidence of cardiac diseases in cases of non-occlusive intestinal gangrene (70 to 90%) than in cases of thrombosis (65%). In occlusive gangrene, thrombo-embolic conditions were more frequently observed in other sites than the alimentary canal. Failure in protective mechanisms of the intestine against intestinal content seemingly occurs in non-occlusive gangrene. Failure may be produced by a lowered oxygen tension in intestinal epithelium as a result of a combination of two or more of the following factors: cardiac disease, pulmonary disease, arteriosclerosis and increased blood viscosity.

6939 IMMUNOGLOBULINS AND ANTIBODIES IN GALLBLADDER BILE. *(E.)* Keclik, M. (Tulane U., Delta Primate Res. Ctr., Covington, La.), R. H. Wolf, and O. Felsenfeld. *Amer J Gastroent* 54(1):19-29, 1970.

Immunoglobulins (Igs) and their antibodies were studied with immunological techniques (radial diffusion, hemagglutination, complementation, and toxin titration of antibodies) in 16 patas monkeys and 4 baboons challenged with *Vibrio cholerae Ogawa*, strain 11 (1 to 1.3 x 10^9 viable cells) 11 days after cholecystectomy. Serum levels (mg%) of IgG, IgM, and IgA dropped slightly from their initial values (950 to 825, 300 to 250, and 175 to 150, resp.) on day 1 after surgery, then returned to the starting values; bile levels (mg%) of IgG and IgA rose from the normal levels (10 and 6, resp.) to 36 and 44, resp. on day 3 after challenge and returned to normal on day 14, while IgM was present in detectable amounts (5 to 10) only between days 2 and 4 after challenge; and stool levels (mg%) of IgG, IgA, and IgM were undetectable until 1 to 7 days after challenge. Precipitin levels reached maximum levels on day 14 for serum (1:720), days 3 to 6 for bile (1:140), and days 3 and 4 for stool (small amounts present), while vibriocidal activity in serum rose until day 7 (1:1270) and declined after day 14, in bile rose to a maximum during days 3 to 5 (1:330) and declined, and in stool was highest on days 3 and 4 with none detectable after day 7. Maximal titers of antitoxin activity were attained on day 5 after challenge in serum (3.8), in bile (3.0), and in stools.

6940 SIGNIFICANCE OF METHEMALBUMINEMIA IN ACUTE ABDOMINAL EMERGENCIES. *(E.)* Goodhead, B. (U. Texas Med. Sch., San Antonio). *Arch Surg* 101(3):376-378, 1970.

Presence of methemalbumin has been used to distinguish between acute hemorrhagic and edematous pancreatitis. Case reports are presented documenting evidence of methemalbuminemia with abdominal catastrophy not associated with acute pancreatitis. The first case involved a 24 year old woman with colicky lower abdominal pain, vomiting and serum positive for methemalbumin. The diagnosis was pelvic hematocoele from an ectopic gestation, which was evacuated with an uneventful recovery. Case 2 was a 31 year old man admitted for stenosis of an ileostomy stoma which was refashioned without difficulty. Bleeding around the toma subsequently developed, the hemoglobin fell and methemalbumin was found present in the serum. wo other cases are presented involving gangrenous leum and superior mesenteric thrombosis with small bowel infarction and gangrene. Pancreatitis was not present in any of these four cases.

6941 QUALITATIVE AND QUANTITATIVE RELATIONSHIPS OF THE FECAL FLORA IN CIRRHOTIC PATIENTS WITH PORTAL SYSTEMIC ENCEPHALOPATHY AND FOLLOWING PORTACAVAL ANASTOMOSIS. *(E.)* Floch, M. H. (Yale U. Sch. Med., New Haven, Conn.), J. Katz and H. O. Conn. *Gastroenterology* 59(1):70-75, 1970.

Aerobic and anaerobic organisms of the colon were qualitatively and quantitatively compared by bacteriological techniques after culturing on 9 selective media in normal subjects and in cirrhotic patients with or without portal systemic encephalopathy or portacaval anastamosis. Qualitatively, the spectrum of organisms in all the subjects were similar with bacteroides, lactobacilli, and coliforms found in all the subjects and streptococci found in all but 2 controls and 2 cirrhotic patients while clostridia, diphtheroids, and veillonellae were varied even though no statistically significant differences were obvious between groups. Quantitatively, anaerobic organisms were more common ($\log_{10}$ organisms/g stool) than aerobic with bacteroides found most frequently (9.3 in cirrhotic patients and 8.9 in normal) and anaerobic lactobacilli found next most frequently (8.6 in cirrhotic and 7.9 in control subjects). Coliforms were the most common aerobes in control subjects (6.8) but streptococci were often the most common in individual cirrhotic patients even though the overall mean was lower (6.1) than for coliforms. Statistically significant differences in microflora from normal and cirrhotic subjects were evident only in the increased anaerobics and bacteroides in cirrhotic patients.

6942 EFFECT OF CYCLOHEXIMIDE ON UNIDIRECTIONAL SODIUM FLUXES IN THE JEJUNUM AFTER CHOLERA EXOTOXIN EXPOSURE. *(E.)* Grayer, D. T. (Johns Hopkins U. Sch. Med., Baltimore, Md.), H. A. Serebro, F. L. Iber and T. R. Hendrix. *Gastroenterology* 58(6):815-819, 1970.

The effects of cycloheximide on unidirectional sodium fluxes were measured in jejunal loops of New Zealand rabbits exposed to cholera exotoxin. The animals were treated in one of 4 ways: group I was control; group II received 20 mg/kg cycloheximide i.v.; group III had cholera exotoxin instilled in the jejunal loop; and group IV had i.v. cycloheximide and exotoxin in the loop. The exotoxin caused an increased flux of Na$^+$ into the loop and this movement was completely abolished by cycloheximide. Sodium ion flux out of the lumen was not affected by the exotoxin or by cycloheximide. Since cycloheximide is an inhibitor of protein synthesis, its selective inhibition of cholera exotoxin-induced Na$^+$ and water flux into the jejunum suggests that the cholera effect is dependent on protein synthesis.

6943 ORAL IMMUNIZATION IN EXPERIMENTAL SALMONELLOSIS: II. CHARACTERISTICS OF THE IMMUNE RESPONSE TO TEMPERATURE-SENSITIVE MUTANTS GIVEN BY ORAL AND PARENTERAL ROUTES. *(E.)* Fahey, K. J. (Commonwealth Serum Lab., Parkville, Victoria, Australia) and G. N. Cooper. *Infect Immun* 2(2):183-191, 1970.

A temperature-sensitive mutant of *Salmonella enteritidis*, selected because of its inability to proliferate normally at 37°C, has been investigated as a living vaccine in mice. When given parentally (10^6) or orally (2.3×10^{10}), it conferred a high degree of resistance against otherwise lethal *S. enteritidis* infections given intraperitoneally (100, 40%, resp.)

or by mouth (100, 75%, resp.). In contrast to most other effective living *Salmonella* vaccines, the temperature-sensitive mutant survived for only short (2 weeks) periods in mouse tissues. Although the vaccine provided protection against *S. typhimurium* infection (63.5% survival), possibly because of antigenic relationships between the immunizing and challenge organisms, it was ineffective against the intracellular infection caused by *Listeria monocytogenes* (10% survival). A study of the kinetics of *S. enteritidis* infection in the liver and spleen of normal and immunized mice has suggested that immunity is dependent upon the development of a secondary immunological response which arises approximately 7 days after introduction of the challenge infection. Although humoral antibody production forms part of this secondary response, it is not necessarily responsible for control of the infection.

6944 ORAL IMMUNIZATION IN EXPERIMENTAL SALMONELLOSIS: III. BEHAVIOR OF VIRULENT AND TEMPERATURE-SENSITIVE MUTANT STRAINS IN THE INTESTINAL TISSUES OF RATS. *(E.)* Cooper, G. N. (Dept. Med. Microbiol., U. New South Wales, Kensington, Australia) and K. J. Fahey. *Infect Immun* 2(2):192-200, 1970.

The behavior of *Salmonella* organisms in the lymphoid tissues of the intestinal tract by infection of rats was studied via a Peyer's patch. The course of infection in the Peyer's patch and draining mesenteric lymph node was characterized by multiplication of the organism over a period of 4 days followed by a gradual decline in numbers; the organism also passed to the liver and spleen and was isolated from these organs as well as the intestinal tissues for at least 4 weeks. Temperature-sensitive mutants derived from the virulent strain were unable to multiply and did not pass to the liver and spleen; they remained viable for periods less than 2 weeks. *Salmonella* immunity apparently can only be induced by living vaccines and although viable organisms remain in the reticuloendothelial tissues, organisms given in a challenge infection are immediately subject to enhanced bactericidal activity within the intestinal tissues.

6945 IRON ABSORPTION IN KWASHIORKOR. *(E.)* Lynch, S. R. (U. Witwatersrand, Med. Sch., Johannesburg, Union of South Africa), T. H. Bothwell, D. Becker, H. Seftel, K. Stevens and J. Metz. *Amer J Clin Nutr* 23(6):792-797, 1970.

Sixteen infants between 6 and 20 months of age (10 male, 6 female) all with moderate degrees of kwashiorkor were studied in Johannesburg to assess the absorption of various types of iron using whole-body counting. Iron absorption was initially low in the 4 infants who received test doses of ferric chloride (0.5 mg iron labeled with 0.25 μC ^{59}Fe), ranging between 1% and 10%. Following refeeding for 1 to 5 months, absorption improved in all 4 from 9% to 53%. Ferrous sulfate (1.0 mg labeled iron) was well absorbed in 4 of 5 infants tested, showing 24% or more absorption, increasing in 2 infants tested to 50% to 60% after 6 to 8 weeks. Hemoglobin iron (1.0 mg iron) was well absorbed (initially 20% or more) in all 4 infants tested. Three infants were given $^{59}FeCl_3$ in normal gastric juice, which modestly enhanced the initial iron absorption to 11%, 12%, and 13%. No obvious association was noted between the percentage absorption and the marrow iron stores, the sideroblast count, the serum iron, the percentage saturation of transferrin, serum albumin concentration, and erythrogenic activity. Since ferrous iron and hemoglobin iron were well absorbed in the majority of subjects it is suggested that mucosal abnormalities were not responsible for the differing patterns of iron absorption noted in this study.

6946 MESENTERIC INFARCTION. *(E.)* Nathan, H. (Albert Einstein Coll. Med., Bronx, N. Y.), R. Bernstein and C. Blatt. *Amer J Gastroent* 53(6):539-551, 1970.

GENERAL

Parasitology

04 PORTAL HYPERTENSION AND SCHISTOSOMIASIS.
(E.) Von Lichtenberg, F. (Harvard Med.
h., Boston, Mass.). *Ann NY Acad Sci* 170(1):100-114,
70.

perimental induction of pipe stem fibrosis was per-
rmed in 6 young chimpanzees given a single exposure
250, 1000 or 2000 *Schistosoma mansoni* cercariae
d necropsied after 7 or 36 months, and in 4 other
impanzees exposed monthly to 100 or 250 cercariae
d necropsied between 24 and 36 months after the
rst exposure; there were 6 control animals. Para-
tological, hematologic, biochemical and serologic
terminations were performed. In the postmortem
udies, most of the schistosomes were found in the
stal branches of the mesenteric veins and were
tive and well developed. Organ egg assays revealed
correlation between eggs in tissues and extent of
inical and pathological involvement. In antemortem
udies, mean portal pressure and hepatic blood flow
terminations conducted in a number of animals near
e end of the experiment failed to demonstrate sig-
ficant differences. In a few animals, irregular
ld elevations in BSP retention and in serum trans-
inases were observed on some occasions as well
increases in total serum proteins. Antibody
velopment was quite similar for all animals. In
e livers of 3 chimpanzees, labeled globulin from a
ronically infected animal caused the staining of
gs within the granulomas and fibrous scars. There
was no evidence of *schistosoma* antigen beyond the confines of these granulomas. Pathological observations closely corresponded to stages seen in earlier surgical biopsies of the liver. These stages included mild portal inflammation without fibrosis, moderate fibrosis of small and some medium sized portal fields, fibrosis of large portal fields without granulomatous invasions, and established pipe stem fibrosis. By following development of the lesions in multiple successive biopsies and in the subsequent autopsy, it could be verified that the changes occurred regularly in this order but at variable individual rates and degrees of progression.

7005 ENHANCED PROLIFERATION OF H-1 VIRUS IN LIVERS OF RATS INFECTED WITH *CYSTICERCUS FASCIOLARIS*. *(E.)* Kilham, L. (Dartmouth Med. Sch., Hanover, New Hampshire), G. Margolis and E. D. Colby. *J Infect Dis* 121(6):648-652, 1970.

Susceptibility of adult rat liver to infection by Toolan's H-1 virus was enhanced by pre-infection of animals with *Cysticercus fasciolaris*, a larval form of *Taenia taeniae*-formis. A single control animal receiving virus alone and which had hepatic granulomas of unknown origin also developed a high viral titer, suggesting that the action of cysticerci in increasing susceptibility to H-1 viral infection was non-specific and due to damage and repair of tissues.

7006 A CLINICAL TRIAL OF IODOTHYMOL PIPERAZINE COMPLEX IN HOOKWORM INFESTATION. *(E.)* Janardhana Rao, K. (Med. Coll. Guntur, India) and K. Kothandaramiah. *Antiseptic* 67(4):281-283, 1 0.

7007 AN UNUSUAL CAUSE OF ACUTE ABDOMEN: A CASE REPORT. *(Jap.)* Lin, J. S. (Kumamoto U. Med. Sch., Japan) and H. A. Fan. *J Kumamoto Med Soc* 44(3):240-250, 2970.

7008 IS THE ONSET OF SCHISTOSOMIASIS IN EUROPE FICTION OR FACT? *(Fr.)* Bayon, N. (no affil). *Gazz Med France* 77(18):4049-4056, 1970.

7009 THE CIRCULATING IMMUNOGLOBULINS INVOLVED IN PROTECTIVE IMMUNITY TO THE INTESTINAL STAGE OF *NIPPOSTRONGYLUS BRASILIENSIS* IN THE RAT. *(E.)* Jones, V. E. (Nat. Inst. Med. Res., London, England), A. J. Edwards and B. M. Ogilvie. *Immunology* 18(5):621-633, 1970.

7010 NICLOSAMIDE TREATMENT OF CESTODIASIS: CLINICAL TRIALS IN THE UNITED STATES. *(E.)* Perera, D. R. (U.S. Publ. Hlth. Service, Atlanta, Ga), K. A. Western and M. G. Schultz. *Amer J Trop Med Hyg* 19(4):610-612, 1970.

7011 METRONIDAZOLE AND NIRIDAZOLE COMBINED WITH DEHYDROEMETINE IN TREATMENT OF CHILDREN WITH AMEBIC LIVER ABSCESS. *(E.)* Scragg, J. N. (Dept. Pediat., U. Natal, Union of South Africa), S. J. Powell. *Arch Dis Child* 45(240):193-195, 1970.

7012 INTRAPERITONEAL RUPTURE OF AN AMEBIC ABSCESS IN A PREGNANT WOMAN AT TERM. *(E.)* De Silva, K. (Dept. Obstet. Gynec., U. Ceylon, Colombo). *Ceylon Med J* 15(1):51-53, 1970.

7013 TAENIA INFESTATION OF THE VERMIFORM APPENDIX. *(E.)* Payne, J. E. (Roy. South Sydney Hosp., New South Wales, Australia). *Med J Aust* 1(15):768-769, 1970.

7014 PATHOGENESIS OF ANEMIA IN COSTA RICA: EPIDEMIOLOGIC STUDY OF HEMOGLOBIN AND SERUM PROTEIN LEVELS AND HOOKWORM INFECTION IN CHILDREN. *(E.)* Villarejos, V. M. (Louisiana St. U. Internat. Ctr. Med. Res. Training, San Jose, Costa Rica). J. Bickers, A. Rivera, A. Pena Chavarria, G. W. Hunter, III and E. Kotcher. *Amer J Trop Med Hyg* 19(4):603-609, 1970.

7015 HEALING RATE OF HEPATIC AMEBIC ABSCESSES: THEORY AND SCAN MEASUREMENTS. *(E.)* Spencer, R. P. (Yale U. Sch. Med., New Haven, Conn.) and G. S. Johnston. *J Nucl Med* 11(7):452-454, 1970.

7016 LIVER SCANNING: ANALYSIS OF 2500 CASES OF AMEBIC HEPATIC ABSCESSES. *(E.)* Cuaron, A. (Nat. Med. Ctr., Mexico City, Mexico) and F. Gordon. *J Nucl Med* 11(7):435-439, 1970.

7017 SYSTEMIC EFFECTS OF CHRONIC COLITIS: WITH SPECIAL EMPHASIS ON CHRONIC AMEBIC COLITIS. *(E.)* Kasliwal, R. M. (S. M. S. Med. Coll., Jaipur, India). *Amer J Proctol* 21(4):247-252, 1970.

7018 REDUCED LEVELS OF GLYCOGEN AND GLUCOSE-6-PHOSPHATASE IN LIVERS OF GUINEA PIGS INFECTED WITH *TRYPANOSOMA GAMBIENSE*. *(E.)* Marciacq, Y. (Dept. Biol., Tulane U. New Orleans, La.) and J. R. Seed. *J Infect Dis* 121(6):653-655, 1970.

7019 PARASITIC PROBLEMS IN PRACTICE: THERAPEUTIC GUIDELINES. *(E.)* Klein, N. C., (New York Hosp. Cornell Med. Ctr., New York) and D. T. Dennis. *Postgrad Med* 47(6):120-123, 1970.

7020 HYDATID DISEASE IN MAN. *(E.)* Nandi, R. L. (Dr. V. M. Med. Coll, Sholapur, India), S. B. Yadav, P. N. Patil and R. N. Sukla. *J Indian Med Profession* 16(9):7369-7372, 1969.

7021 TREATMENT OF CHILDREN WITH ACUTE AMEBIC DYSENTERY: COMPARATIVE TRIAL OF METRONIDAZOLE AGAINST A COMBINATION OF DEHYDROEMETINE, TETRACYCLINE AND DILOXANIDE FUROATE. *(E.)* Rubidge, C. J. (Dept. Pediat., U. Nairobi, Kenya), J. N. Scragg and S. J. Powell. *Arch Dis Child* 45(240):196-197, 1970.

DESCRIPTION OF INDEXES

BJECT and AUTHOR INDEXES for Gastroenterology Abstracts and Citations, Volume 5, are produced from on-line mputer print-out of key-punched cards.

e SUBJECT INDEX is based on a hierarchial system of classification in which *major index terms* are modified one or more *key word descriptors*. The *key word descriptors* are listed in decreasing order of importance d describe the content of the abstract or citation. In addition, in this indexing system, some *key word scriptors* will also be used as *major index terms*, thus providing in-depth indexing of each document. An stract or citation number, in brackets, will be found after the *key word descriptors*. Abstracts will be entified by an asterisk outside of the brackets.

illustrative example of this indexing system follows:

TESTINE, LARGE

Colon, Carcinoma, Radiological Detection, Rectum (0188)*

LON

Cancer, Polyps, Radiological Detection (0188)*

CTUM

Cancer, Polyps, Precancerous (0188)*

NCER

Large Intestine, Detection, Radiology (0188)*

AGNOSIS

Radiology, Cancer, Large Intestine (0188)*

Numbers followed by an asterisk refer to abstracts in the text. Other numbers refer to citations.

SUBJECT INDEX

ABDOMEN
    ACUTE, ASCARIASIS, PANCREAS (7007)
    ACUTE, LESIONS, AMMONIA, ULCER (6572)
    ATONIA, SURGERY, PREOPERATIVE PREPARATION (6977)
    BILHARZIASIS, EPIDEMIOLOGY, METEORISM (7008)
    EMERGENCY, METHEMALBUMIN, PANCREATITIS (6940)*
    ENTEROCOLITIS, CARDIOVASCULAR, STENOSIS, METEORISM (6947)
    FEVER, LYMPHOGRANULOMATOSIS, IRRADIATION, HODGKIN'S DISEASE (6539)
    MASS, NEONATE, RADIOLOGY (6963)
    PAIN, AMPULLA OF VATER OBSTRUCTION, PANCREAS (6916)
    PAIN, CARCINOMA, PANCREAS, STEATORRHEA (6739)
    PAIN, DYSPEPSIA, ULCER, PANCREATITIS (6551)
    PAIN, LIPOMA, OCCLUSION, HEMORRHAGE (6676)
    TRAUMA, DUODENAL, ADRENAL GLAND, PANCREAS (6541)
ABSCESS
    AMEBIC LIVER, METRONIDAZOLE, NIRIDAZOLE, DEHYDROEMETINE, CHILDREN (7011)
    AMEBIC LIVER, RUPTURE, PREGNANCY (7012)
    AMEBIC, LIVER, SCAN (7016)
    HEPATIC AMEBIC, HEALING RATE, SCAN (7015)
ABSORPTION
    CALCIUM, INTESTINE, VITAMIN D3 (6355)*
    CALCIUM, PARATHYROID GLANDS (6350)*
    FRUCTOSE, GLUCOSE, SERUM FREE FATTY ACID, TRIGLYCERIDES (6358)*
    GASTROINTESTINAL, POLYMERS, DRUGS (6376)
    GLUCOSE, JEJUNAL LOOP, WATER, NA, CL (6367)
    INTESTINAL, BLOOD FLOW (6364)
    INTESTINAL, RAT, AMINO ACIDS (6360)
    INTESTINE, SODIUM, AMINO ACID (6349)*
    IRON, AMINO ACID, CYSTEINE, METHIONINE (6353)*
    IRON, SUCCINIC ACID (6357)*
    IRON, VITAMIN B12, ATROPHIC GASTRITIS (6651)
    LIVER, TUMOR, K+, RB+ (6354)*
    SMALL INTESTINE, PROTEOLYTIC ENZYME (6368)
    STOMACH, INTESTINE, ISONIAZID (6366)
    VITAMIN B12, MALABSORPTION, ILEUM, INTRINSIC FACTOR (6375)
ACETYLCHOLINE
    SECRETION, PANCREATIC, BILIARY, REGULATOR (6416)
ACETYLCHOLINESTERASE
    HIRSCHSPRUNG'S DISEASE, PERISTALSIS (6717)
ACHALASIA
    ESOPHAGEAL, HYPERMOTILITY, SPASM, SPHINCTER (6601)
ACID
    SECRETION, GASTRIC, HISTALOG (6396)*
    SECRETION, STOMACH, ANTICHOLINERGICS, HISTALOG (6612)*
ACIDITY
    GASTRIC, AGE, HISTAMINE, MICE (6407)
ADDICTION
    AUSTRALIA, ANTIGEN, VIRAL, HEPATITIS (6860)*
    VIRAL, HEPATITIS (6857)*
ADENOCARCINOMA
    PANCREAS, ISLET CELL, VATER'S PAPILLA, ANEMIA (6744)
    STOMACH, EPITHELIAL CELLS, N-METHYL-N'-NITRO-N-NITROSOGUANIDINE (6610)*
ADHESION ILEUS
    PROPYLIODON, ABDOMINAL, OPERATION, PERISTALSIS (6574)
ADRENAL
    RESECTION, ALPHA-IRRADIATION, RNA POLYMERISE, LIVER NUCLEI (6458)
ADRENALECTOMY
    CORTISOL, PYRIDOXINE, FETAL RAT LIVER (6441)*
ADRENERGIC BLOCKING AGENT
    LIVER, AMINOTRANSFERASE, PHENTOLAMINE, PROPRANOLOL (6435)*
    PHENOXYBENZAMINE, PROPRANOLOL, MESENTERIC FLOW (6499)*
ALBUMIN
    BILIRUBIN, BINDING, KERNICTERUS (6770)*
    LIVER TURNOVER, CIRRHOSIS, SYNTHESIS (6880)*
    SERUM, CLEARANCE, PERITONEUM, FLUID FLUX, RABBIT (6373)
    SERUM, RADIOACTIVE GASTRIN, ELECTROPHORESIS, BLOOD (6402)
ALCOHOL
    ALCOHOLISM, BIOCHEMICAL LESION (6851)
    CIRRHOSIS, ASCITES, SURGERY (6906)
    CIRRHOSIS, LIVER, BLOOD GROUP (6890)
    GLYCEROL, INCORPORATION, LIVER SLICE (6442)*
    HEPATITIS, LIVER, FATTY LIVER (6846)
ALCOHOL DEHYDROGENASE
    COMPLEX, COENZYME, PYRAZOLE, KINETICS, BINDING (6436)*
ALPHA-FETOPROTEIN
    VIRAL, HEPATITIS, TUMOR, CORTICOTHERAPY, REGENERATION (6861)
AMINE
    GALACTOSAMINE HEPATITIS, OROTATE, LIVER (6845)
    HISTAMINE, 5-HYDROXYTRYTAMINE, DOPAMINE, GASTRIC MUCOSA (6404)
    HISTAMINE, GASTRIC ACIDITY, AGE, JUICE (6407)
    HISTAMINE, MAST CELLS, HISTOCHEMISTRY (6330)
    HISTAMINE, PENTAGASTRIN, GASTRIC FISTULA (6406)
    PHOSPHATIDYLETHANOL-, METABOLISM, ETHANOLAMINE, MOUSE (6487)
    STORING CELLS, GASTRIC MUCOSA, STAINING (6285)*
AMINO ACID
    ALANINE, LIVER, GLUTAMATE, OXOGLUTACATE, GUINEA PIG (6475)
    ESSENTIAL, ABSORPTION (6360)
    GASTRIC MUCOSA, CHIEF CELL, PRODUCTION (6288)*

  INTESTINAL TRANSPORT, CARBOHYDRATES (6363)
  INTESTINE, TRANSPORT, GOLDFISH (6372)
  IRON ABSORPTION, VEGETABLE, CYSTEINE, METHIONINE (6353)*
  LIVER, FIBRINOGEN SYNTHESIS, HORMONE, FAST, THROMBIN (6473)
  METHIONINE, CHANG'S LIVER CELLS, CELL, PROTEIN (6431)*
MONIA
  PERITONEAL FLUID, ACUTE, ABDOMEN (6572)
PULLA OF VATER
  CARCINOID, VON RECKLINGHAUSEN'S DISEASE (6726)
  DUODENOSTOMY, JEJUNOSTOMY, DUODENAL ULCER (6561)
  ENDOSCOPY, PANCREATOGRAPHY, PANCREOZYMIN (6516)*
  OBSTRUCTION, ABDOMINAL PAIN, PANCREAS (6916)
YLASE
  INTESTINE, RAT, ISOLATION, CHARACTERIZATION (6296)*
  PANCREATIC, PROPERTIES, STARCH, DIET (6418)
LGESIC
  ASPIRIN, GASTROINTESTINAL BLEEDING (6993)
  ASPIRIN INGESTION, PEPTIC ULCER (6661)
STOMOSIS
  ESOPHAGEAL ATRESIA (6596)
  ESOPHAGOGASTRIC, RECONSTRUCTION, SINGLE-LAYERED, GASTRIC MUCOSA (6589)
  ESOPHAGOJEJUNAL, GASTRECTOMY, RESECTION (6631)
  ESOPHAGUS (6592)
  ESOPHAGUS, ATRESIA (6597)
  GASTRODUODENAL, VAGOTOMY, ANTRECTOMY, RADIOLOGY (6648)
  PORTACAVAL, CIRRHOSIS, ADHESIONS, PORTAL HYPERTENSION (6887)
  PORTACAVAL, LIVER, WEIGHT, FOOD (6933)*
  PORTAL HYPERTENSION (6785)
  PORTAL HYPERTENSION, SHUNT SURGERY, CIRRHOSIS (6784)
  PORTAL SYSTEMIC SHUNT, HEPATIC CIRCULATION (6788)
MIA
  HEMOLYTIC, HEMANGIOENDOTHELIOMA, LIVER (6819)
  HOOKWORM, HEMOGLOBIN, PROTEIN, CHILDREN (7014)
  HYPOCHROMIC, THROMBOSIS, HERNIA, ULCER (6595)
STHESIA
  HALOTHANE, FULMINANT HEPATIC NECROSIS (6847)
  LIVER, CIRCULATION (6843)
  LIVER, HYPOTENSION, HYPOTHERMIA, TOXIC (6840)
URYSM
  ARTERY, HEPATIC (6824)
  BILIARY TRACT, HEPATIC ARTERY, GASTRODUODENAL ARTERY, POST-OPERATIVE (6822)
  HEPATIC, ARTERY, BILIARY TRACT (6822)
ANOMALY
  CONGENITAL, ANORECTAL, SURGERY (6719)
  CONGENITAL DIAPHRAGMATIC OCCLUSION, DUODENUM (6650)
  SMALL INTESTINE, MALROTATION, VOLVULUS, RADIOLOGY (6949)
  TRACHEOESOPHAGEAL FISTULA, ESOPHAGEAL ATRESIA, SURGERY (6588)
ANORECTUM
  MELANOBLASTOMA, HEMORRHOIDS, MALPIGHIAN, MUCOSA (6724)
ANTACID
  AMYLOPECTIN SULFATE, ULCER, DUODENUM (6658)*
ANTIBIOTIC
  CYCLOHEXIMIDE, SODIUM FLUXES, CHOLERA, EXOTOXIN (6942)*
  GASTROINTESTINAL TRACT, CANDIDA ALBICANS, STEROIDS, CYTOSTATIC (6982)
  NEOMYCIN, PENICILLIN, COLON, IRRADIATION (6930)*
  NYSTATIN, NEOMYCIN, FATTY ACID, CECUM, RAT (6512)
  PUROMYCIN, ULTRASTRUCTURE, POLYRIBOSOMAL DISAGGREGATION (6830)*
  TIRCINDAMYCIN, LIVER, MITOCHONDRIA, OXIDATIVE PHOSPHORYLATION, RAT (6469)
ANTIBODY
  ECHO VIRUS, NASO PHARYNX, SPINAL FLUID (6931)*
ANTICHOLINERGIC
  NACTON, ROBINUL, ACID, HISTALOG (6612)*
  PROPANTHELINE BROMIDE, ULCER, DUODENUM (6658)*
ANTIGEN
  AUSTRALIA, ACUTE VIRAL HEPATITIS, LIVER (6867)
  AUSTRALIA, HEPATITIS, CIRRHOSIS, CANCER (6778)*
  AUSTRALIA, HEPATITIS, EPIDEMIOLOGY, VIROLOGY, CARRIER STATE, DOWN'S SYNDROME, MENTAL RETARDATION (6864)
  AUSTRALIA, PLASMA, SERUM GLUTAMIC OXALACETIC TRANSAMINASE, HEPATITIS CARRIER (6862)
  AUSTRALIA, TRANSFUSION, HEPATITIS (6863)
  BLOOD GROUP A, GOBLET CELLS (6310)*
  SH, SERUM HEPATITIS, IMMUNO ELECTROOSMOPHORESIS (6518)*
  SKIN REACTIVE, CANCER, COLON, RECTUM, TUMOR (6694)*
ANTI-HISTAMINE
  GASTRIC ULCER, GASTRIN, AMINOGUANIDINE (6615)*
ANTI-INFLAMMATORY
  FLUFENAMIC ACID, ULCEROGENESIS, SMALL INTESTINE (6671)*
ANTRUM
  PYLORIC, PREPYLORIC, ENDOSCOPY, MUCOSA (6638)
ANUS
  ANORECTAL ANOMALIES, CONGENITAL, SURGERY (6719)
  IMPERFORATE, ANO-RECTAL RINGS (6778)

  MALIGNANT MELANOMA, RECTUM (6727)
  SPHINCTER, ELECTROMYOGRAPHY (6532). (6533)
APPENDICITIS
  CHRONIC, ETIOLOGY, RADIOLOGY, ANATOMOPATHOLOGY (6700)
  CHRONIC, LYMPHOCYTE, APPENDECTOMY (6721)
  PUERPERIUM, ACUTE, SURGERY, UTERUS (6702)
APPENDIX
  APPENDECTOMY, AGE (6711)
  APPENDICITIS, PEPTIC ULCER, DIVERTICULITIS (6961)
  CARCINOID TUMOR, ILEUM, RECTUM (6972)
  DIVERTICULOSIS, APPENDICITIS, SURGERY (6718)
  MUCOCELE, EXTRACECAL, ILEOCECAL, TUMOR (6726)
  TAENIA INFESTATION (7013)
ARGININE MALATE
  ALCOHOLIC, CIRRHOSIS, AMMONIEMIA (6884)
ARTERY
  HEPATIC, ANEURYSM (6824)
ASCITES
  ALCOHOLIC CIRRHOSIS, SURGERY, LIVER (6906)
  CIRRHOSIS, CORTICOIDS, DIURETICS, HEMODILUTION (6885)
  CIRRHOSIS, MANAGEMENT, HEPATIC COMA, DIURETICS (6901)
  CIRRHOSIS, PLASMA VOLUME, PORTAL HYPERTENSION, RENAL SODIUM RETENTION (6894)
  LIVER, CIRRHOSIS, SURGERY (6797)
ASPIRIN
  BLOOD LOSS, PERNICIOUS ANEMIA, GASTRIC MUCOSA (6614)*
ATONIA
  SURGERY, ACUTE, LAPAROTOMY, MOTILITY (6977)
ATP
  HEPATOCARCINOGENESIS, MITOCHONDRIA, MICROSOME, ETHIONINE (6812)*
ATRESIA
  ESOPHAGEAL, INFANT, COLON, TRANSPLANT (6583)
ATROPINE
  MESENTERIC, ARTERY POSTPRANDIAL, DILATION (6499)*
AUTOIMMUNOLOGY
  HEPATITIS, CHRONIC, COLLAGEN DISEASE, CIRRHOSIS (6871)
AUTONOMIC GANGLIA
  LARGE, INTESTINE, AUERBACH'S PLEXUS, MYENTERIC GANGLIA (6299)*

AZATHIOPRINE
  CHRONIC, HEPATITIS, IMMUNOSUPPRESSIVE (6874)
  CIRRHOSIS, THERAPY (6681)*
BACTERIA
  AEROMONAS HYDROPHILA, ENTERITIS, UNCOOKED, FOOD, TOURISTS (6904)
  CECUM, ANEROBIC, FUSOBACTERIUM, EUBACTERIA, CLOSTRIDIUM (6947)*
  CECUM, FATTY ACID, ANTIBIOTIC, RAT (6512)
  INTESTINAL, BONE MARROW CELL PROLIFERATION (6503)
  INTESTINAL, BONE MARROW CELL PROLIFERATION, AUTORADIOGRAPHY (6504)
  MICROFLORA, GROWTH, X-IRRADIATION, ICR MICE (6932)*
  PROLIFERATION, COLON, ANTIBIOTICS (6930)*
  SALMONELLA, EPIDEMIOLOGY, TYPHOID FEVER, FOOD POISONING (6314)
  SALMONELLA TYPHIMURIUM, INTESTINE, NON-NEOPLASTIC DISEASE (6969)
  TUBERCOLOSIS, ESOPHAGUS, RADIOLOGY (6600)
  TUBERCULOUS ENTERITIS, COLON SURGERY (6987)
BACTERIAL DISEASE
  SALMONELLOSIS, IMMUNOLOGY (6943)*
  SALMONELLOSIS, INTESTINE, IMMUNOLOGY (6944)*
BIGUANIDE
  STEATOSIS, PLASMA, LIPIDS, LIPOPROTEIN (6800)
BILE
  ACETYLCHOLINE, REGULATOR MECHANISM (6416)
  ACID, SALT, LIVER EXCRETION, PERFUSED LIVER (6362)
  BILIRUBIN, FETUS, SHEEP (6456)
  CONJUGATED ACID, GLYCOCHOLIC ACID, 7 ALPHA-DEHYDROXYLATION (6419)*
  IMMUNOGLOBULIN, A, G, M, MONKEY (6939)*
  LIVER, HOMOTRANSPLANT, HOST (6826)
  SPHINCTER OF ODDI, FLOW RESISTANCE, VAGOTOMY (6382)*
BILE ACID
  CONJUGATION, 7 ALPHA-DEHYDROXYLATION, GLYCOCHOLIC ACID (6419)*
  GLYCOCHOLIC ACID, METABOLISM, GASTRECTOMY (6608)*
BILE DUCT
  ENDOSCOPY, GALLSTONES, HEPATOMA (6519)*

  EXTRAHEPATIC BILE DUCT, GALLBLADDER, ADENOMA (6914)
  GALLBLADDER, BIOPSY, JAUNDICE (6575)
  GALLBLADDER, POLYARTERITIS NODOSA (6915)
  INFECTION, TETRACYCLINE, THERAPY, EXCRETION (6922)
  INTRAHEPATIC, ANEURYSMAL DILATION, SURGERY, CHILDREN (6808)
  INTRAHEPATIC, BENIGN, CHOLANGIOMA, HAMARTOMA (6798)
  OBSTRUCTIVE JAUNDICE, LITHIASIS, ULCER, DYSPEPSIA (6547)
  ODDI'S SPHINCTER, MORPHINE, RESIDUAL PRESSURE (6927)
  PYLORIC ANTPUM, ULCER, ECTOPIC JUNCTION (6667)
  STONES, PAPILLARY STENOSIS, CHOLECYSTECTOMY, EMPYEMA (6912)
  TRACHEAL ALLOGRAFT (6917)
BILHARZIASIS
  EPIDEMIOLOGY, PARASITE, METEORISM, HEMATURIA (7008)
BILIARY TRACT

- CHOLEDOCHOTOMY, TRANSDUODENAL ROUTE (6913)
- CHOLESTASIS, ESTROGEN INDUCTION, PREGNANCY (6783)
- PERCUTANEOUS TRANSHEPATIC CHOLANGIOGRAPHY, CARCINOMA, CHOLELITHIASIS (6554)
- PERCUTANEOUS TRANSHEPATIC CHOLANGIOGRAPHY, CONTRAST MEDIA (6556)
- SURGERY, GASTRIC DECOMPRESSION (6646)
- YEASTS, CANDIDA ALBICANS, LAMBLIASIS (6919)

ILIRUBIN
- ALBUMIN, BINDING (6770)*
- CHOLERESIS, CHOLERETICS, SODIUM DEHYDROCHOLATE (6429)*
- CIRRHOSIS, ALBUMIN, ASCITES, PROGNOSIS (6899)
- CONJUGATION, ESTROGEN, BREAST-MILK JAUNDICE (6772)*
- FETUS, SHEEP (6456)
- LIVER FUNCTION, DYE UPTAKE, RIFAMYCIN SV (6454)*

IOPSY
- LIVER, CENTRILOBULAR SINUSOIDAL, CONGESTIVE HEART FAILURE (6929)*
- SUCTION, GASTRITIS, ATROPHIC, SUPERFICIAL, METAPLASIA (6609)

LOOD
- CELL, ULTRASTRUCTURE, ENDOTOXIC, SHOCK (6928)*

LOOD FLOW
- CELIAC ARTERY, SUPERIOR MESENTERIC ARTERY (6611)*
- ILEUM, INTRALUMINAL PRESSURE, ACETYLCHOLINE (6498)*
- MESENTERIC, POST-PRANDIAL (6499)*
- SUPERIOR MESENTERIC ARTERY, ACETYLCHOLINE, VENOUS EFFLUENT (6500)*

LOOD VESSEL
- ABDOMINAL SPLANCHNIC ARTERIES, COMMUNICATION, OCCLUSION (6953)
- HEPATIC ARTERY, ANGIOGRAPHY, PORTAL HYPERTENSION (6526)
- HEPATIC ARTERY, PERFUSION, ANTIMETABOLITES (6852)
- LIVER ARTERIOLES, MICROSCOPY, FUNCTIONAL UNIT (6320)

ONE MARROW
- DEPRESSIONS, VIRAL HEPATITIS, ANATOMOPATHOLOGY, CHILDREN (6056)*

OWEL
- MOTILITY, DROPERIDOL, MUSCLE, FENTANYL (6385)
- SPONTANEOUS PNEUMOPERITONEUM, RESECTION (6974)

ALCIUM
- ABSORPTION, INTESTINE, VITAMIN D3 (6355)*
- ABSORPTION, SECRETION, PARATHYROIDECTOMY (6350)*

ANCER
- COLON, POLYP, RADIOLOGY (6714)
- COLON, RECTUM, ANTIGEN, TUMOR (6694)*
- DUODENUM, DUODENOSCOPY, SCOPIC BIOPSY (6645)
- ESOPHAGUS, BLEOMYCIN (6603)
- ESOPHAGUS, STOMACH, ENDOSCOPY, CYTOLOGY, BIOPSY (6534)
- GASTRIC, GASTRO-FIBERSCOPE, BIOPSY (6545)
- GASTRIC, ULCER (6617)
- ISLET CELL TUMOR, VATER'S PAPILLA, ADENOCARCINOMA (6744)
- LIVER, GLYCOGEN, HISTOCHEMISTRY (6316)
- PRIMARY, LIVER, HEXAMETHYLMELAMINE (6796)
- RECTUM, RECTOSIGMOIDOSCOPY, POLYPS, OCCULT BLOOD (6520)*
- STOMACH, MESENCHYMAL, LYMPHORETICULOSARCOMA, POLYPOID (6655)

CANDIDIASIS
- ESOPHAGITIS, MALIGNANT, CHILDREN (6935)*

CAPILLARY
- PANCREATITIS, VASODILATATION, BRADYKININ, SEROTONIN (6753)

CARBOHYDRATE
- CONGENITAL LACTOSE MALABSORPTION, DUODENUM (6691)
- DISACCHARIDE INTOLERANCE, MALABSORPTION (6690)
- GLUCOSE TRANSPORT, SMALL INTESTINE, O2 AVAILABILITY (6361)
- GLUCOSE, XYLOSE, LIVER MICROSOME, DEHYDROGENASE (6465)
- GLUCOSYLATION, ACCEPTOR-LIPID, DOLICHOL (6307)*
- GLYCOGEN, LIVER, DAB CARCINOGENESIS HISTOCHEMISTRY (6316)
- GLYCOGEN STORAGE DISEASE, GARGOYLISM, LIVER BIOPSY, ENZYMATIC DIAGNOSIS (6531)
- GLYCOGEN SYNTHESIS, INHIBITION, LIVER (6470)
- INTESTINAL TRANSPORT, AMINO ACID (6363)
- LIVER GLYCOGEN, ISOLATION, SODIUM IOTHALAMATE (6331)
- METABOLISM, LIVER, NICOTINAMIDE (6421)*
- SUCROSE, SODIUM CYCLAMATE, SACCHARIN, CARCINOGENESIS (6515)

CARBON TETRACHLORIDE
- POISONING, HEPATIC COLLAGEN (6448)*

CARCINOGEN
- AZO DYE, BASOPHILIA, RNA (6303)*
- M-TOLUYLENEDIAMINE, LIVER, RAT (6827)
- SODIUM CYCLAMATE, SACCHARIN, SUCROSE (6515)

CARCINOGENESIS
- N-HYDROXY-2-ACETYLAMINOFLUORENE SULFOTRANSFERASE, PROTEIN-(METHION-S-YL) BINDING (6433)*

CARCINOMA
- ADRENOCORTICAL, EXTRA-PANCREATIC, HYPOGLYCEMIA, MESODERMAL (6747)
- ANAPLASTIC, INTESTINE, STOMACH, PANCREAS (6970)
- CERVIX UTERI, JAUNDICE, HALOTHANE (6833)*
- DUODENUM, INFRAPAPILLARY, PARATHYROID ADENOMA (6621)
- ESOPHAGEAL, ROTATORY IRRADIATION, PERFORATION, HEMORRHAGE (6580)*

- ESOPHAGUS, BETEL CHEWING, CEYLON (6598)
- GASTRIC, BENIGN POLYP (6622)
- GASTRIC, GASTROCAMERA, MUCOSA (6537)
- GASTRIC, GASTROSCOPY, CYTOLOGY (6546)
- HEPATIC, BILE DUCT, HILUM, SURGERY (6825)
- LARGE BOWEL, MAMMARY, RENAL, CHEMOTHERAPY (6708)
- LIVER, VASCULAR ANATOMY (6322)
- MALIGNANT, AMPULLA OF VATER, VON RECKLINGHAUSEN'S DISEASE (6726)
- PANCREAS, STEATORRHEA, GLUTEN-FREE DIET (6739)
- PRIMARY, LIVER, CIRRHOSIS (6806)
- PRIMARY, LIVER, CIRRHOSIS, JAPAN (6789)
- PRIMARY HEPATIC, ASCITES, JAUNDICE (6828)
- SIGMOID, PERIDIVERTICULITIS, STENOSIS (6703)
- STOMACH, GASTRIC JUICE, LACTIC ACID (6613)*
- STOMACH, OBSTRUCTION, DUODENAL ULCER TUBERCULOSIS (6634)
- STOMACH, RADIATION THERAPY (6625)
- STOMACH, RADIOGRAPHY (6555)
- STOMACH, SURGERY (6629)

CATION
- SODIUM, CALCIUM, MAGNESIUM, ADENYL CYCLASE (6428)*

CECUM
- ANEROBIC, CULTURES, PATHOGEN-FREE MOUSE (6497)*
- BACTERIA, FATTY ACID, ANTIBIOTIC, RAT (6512)
- FIBERCOLONOSCOPE, ILEOCECAL VALVE (6559)
- RECTUM, URINE, ROADRUNNER (6506)

CELIAC DISEASE
- OSTEOMALACIA, DIAGNOSIS (6685)*

CELL
- AUTOPHAGY, ATROPHY, GLYCOGEN (6774)*
- ENDOCRINE, DUODENUM, ULTRASTRUCTURE (6284)*
- LIVER, CHROMATIN, ETHIONINE (6345)
- MUCOUS, PARIETAL, CHIEF (6304)*
- REGENERATION, RECTUM, ULCERATIVE COLITIS, AUTORADIOGRAPHY (6731)*

CHOLANGIOGRAPHY
- BILE DUCTS, GALLBLADDER BIOPSY, JAUNDICE (6575)

CHOLANGIOMA
- CYSTIC, BENIGN, ANGIOGRAPHY, HAMARTOMA (6798)

CHOLECYSTECTOMY
- ANGINA PECTORIS, POST-OPERATIVE, ELECTROCARDIOGRAM (6924)
- CHOLESTEROL STONE, CHOLELITHIASIS
- RESECTION, ADHESIONS, ABSCESS, APPENDECTOMY (6951)

CHOLECYSTITIS
- CHOLELITHIASIS, MALE (6918)

CHOLECYSTO-GASTROSTOMY
- BILE DUCT, ULCER, PYLORIC ANTRUM, CHOLANGIOGRAPHY (6667)

CHOLECYSTOKININ
- PANCREOZYMIN, GASTRIN, HORMONES, OLIGOPEPTIDES (6333)
- STIMULATION, HISTIDINE DECARBOXYLASE, STOMACH, MUCOSA (6397)*
- STOMACH, EMPTYING, SECRETION, EFFECT (6379)*

CHOLECYSTOLITHIASIS
- ANGINA PECTORIS, MYOCARDIAL ISCHEMIA (6924)
- CHOLESTEROL, SODIUM DEHYDROCHOLATE, CLOFIBRATE, CHOLESTYRAMINE (6911)*
- CHOLINESTERASE, PROTEIN METABOLISM (6565)
- METABOLIC DISORDERS, DIABETIC (6923)
- OBSTRUCTIVE JAUNDICE, BILIARY-DUODENAL FISTULA, REFLUX (6547)
- PANCREATITIS, ACUTE, DELIVERY, FATTY NECROSIS (6751)
- SINGLE STONE, MULTIPLE CALCULI, LIVER DAMAGE (6925)
- SURGERY, CHOLECYSTECTOMY, CHOLEDOCHOTOMY (6912)

CHOLERA
- EXOTOXIN, SODIUM FLUXES, CYCLOHEXIMID (6942)*
- ORAL THERAPY, PAKISTAN (6973)
- TOXIN, ELECTROPHORETIC MOBILITY, FORMALIN (6514)
- VIBRIO, ENTEROTOXIN, BIOCHEMISTRY (6513)

CHOLERESIS
- BILIRUBIN, CHOLERETICS, SODIUM DEHYDROCHOLATE (6429)*

CHOLESTEROL
- BIOSYNTHESIS, 3-HYDROXY-3-METHYLGLUTARATE, MEVALONIC ACID (6426)*
- PLASMA, UNSATURATED FAT, DIETARY FACTOR (6352)*
- SYNTHESIS, GALLBLADDER, LIVER, ILEUM, GUINEA PIG (6463)

CHOLINE
- FATTY LIVER, PREVENTION, MYOINOSITOL (6777)*

CHOLINERGIC
- ACETYLCHOLINE, ILEUM, BLOOD (6498)*

CHOLINESTERASE
- LIVER, SERUM, CHOLELITHIASIS (6565)

CHROMATOGRAPHY
- GAS, MASS SPECTOMETRY, STEROIDS (6445)*

CIRCULATION
- ABDOMINAL SPLANCHNIC ARTERIES, COMMUNICATION, OCCLUSION (6953)
- ARTERIOVENOUS SHUNT, STOMACH, DUODEN PANCREAS, O2 CONSUMPTION (6507)
- ATHEROSCLEROSIS, GASTRIC ULCER, GASTRIC CARCINOMA, RADIOLOGY GERIATRICS (6620)
- BLOOD GROUP, CIRRHOSIS, LIVER, ALCOH (6890)
- BLOOD GROUPS, VIRAL, HEPATITIS, CIRRHOSIS (6937)*
- ESOPHAGEAL VARICES, MANAGEMENT (6582
- FIBRINOGEN, HEPATIC SYNTHESIS, HEPAT RELEASE (6455)
- FIBRINOGEN, SYNTHESIS, AMINO ACID, HORMONE, FAST, THROMBIN (6473)
- HEPATIC, FIBROGENESIS, CIRRHOSIS (6395)

- HEPATIC, MEMBRANE TRANSPORT (6377)
- HEPATIC, PORTAL HYPERTENSION (6805)
- HEPATIC, PORTAL-SYSTEMIC SHUNT (6788)
- INTESTINAL ABSORPTION, BLOOD FLOW (6364)

PREFACE

GASTROENTEROLOGY ABSTRACTS and CITATIONS is a publication of the National Institute of Arthritis and Metabolic Diseases. This specialized information medium has been initiated to fill an existing great need in the field of gastroenterology and to assist the Institute in meeting its obligations to foster and support laboratory and clinical research into the nature, causes, and therapy of diseases of the gastrointestinal tract. Publication of GASTROENTEROLOGY ABSTRACTS and CITATIONS makes available citations of all current papers relevant to this field from medical journals published throughout the world. Approximately one-third of the citations dealing with the major aspects of gastroenterology have accompanying abstracts.

The issuing of GASTROENTEROLOGY ABSTRACTS and CITATIONS under the auspices of the National Institute of Arthritis and Metabolic Diseases will provide a much needed current awareness tool to scientists and will facilitate greater integration of research and clinical efforts in this field. The number and great diversity of publications in the area of gastroenterology makes it imperative that an appropriate service be available to investigators and practitioners so that they may be apprised of progress with a minimum of delay. Our aim is to provide the readers with a readily systematized compilation of current published work. The publication will provide the greatest usefulness if these interested investigators will contribute their ideas and comments for consideration whenever possible.

GASTROENTEROLOGY ABSTRACTS and CITATIONS is published monthly and includes citations and abstracts from the biomedical world literature as they are currently received. In addition, yearly cumulated subject and author indexes are published.

This publication is available free to National Institutes of Health grantees and contractors working in the field of gastroenterology and libraries of medical schools. Requests from these qualified individuals to receive free copies of this publication must include their grant or contract number and the title of their project. These requests as well as address changes and other communications should be addressed to:

Scientific Communications Office
Gastroenterology Abstracts and Citations
National Institute of Arthritis and Metabolic Diseases
National Institutes of Health
Bethesda, Maryland 20014

Other individuals and libraries may receive this publication by subscribing *directly* to the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402. Subscription price per year in the United States, Canada, and Mexico, $16.00; foreign, $4.00 additional; and $1.25 for a single copy. Payment is required in advance, and check or money order should be made payable to the Superintendent of Documents.

SGPT	serum glutamic-pyruvic transaminase
U	unit(s)
UV	ultraviolet
WBC	white blood cells (leukocytes), white blood count
yr	year(s)

PRE-CLINICAL SCIENCES

MORPHOLOGY, CELLULAR STRUCTURE AND HISTOCHEMISTRY

7022 ADENOSINE 3'-5'-CYCLIC PHOSPHATE-DEPENDENT AND INDEPENDENT HISTONE KINASES FROM RAT LIVER. *(E.)* Yamamura, H. (Kobe U. Sch. Med., Japan), M. Takeda, A. Kumon and Y. Nishizuka. *Biochem Biophys Res Commun* 40(3):675-682, 1970.

Cyclic AMP dependent and independent histone kinases (protein kinase B_1 and protein kinase B_2, resp.) from rat liver were partially purified and their properties were studied. Following DEAE-Sephadex column chromatography, protein kinase B_1 and B_2 were eluted together as a single peak. When this fraction was chromatographed further on a hydroxylapatite column 2 enzyme peaks appeared. Protein kinase B_1 (first peak) was stimulated greatly by the addition of cyclic AMP, and the maximum stimulation was found at 8×10^{-8}M of the nucleotide; protein kinase B_2 did not respond to the nucleotide. Both protein kinase B_1 and B_2 were relatively specific for histone and reacted with calf thymus, rat liver and chick erythrocyte histones. Acid hydrolysis of each histone phosphorylated under various conditions resulted in the formation of phosphoserine and phosphothreonine in the ratio of more than 9. Histone preparations were phosphorylated by protein kinase B_1, B_2 or both in the presence and absence of cyclic AMP, indicating that both protein kinase B_1 and B_2 incorporate the terminal phosphate of ATP into the same specific seryl and threonyl residues in histone molecules, and that cyclic AMP stimulated only the rate of reaction catalyzed by protein kinase B_1. Both protein kinase B_1 and B_2 showed maximum activities at pH 7.5 in the presence of $2 X 10^{-2}$M Mg^{++}. The enzymes were specific for ATP with a Km value of 4×10^{-6} M, and were irreversibly inhibited 90% by 4×10^{-5} M ADP. Protein kinase B_2 was rather unstable and approximately 50% of the activity was lost upon storage for 2 days at -20°, or heat treatment for 2 min at 50°, while protein kinase B_1 was stable under these conditions.

7023 STUDIES ON INTESTINAL DISACCHARIDASES: IV. HETEROGENEITY OF MONKEY INTESTINAL MALTASES. *(E.)* Swaminathan, N. (Dept. Biochem., St. U. New York, N. Y.) and A. N. Radhakrishnan. *Indian J Biochem* 7(1):19-23, 1970/

The heterogeneity of monkey intestinal maltases was investigated by heat inactivation and ion exchange chromatography. Heat inactivation at 55°C resulted in the loss of 60% of the total maltase activity and an almost complete inactivation of invertase activity; isomaltase activity was also destroyed at this temperature; the inactivation of 55°C unstable maltase (maltase I) was complete at 30 min, and there was no further loss of activity even if heating continued for 1 hr. At 60°C an additional 15% of maltase activity was lost and the remaining maltase activity was destroyed at 65°C. This stepwise heat inactivation suggested the presence of 3 species of maltase activities with different sensitivities to heat: maltase I (55°unstable), maltase II (60° unstable), maltase III (65° unstable). When a papain solubilized preparation was fractionated on a column of Sephadex G-200, a single broad peak of maltase activity appeared. Following DEAE-Sephadex fractionation maltase I was obtained relatively free of maltases II and III, although maltase II and maltase III could not be separated from each other. When the sample solubilized by butanol treatment was chromatographed on DEAE-Sephadex, one maltase peak which coincided with the maltase, invertase and isomaltase activities with a broad shoulder was obtained.

7024 STUDIES ON INTESTINAL DISACCHARIDASES: V. CHARACTERIZATION AND PROPERTIES OF MALTASE FRACTIONS FROM MONKEY INTESTINE. *(E.)* Swaminathan, N. (Dept. Biochem, St. U. New York, N. Y.) and A. N. Radhakrishnan. *Indian J Biochem* 7(1):24-28, 1970.

The kinetic properties of maltase I were investigated and compared with those of the heat stable maltase (maltase III) isolated from monkey intestine. Properties of an altered form of maltase I devoid only of isomaltase activity were also studied. Maltase I acted on maltose, sucrose and isomaltose, the rate decreasing in that order (relative rate: 100, 60, 38, resp.). Altered maltase I (stored at -20°C for 3 months) did not hydrolyse isomaltose, while maltase III did not hydrolyse sucrose or isomaltose. Km values for sucrose and maltase (10.0 and 6.0 mM) using altered maltase I were of the same order showing that the alteration in the property of maltase I was confined to isomaltase activity only. The km value for maltose (0.6 mM) with maltase III was much lower than with the other 2 maltases (12.5 and 6.0 mM). Optimal pH for the hydrolysis of maltose, sucrose and isomaltose by maltose I was about the same (pH 6.0), and maltase III showed a broad optimum between pH 5.5 and 6.5. Sucrose or isomaltose when incubated with maltose, inhibited the hydrolysis of the latter; however, when only sucrose and isomaltose were present, they did not inhibit the hydrolysis of each other. Enzyme activities were sensitive to inhibition by heavy metal ions (Hg^{+2}, Ag^{+}, Cu^{+2}), Tris-maleate buffer (0.1M) and urea (2M).

7025 MORPHOLOGICAL CHANGES OF THE SMALL INTESTINAL MUCOSA OF GUINEA PIG AND HAMSTER FOLLOWING INCUBATION *IN VITRO* AND PERFUSION *IN VIVO* WITH UNCONJUGATED BILE SALTS. *(E.)* Low-Beer, T. S. (Bristol Roy. Infirm., England), R. E. Schneider and W. O. Dobbins. *Gut* 11(6):486-492, 1970.

Morphological changes of the small intestinal mucosa of guinea pig and hamster were studied following incubation *in vitro* and perfusion *in vivo* with unconjugated bile salts (sodium cholate, sodium deoxycholate, sodium chenodeoxycholate). The lesions noted were located exclusively in the upper third of the villi, and they were similar following incubation *in vitro* and perfusion *in vivo*. In both situations, there was excessive shedding of epithelial cells from villous tips, and the desquamated cells, rounded in shape and with increased cytoplasmic eosinophilia, appeared to be similar in control experiments and in those where bile salts was used. The nuclei were pyknotic and showed prominent clumping of nuclear chromatin about their periphery, changes characteristic of cell injury. Generally, no major differences were observed between the proximal and distal small intestine or between the species used except with guinea pig intestine incubated with 5 mM cholate, where less damage was found proximally than distally. In contrast to studies *in vitro*, regional differences were readily demonstrable with perfusion of bile salts *in vivo*. Dihydroxy bile salts produced more marked alterations of both proximal and distal small intestine than the trihydroxy bile salt, sodium cholate. When 5 mM cholate at pH 6.8 was perfused in the guinea pig, absorption occurred approximately 30 times more rapidly from distal than from proximal segments, while in proximal segments 2 mM chenodeoxycholate was absorbed approximately 15 times more rapidly than 5 mM cholate. A correlation may exist between the morphological alteration produced in the region of the small intestine by a bile acid and the amount of bile salt passing through the cell.

7026 EFFECT OF VITAMIN D ON ENZYME ACTIVITIES IN THE MUCOSAL CELLS OF THE CHICK SMALL INTESTINE.

(E.) Holdsworth, E. S. (Biochem. Dept., U. Tasmania, Hobart, Australia). *J Membrane Biol* 3(1):43-53, 1970.

The effect of vitamin D$_3$ (400 IU i.m.) on enzyme activities (acid p-nitrophenyl phosphatase, alkaline p-nitrophenyl phosphatase, pyrophosphatase, adenosine triphosphatase, phosphodiesterase, and adenyl cyclase) in the mucosal cells (homogenates and brush borders) of the duodenum of 4-week-old crossbred cockerels fed a vitamin D-deficient diet was determined. Adenyl cyclase, phosphodiesterase, and acid p-nitrophenyl phosphatase activities were not affected by vitamin D administration, while the activities of the other enzymes doubled after 72 hr. Adenosine triphosphatase (Mg^{++} or Ca^{++} dependent) activity (nmole ATP hydrolyzed/min/mg protein) increased from the levels observed in rachitic chicks (47 to 85 with Mg^{++} and 22 to 45 with Ca^{++}); sodium or potassium ion did not further affect activity. Alkaline phosphatase activity (nmole p-nitrophenylphosphate hydrolyzed/min/mg protein) and pyrophosphatase activity (nmole pyrophosphate hydrolyzed/min/mg protein) increased with vitamin D administration (410 to 600 and 51 to 65, resp.). Mg^{++} (2 mM) and Ca^{++} (5 mM) in combination enhanced alkaline phosphatase activity in vitamin D$_3$-replete chicks (from 834 with Mg^{++} alone or 24 with Ca^{++} alone to 944 with both ions), but the ion effect on pyrophosphatase could not be determined because the Ca^{++} precipitated under the conditions used. The inhibitors ouabain (10^{-3} M) and dicyclohexylcarbodiimide (10^{-4} M) had no effect on the activities, but phlorizin (10^{-3} M) stimulated (20%) and DL-phenylalanine (2×10^{-2} M) inhibited (80%) the activities. Vitamin D$_3$ increased the translocation of ^{45}Ca to serosal fluid 3-fold (68,310 cpm to 196,680 cpm) in the everted chick ileum, and phenylalanine (5×10^{-2} M) did not interfere with the transport.

7027 THE LIPASE OF RAT GASTRIC MUCOSA: A HISTOCHEMICAL DEMONSTRATION OF THE ENZYMATIC ACTIVITY AGAINST A MEDIUM CHAIN TRIGLYCERIDE.

(E.) Barrowman, J. A. (London Hosp. Med. Coll., England) and S. J. Darnton. *Gastroenterology* 59(1):13-21, 1970.

Gastric mucosa from rats with chronic pancreaticobiliary fistulas was examined for the presence of hydrolytic enzymatic activity toward an emulsion of trioctanoin stabilized with sodium taurocholate. No activity could be demonstrated in any part of the gastric mucosa in animals which had access only to glucose-saline. Following 2 ml of olive oil 20 min before death, lipolytic activity was detected in cells found principally in the deeper two-thirds of the glands of the fundic mucosal region, and in the basal zone; all cells showed intense activity against trioctanoin. The reaction product was distributed as granules throughout the entire cytoplasm; the basal and perinuclear regions stained more darkly than the apical region. Neutral lipids or free fatty acids in the lumen of the stomach may stimulate the synthesis or activation of considerable amounts of a lipase within the cells of the gastric glands.

7028 SPECIFICITY OF RAT LIVER NAD SYNTHETASE.

(E.) Mor, G. (Dept. Biol. Chem., Hebrew U. Jerusalem, Israel) and N. Lichtenstein. *FEBS Letters* 9(3):183-185, 1970.

α-N-Alkyl derivatives of glutamine were able to substitute for glutamine in rat liver NAD synthesis, although with less effect. α-N-Dimethyl-L-glutamine was approximately as effective as α-N-ethyl-L-glutamine, but the effect of α,α-N-methyl-propyl-L-glutamine was less pronounced. Carbobenzoxy-L-glutamine did not substitute for glutamine, but inhibited its utilization; NAD synthesis was inhibited by carbobenzoxy-L-asparagine, carbobenzoxy-L-aspartic acid, carbobenzoxy-L-alanine, carbobenzoxy-L-phenylalanine and carbobenzoxy-S-benzyl-L-cysteine, the inhibition by the latter two compounds being the strongest (85% and 95% inhibition, resp.). The corresponding free amino acids did not inhibit NAD synthesis, and the inhibition by carbobenzoxy-L-asparagin was competitive with glutamine, whereas the inhibition by carbobenzoxy-L-phenylalanine was of a mixed type.

7029 SPECIFICITY OF HISTOCHEMICALLY DEMONSTRABLE BILE CANALICULAR PHOSPHATASE ACTIVITIES.

(E.) Sandstrom, B. (Dept. Human Anat. U. Uppsala, Sweden). *Histochemie* 22(4):316-323, 1970.

Bile canalicular phosphatase activities of chicken, rat, cat, and frog livers were studied histochemically following incubation of the liver slices with ATP, ADP, AMP, α,β-glycerophosphate, or thiamine, inosine, cytidine, uridine, or guanosine diphosphate substrates over a pH range of 4.5 to 9.5. Staining intensities were strong or intense with ATP, thiamine pyrophosphate, and any of the nucleoside diphosphates over a wide pH range (6 to 9.5) with maximum intensity at physiological pH. The enzyme activity was stimulated by calcium, magnesium, and manganese ions, insensitive to sodium, potassium, high concentrations of lead, ouabain, uranyl, p-chloromercuribenzoate, N-ethylmaleimide, fluoride, or cysteine, sensitive to ethanol and acetone, and was completely inactive with AMP and phosphoenolpyruvate substrates. The histochemically demonstrable bile canalicular phosphatase is either a single nonspecific enzyme or a group of histochemically inseparable enzymes, which act only on diphosphate bonds.

7030 CHARACTERIZATION OF PORCINE PANCREATIC ISOAMYLASES: CHEMICAL AND PHYSICAL STUDIES.

(E.) Cozzone, P. (Fac. Sci. Marseilles, France), L. Pasero, B. Beaupoil and G. Marchis-Mouren. *Biochim Biophys Acta* 207(3):490-504, 1970.

Chemical and physical characteristics of porcine pancreatic isoamylases (amylase I and II), including a determination of the amino acid contents of each, were investigated. The amino acid content of amylase I and II were similar except that amylase I contained 5 more aspartic acid and asparagine residues (66 to 67) than did amylase II (61 to 62 residues/mole). A mean value of 1.8 -SH groups per molecule of isoamylase was found, no difference appearing in the sulfhydroyl content of amylases I and II; hence 4 disulfide bridges were present in each molecule. Calculated molecular weights were 52,700 to 54,800 for amylase I and 52,400 to 54,400 for amylase II. The N-terminal group of both amylases was apparently blocked by an acetyl group and C-terminal residue analysis with carboxypeptidase A yielded a single C-terminal leucine. The common C-terminal sequence worked out for both isoenzymes was Ile-Val-Tyr-Phe-Leu-COOH. The preparations of purified amylases I and II were homogenous with identical s values (s=3.95 S) and gel electrophoresis analysis of reduced and carboxymethylated amylases gave a single band pattern. Amylase I and II appeared to behave as single-chain monomeric enzymes.

7031 INDIGOGENIC METHODS FOR GLYCOSIDASES: I. AN IMPROVED METHOD FOR β-D-GLUCO-IDASE AND ITS APPLICATION TO LOCALIZATION STUDIES F INTESTINAL AND RENAL ENZYMES.

(E.) Lojda, Z. Med. Fac. Charles U., Prague, Czechoslovakia). *istochemie* 22(4):347-361, 1970.

sing 5-bromo-4-chloro-3-indoyl-β-D-glucoside as he substrate, the indigogenic method (Pearson, ndrews, and Grose) of histochemical detection of -D-glucosidase in duodenum, jejunum, ileum, kidey, liver, and spleen of rats and in human jejuum (from peroral biopsy specimens) was evaluated nd improved. With the addition of horseradish eroxidase (0.5 to 1 mg/ml), the diffusion artiacts observed with the original method for loalizing the glycosidases were reduced, but with he addition of a ferri-ferrocyanide mixture (3.1 10^{-3} to 4 x 10^{-4} M) the artifact problem disapeared, the staining was confined to enterocytes, nd the deposition of indigo was linear for 3 hr f incubation. In a medium of 0.1 M citrate phoshate buffer at pH 5.5, the glucoside substrate 8 x 10^{-4} M) and the ferri-ferrocyanide mixture 3.1 x 10^{-3} M) gave the best results with a clear rush border localization. The greatest activity as observed in the jejunum, then the duodenum, he ileum, the kidney, and no reaction was seen n the liver. Inhibitors of the system included hlorizin (5 x 10^{-3} M), galactonolactone (5 x 10^{-3}), gluconolactone (4 x 10^{-4} M), cellobiose (8 x 0^{-2} M), lactose (8 x 10^{-2} M), and glucose (8 x 0^{-2} M), while trehalose and sucrose (8 x 10^{-2} M) id not affect the indigo deposition.

7032 SYNTHETIC 1-THIO-β-D-GLUCOSIDURONIC ACIDS AS SUBSTRATES FOR RAT-LIVER β-GLUCURONIDASE.

(E.) Hetu, C. (Dept. Biochem., U. Montreal, Quebec, Canada) and R. Gianetto. *Canad J Biochem* 48(7):799-804, 1970.

Synthetic phenyl 1-thio-β-D-glucosid)uronate, sodium (2-benzothiazolyl 1-thio-β-D-glucosid) uronate, and sodium (*p*-nitrophenyl 1-thio-β-D-glucosid)-uronate were used to study the hydrolysis of 1-thio-β-D-glucosiduronic acids by rat liver. The β-D-glucuronides of 2-benzothiazolethiol and *p*-nitrothiophenol were hydrolyzed by the rat liver preparation, but the β-D-glucuronide of thiophenol was not hydrolyzed. Partial purification of the enzyme from a lysosomal preparation using ammonium sulfate fractionation, gel filtration on a molecular sieve, and anion-exchange chromatography showed that β-glucuronidase was the enzyme responsible for the hydrolysis of these thioglucuronides. Using the partially purified β-glucuronidase, a wide pH optimum around 4.4 was obtained for the hydrolysis of the glucuronide of 2-benzothiazolethiol, while a sharper pH optimum at 5.0 was observed with the glucuronide of *p*-nitrothiophenol. With the same enzyme preparation, a K_m of 6.3 x 10^{-5}M was found for the hydrolysis of the glucuronide of 2-benzothiazolethiol; and a K_m value of 3.1 x 10^{-3}M was obtained for the glucuronide of *p*-nitrothiophenol.

7033 SUBCELLULAR PARTICLES IN TUMORS: III. PEROXISOMAL ENZYMES IN HEPATOMA HC AND MORRIS HEPATOMAS 7794A, 7794B, 5123A AND 7316A.

(E.) Wattiaux, R. (Lab. Physiol. Chem., Fac. U. Notre Dame de la Paix, Namur, Belgium), S. Wattiaux-De Conick, J. M. Van Dijck and H. P. Morris. *Europ J Cancer* 6(3):261-268, 1970.

Activities of catalase, D-amino acid oxidase and urate oxidase were measured in hepatoma HC (rapid growing) and four Morris hepatomas (medium to slow growing) and compared with those found in the normal rat liver. D-amino acid oxidase and urate oxidase were absent in hepatoma HC, but catalase (22 U/100 mg protein) was as active as in normal rat liver. Hepatomas 7316A and 7794B exhibited the following activities; D-amino acid oxidase (0.53 and 0.29 U/100 mg protein, resp., vs 0.21 U/100 mg protein for normal rat liver), urate oxidase (0.93 and 1.34 U/100 mg protein, resp., vs 1.40 U/100 mg protein for rat liver), and catalase (18.9 and 9.7 U/100 mg protein, resp.). In hepatoma 5123A, activities of D-amino acid oxidase and urate oxidase were 0.53 and 0.93 U/100 mg protein, while catalase reached only 15% of the activity in rat liver. Hepatoma 7794A was characterized by high catalase activity (25 U/100 mg protein); D-amino acid oxidase was weakly active, and urate oxidase was not measurable. Catalase showed the phenomenon of latency with Triton X-100 in homogenates of all hepatomas, except 7794A, where both catalase and D-amino acid oxidase were present in the soluble fraction. Using differential centrifugation, in hepatomas 7316A, 7794B, 5123A, and HC, enzymes were mainly recovered in mitochondrial fractions and exhibited a peak of activity in the light one. With isopycnic centrifugation, catalase, D-amino acid oxidase and urate oxidase of hepatomas 7316A, 7794B, and 5123A exhibited similar distribution patterns. Catalase and D-amino acid oxidase of hepatoma 7794A were apparently solubilized during the homogenate preparation due to an extreme fragility of its peroxisomes or else there are very few peroxisomes in the tumor and catalase and D-amino oxidase are mainly found in the free form.

7034 SCANNING AND TRANSMISSION ELECTRON MICROSCOPIC STUDIES OF HUMAN INTESTINAL MUCOSA.

(E.) Toner, P. G. (U. Glasgow Western Infirm., Scotland), K. E. Carr, A. Ferguson and C. MacKay. *Gut* 11(6):471-481, 1970.

Surgical biopsies and postmortem specimens of the small intestine were examined using scanning and transmission electron microscopy. Features of a typical low magnification scanning electron micrograph included surface creases on villi, goblet cell mouths, and occasional intestinal crypt mouths opening between villi. At higher magnification, hexagonal patterns formed by the closely packed apical surfaces of the columnar cells could be seen. Dewaxed paraffin sections showed interconnecting intercellular spaces between the columnar cell bases, and at the free border of the epithelial cells there was a zone which corresponded to the striated border. In an autolysed section under low magnification, the villous cores were more angular and twisted, and in some cases appeared collapsed or flattened. The surface of the autolysed villi was continuous as if covered by an external layer or basement membrane spread over the collagen fiber scaffolding which was the main surviving structure. Transmission electron microscopy of autolysed post-mortem specimens showed groups of identifiable collagen fibers which still displayed their characteristic periodicity and which were accompanied by deposits of fine, non-specific fibrillar material and areas of amorphous debris.

7035 PURIFICATION AND PROPERTIES OF 5-HYDROXYTRYPTOPHAN DECARBOXYLASE FROM MONKEY SMALL INTESTINE.

(E.) Murali, D. K. (Christian Med. Coll. Hosp., Vellore, India) and A. N. Radhakrishnan. *Indian J Biochem* 7(1):13-18, 1970.

The purification and properties of 5-hydroxytryptophan decarboxylase from monkey small intestine were investigated. The rate of decarboxylation was linear with time and was proportional to enzyme concentration over a 3-fold range of protein, 20-60 µg. A 15 min preincubation at pH 8 with pyridoxal phosphate was necessary for optimal rates; the optimum substrate concentration of 5-hydroxytryptophan was 5 mM ($K_m = 1.1 \times 10^{-3}$ M). The enzyme was 84% resolved with respect to the coenzyme, and a definite requirement for pyridoxal phosphate was shown ($K_m = 6.7 \times 10^{-6}$ M). The purified enzyme showed no requirement for a metal ion. The most active substrate was 3,4-dihydroxyphenylalanine followed by 5-hydroxytryptophan and tryptophan (18,100, 7,250, 1,205 U/mg protein, resp.). Activity towards tyrosine, phenylalanine and histidine was extremely feeble; the alteration of the purification factor in the case of phenylalanine and histidine (12.0 and 4.5 as compared to 20.5 for tryptophan) suggesting that those were not substrates for the enzyme. The decarboxylase was inhibited by α-methyl Dopa (60%), p-bromo-m-hydroxybenzyloxamine (70%), and p-hydroxymercuribenzoate (94%). Hydroxymercuribenzoate (10^{-5} M) severely inhibited (94%) the decarboxylase activity, and this inhibition was reversed by β-mercaptoethanol (21%) or glutathione (10%). L-aspartic and L-glutamic acids also inhibited decarboxylase activity (24 and 25% relative activities) and pyridoxal phosphate reversed this effect (108 and 72%). α-Keto acids showed no activation, but in the presence of pyridoxal phosphate showed some potentiation of activity.

7036 STAINING METHODS AND HISTOCHEMISTRY OF NORMA GASTRIC MUCIN.

(E.) Johansen, Aa. (Bispebjerg Hosp., Copenhagen, Denmark) *Acta Path Microbiol Scand* (suppl. 212):57-67, 1970.

Common staining reactions of the mucoid cells of the stomach were investigated and the composition of the various mucosubstances in the stomach was determined histochemically. The reactions were strongest in the cetyl pyridinium chloride formalin-fixed preparations, but were most well defined in the acetic-alcohol-formalin-fixed preparations. A very slight and inconstant reaction at the bottom of foveola and in the mucous neck cells was found with 10% mucicarmine solution. Best's carmine was stongly positive in all mucoid cells (surface epithelium, the crypt epithelium in the corpus fundus and pars pylorica, the pyloric glands, the mucous neck cells, and Brunner's glands), but negative in the goblet cells. These cells were all PAS positive, but only the deep gastric foveolar cells, the mucous neck cells and a few ducts from the Brunner's glands were slightly and inconstantly colored with Alcian blue and constantly colored with the colloidal iron reaction. Histochemically, the mucin elements appear to consist predominantly of neutral mucosubstances and the cells reacting with colloidal iron apparently contain mainly neuraminic acid, and moderate quantities of sulfated mucopolysaccharides.

7037 AUTORADIOGRAPHIC METHODS IN ENZYME CYTOCHEMISTRY: IV. THE CELLULAR AND ULTRASTRUCTURAL LOCALIZATION OF ORGANOPHOSPHATE-SENSITIVE ESTERASES IN MOUSE LIVER AND KIDNEY.

(E.) Barnard, E. A. (Dept. Biochem., State U., New York, Buffalo), G. C. Budd and K. Ostrowski. *Exp Cell Res* 60(3):405-418, 1970.

Organophosphate-sensitive esterases of mouse liver and kidney were localized on a cellular and ultrastructural basis (using labeled ^{3}H-diisopropylphosphorofluoridate and electron microscope autoradiography) mainly in the proximal tubule cells of the kidney and parenchymal hepatocytes. Use of protective substrates and inhibitors such as acetyl-β-methylcholine, phenyl acetate plus acetylsalicylic acid, benzoyl-L-arginine ethyl ester, α-acrylylproprionic acid, and eserine with the ^{3}H-diisopropylphosphorofluoridate showed that most of esterase was the relatively nonspecific carboxylesterase type, with small amounts of cholinesterases and more specific carboxylesterase. Electron microscope autoradiography showed in both liver and kidney tissues hat cytoplasmic locations of these esterases are embrane-bound sites, especially in the endoplasmic eticulum. Lysosomes did not contain these organophosphate-sensitive esterases; nuclei in kidney ubule cells, but not those in liver cells, seemed o contain much of these esterases. The concentration increased with autolysis, but the increase may ave been due to translocation from cytoplasmic sites.

7054 EFFECT OF LYSINE AND THREONINE SUPPLEMENTATION ON DIGESTION AND ABSORPTION OF WHEAT PROTEIN.

(E.) Fukui, T. (Sch. Med. Tokushima U., Japan), T. Miyoshi, H. Fukui, F. Tomiyoshi, H. Nakata, K. Matsuura, K. Niki, H. Kinoshita and T. Morioka. *Tokushima J Exp Med* 16(3-4):177-181, 1970.

The effect of lysine and threonine supplementation of wheat protein on digestion and absorption of protein in 2 female dogs was evaluated by fecal nitrogen determinations. Dog A was fed the lysine (0.8 g) and threonine (0.2 g) supplemented diet for 40 days, the last 5 days of which food intake was measured and feces were inspected daily. Then dog A was fed the basal diet for 40 days and 3 days after changing the diet, food intake and feces were measured for 4 days and also during the last 6 days of the basal diet. The above feeding program was reversed for dog B. During basal diet feeding, dog A showed a depression in food intake (800 g) and an increase of feces and nitrogen excretion (902, 4.12 g, resp.) compared to 1000 g food intake and a decrease in feces and nitrogen excretion (462, 3.78 g, resp.) during the lysine and threonine supplemented diet. The rate of nitrogen absorption was greater during the supplemented diet (81%) than the basal diet (73%), and the body weight gain (41g/day) and amount of absorbed protein (19 g/day) was also greater during the supplemented diet. Dog B showed good appetite, increase in food intake and increased rate of nitrogen absorption (1100 g, 83%) during the lysine and threonine-supplemented diet when compared to the basal diet (500 g, 78%). Not only the efficiency of protein synthesis in the body, but also the rate of digestion and the absorption of protein seemed to be improved by supplementing wheat protein with lysine and threonine.

7055 VITAMIN D DEFICIENCY AND NEUTRAL AMINO ACID ABSORPTION IN THE RAT INTESTINE.

(E.) Younoszai, M. K. (Dept. Intern. Med., U. Iowa, Iowa City) and H. P. Schedl. *Proc Soc Exp Biol Med* 134(2):562-565, 1970.

The effect of vitamin D deficiency on neutral amino acid (α-aminoisobutyric acid) absorption in the rat intestine *in vivo* was investigated. α-Aminoisobutyric acid blood concentrations, tissue concentrations and final concentrations in the perfusing solutions were the same in the depleted and repleted rats. The concentration gradient between perfusate, mucosa, underlying tissue and plasma favored absorption in the single-pass perfusion experiment, whereas in the recirculation experiment the concentration gradient was slightly uphill between perfusing fluid and the intestinal mucosa. Vitamin D had no effect on neutral amino acid absorption.

7056 TRANSPORT OF PENICILLAMINE ACROSS MUCOSA OF THE RAT SMALL INTESTINE *IN VITRO*. *(E.)*

Wass, M. (Chelsea Coll. Sci. Tech., London, England), and D. F. Evered. *Biochem Pharmacol* 19(4):1287-1295, 1970.

L-Penicillamine was transported against a concentration gradient across the rat small intestine *in vitro*, while under similar conditions D-penicillamine was not transported. The mechanism of this transport of L-penicillamine was energy-dependant, (as indicated by the inhibition of transport by cyanide) and not affected by pyridoxine pretreatment. The active transport was considerably inhibited, or completely abolished by equimolar L-methionine or L-valine, as well as by a small decrease in pH below the physiological value, indicating that L-penicillamine shares a transport pathway of the neutral amino acids. D-Penicillamine stimulated the transport of cysteine while the L-isomer had a slight inhibitory effect. In tissue uptake studies with an incubation period of 4 min, the L-isomer was taken up more rapidly than the D-isomer, but with little evidence of saturation with increasing concentration. The effect of both penicillamine isomers on the transport of water by the everted intestinal sacs was of the same order of magnitude as that reported to occur in the presence of other amino acids.

7057 STEROIDS IN GERMFREE AND CONVENTIONAL RATS: DISTRIBUTION AND EXCRETION OF LABELED PREGNENOLONE AND CORTICOSTERONE IN MALE AND FEMALE RATS.

(E.) Eriksson, H. (Karolinska Inst., Stockholm, Sweden) and J. A. Gustafsson. *Europ J Biochem* 15(1):132-139, 1970.

The distribution and excretion of intraperitoneally administered steroids were studied in male and female germfree and normal rats at different times after injection of the isotopes. Two hr after the i.p. administration of 4-^{14}C-pregnenolone and 1,2-^{3}H-corticosterone, 60-70% of the given dose was localized in the small bowel, mainly as the monosulfate. The total recovery of radioactivity from feces and urine was approximately 80% for 4-^{14}C-pregnenolone and 70% for 1,2-^{3}H-corticosterone. The rate of disappearance of radioactivity from the liver and intestinal tract was more rapid in males than in females, and all female rats excreted more monosulfates than free steroids whereas no conjugated steroids were detected in male urine. In feces the ratios between conjugated monosulfates (and disulfates) and free steroids were as follows: pregnenolone experiment - germfree males, 0.45, females, 2.0; normal males, 0.09, females, 0.70: corticosterone experiment - germfree males, 0.58, females, 7.2; normal males, 0.38, females, 1.0. The conjugated metabolites were mainly monosulfated and to a lesser extent disulfated; no steroid glucuronides were found. Conjugated pregnenolone and corticosterone content was 3-fold greater than free steroids in germfree female rats compared to normal rats. Corticosterone metabolites were monosulfated to a larger extent than pregnenolone metabolites; fecal excretion of corticosterone metabolites was quantitatively more important than that of pregnenolone metabolites.

7058 PERMEABILITY OF THE SMALL INTESTINE TO SUBSTANCES OF DIFFERENT MOLECULAR WEIGHT.

(E.) Loehry, C. A. (St. Thomas Hosp., London, England), A. T. R. Axon, P. J. Hilton, R. C. Hider and B. Creamer. *Gut* 11(6):466-470, 1970.

The permeability of the rabbit jejunum was studied in an attempt to correlate molecular weight of water-soluble substances with plasma clearance ratios. Albino rabbits (2 kg) were prepared for infusion and collection by cannulation of the external jugular vein and carotid artery under pentobarbital anesthesia and the jejunum was perfused at a constant rate of 600 ml/hr with physiological saline. The plasma concentration of urea was linear with the urea excreted by the bowel. The urea clearance (ml/min) was 1.8, whereas that of fructose was 0.31 and inulin 0.028, indicating higher clearance for small molecular weight substances. The plasma to lumen and lumen to plasma permeability of fractionated polyvinylpyrrolidone (8,000 to 80,000 molecular weight) was also studied using ^{125}I-polyvinylpyrrolidone. The clearance rates of the polymer molecules were inversely proportional to their respective molecular weights and the permeability pattern appeared almost identical in either direction.

7059 INTESTINAL Ca-TRANSPORT IN EXPERIMENTAL UREMIA. *(Ger.)* Ritz, E. (Med. U. Clin. Heidelberg, Germany). *Z Ges Exp Med* 152(4):313-324, 1970.

The relation between the intestinal Ca-transport disturbance during experimental uremia and during vitamin D-deficiency was investigated in male rats weighing 100 g and fed the "Altromin-diet" (1370 mg Ca, 100 IU vitamin D/100 g). Uremia was produced by total resection of the right and partial resection of the left kidney (the control animals were sham-operated), and the experiments were carried out 120 hr after the nephrectomy. The transport of Ca and PO_4 across the walls of duodenal loops of uremic rats was 25% less than that of controls while sodium transport remained unchanged; dialysis of the peritoneal cavity normalized the rate of transport. Impairment of Ca-transport was noted at concentrations between 0.04 and 10 mM, and the transport of i.v. administered Ca^{47} from the vascular system to the duodenal lumen was slightly but not significantly reduced. Transport rates were neither changed by significant elevation of serum urea levels (due to administration of urea in drinking water), nor by NH_4Cl-induced acidosis; p.o. phosphate load diminished the transport rate. In experiments using isolated duodenal loops and oxygen atmosphere, the oxygen dependent accumulation of Ca and the Ca-transport against a gradient were shown to be impaired. Measurement of Ca^{47} activity in mucosal and serosal layers, as well as autoradiographs demonstrated diminished Ca uptake, and the reduced gradient between content of duodenal loops and incubation fluid containing Ca^{47} was not normalized by peritoneal dialysis prior to the removal of the duodenal loops, although the serum urea levels became normal. Changes of intestinal transport of Ca in uremia closely resemble those seen in vitamin D deficiency.

7060 PERFUSION OF THE CANINE COLON WITH UNCONJUGATED BILE ACIDS. *(E.)* Mekhjian, H. S. (Dept. Intern. Med., Ohio St. U., Columbus) and S. F. Phillips. *Gastroenterology* 59(1):120-129, 1970.

Absorption of sodium, potassium, chloride, bicarbonate, and water from isotonic electrolyte solutions perfused through intact colons of 23 healthy dogs was studied with and without the addition of unconjugated bile acids (deoxycholic, chenodeoxycholic, and cholic acids). Each dog was its own control and mean values were obtained for the absorption (μEq/min) of sodium (81), potassium (8), chloride (64), and bicarbonate (20), and for water absorption (0.55 ml/min). When deoxycholic and chenodeoxycholic acids were added to the perfusate (10 mM) absorption of sodium (12 and 21, resp.), chloride (15 and 13, resp.), bicarbonate (6 and 3, resp.), and water (0.17 and 0.20, resp.) was reduced, while the absorption of potassium (9 and 11, resp.) was not affected; cholic acid (10 mM) did not alter either electrolyte or water absorption. Deoxycholic acid at 5 mM reduced sodium (16), chloride (12), bicarbonate (7), and water (0.13) absorption, and taurodeoxycholic acid (10 mM) inhibited sodium, potassium, bicarbonate, and water absorption (30, 19, 9, and 0.23, resp.). The inhibitory effect of deoxycholic acid (10 mM) was reversible within 30 to 60 min after removing it from the perfusate. Deoxycholic and chenodeoxycholic acids were absorbed from the large intestine (16.7 and 18.7% of the perfused amount, resp.) to a greater degree than cholic acid (7.3%). Light and electron microscopy of the colon revealed only a depletion of mucus from the goblet cells after perfusion with all the bile acids, and no morphological changes were observed.

7061 THE EFFECT OF SKF 525A ON THE DISTRIBUTION OF CARBON TETRACHLORIDE IN RATS. *(E.)* Marchand, C. (Fac. Med. U. Montreal, Quebec, Canada), S. McLean and G. L. Plaa. *J Pharmacol Exp Ther* 174(2):232-238, 1970.

The effect of SKF 525A (40 mg/kg i.p.) on the distribution of $^{14}CCl_4$ (2 ml/kg) administered via gavage to rats 40 min after SKF 525 A administration was studied. In rats pretreated with SKF 525A and sacrificed 30 min, 1 and 2 hr after $^{14}CCl_4$ administration, significantly less toluene-soluble ^{14}C was present in the blood, liver, brain, muscle and fatty tissue. No significant difference in absorption was observed 5.5 hr after gavage, but an increase in tissue ^{14}C was found 12 hr after gavage in rats pretreated with SKF 525A. During the first 6 hr that followed $^{14}CCl_4$ gavage, rats pretreated with SKF 525A excreted less toluene-soluble ^{14}C through the lungs. When the pretreatment was performed 66 hr before administration of $^{14}CCl_4$, there was a significant increase in blood $^{14}CCl_4$ of pretreated rats. When CCl_4 was administered i.p. or s.c., SKF 525A had no apparent effect on CCl_4 in rats sacrificed 1 hr after $^{14}CCl_4$ administration. SKF 525A seemed to have a diphasic effect on the gastrointestinal absorption of CCl_4.

7062 ALTERED ABSORPTION OF DRUGS FROM THE RAT SMALL INTESTINE BY CARBONIC ANHYDRASE INHIBITION. *(E.)* Miya, T. S. (Purdue U. Sch. Pharm. Pharmacol., Lafayette, Ind.) and R. C. Schnell. *J Pharmacol Exp Ther* 174(2):177-184, 1970.

Rats pretreated with acetazolamide (50 mg/kg s.c.) were used to study the absorption of ^{14}C-dextroamphetamine sulfate, ^{14}C-salicylic acid and ^{14}C-urea from *in vivo* duodenal or ileal loops. Carbonic anhydrase found in the ileum and duodenum was completely inhibited by acetazolamide *in vivo*. In the ileal loops d-amphetamine absorption decreased after acetazolamide (652 vs 798 dpm/ml blood after 30 min), and that of salicylic acid was increased (7119 vs 5866 dpm/ml) while that of urea was unchanged (1778 vs 1894 dpm/ml). The pH of the ileal contents was more acidic after acetazolamide pretreatment, and plasma levels generally reflected the absorption of the respective compound. In the duodenum the absorption of d-amphetamine was increased with acetazolamide (763 vs 654 dpm/ml blood after 30 min), that of salicylic acid decreased (6160 vs 6416 dpm/ml) and that of urea remained unchanged (2032 vs 1908 dpm/ml). The pH levels of the duodenal contents were not changed by acetazolamide, and tissue binding of each drug within the two intestinal tissues did not differ after acetazolamide. The differential absorption pattern of the acidic and basic drug from duodenal and ileal sites suggested that the alterations in absorption were secondary physiologic changes resulting from carbonic anhydrase inhibition.

7063 COMPARISON OF FECAL UROBILINOGEN EXCRETION WITH BILIRUBIN PRODUCTION IN NORMAL VOLUNTEERS AND PATIENTS WITH INCREASED BILIRUBIN PRODUCTION. *(E.)*

Bloomer, J. R. (Natl. Cancer Inst., Natl. Inst. Hlth., Bethesda, Md.), P. D. Berk, R. B. Howe, J. G. Waggoner and N. I. Berlin. *Clin Chim Acta* 29(3):463-471, 1970.

An analysis of the plasma disappearance curve of unconjugated ^{14}C-bilirubin in 13 healthy volunteers and 12 patients with a reduction in the red blood cell ^{51}Cr half-life and/or increased bilirubin production was used to determine the amount of bilirubin produced daily. The fraction of the daily bilirubin production excreted in the feces as urobilinogen was also determined by a simultaneous measurement of fecal urobilinogen excretion. In the normal volunteers the average daily fecal urobilinogen excretion was 127 mg (range 47 to 276 mg). An average of 92% of the injected isotope was recovered in the feces, indicating that bilirubin and its degradation products are excreted almost exclusively in the feces, although only 50% of the daily bilirubin production was recovered as fecal urobilinogen. No significant difference was found between the normal individuals and patients with increased bilirubin production for the fraction of daily bilirubin production recovered as fecal urobilinogen or for the fraction of the injected isotope recovered in the stool.

7064 MEASUREMENT OF ELECTRICAL POTENTIALS OF THE HUMAN RECTUM AND PELVIC COLON IN NORMAL AND ALDOSTERONE-TREATED PATIENTS. *(E.)*

Edmonds, C. J. (U. Coll. Hosp. Med. Sch., London, England) and R. C. Godfrey. *Gut* 11(4):330-337, 1970.

A simple and rapid method was described for the measurement of electrical potentials of the human rectum and pelvic colon in normal and aldosterone-treated patients during routine sigmoidoscopy. The potential differences measured had a mean value of 25 mV (range 4-51mV) in 27 subjects with normal bowel, and 6 hr after 2 i.v. injections of 0.5 mg aldosterone, the potential difference had risen to 60 mV (range 37-101 mV). The time course of responses studied after a single injection of aldosterone showed that the potential difference was similar to normal values at 2 hr (30 mV), but after 4 hr the potential difference was significantly higher (40 mV), and the effect disappeared by 18 hr. Urinary sodium concentrations and sodium/potassium ratios fell after aldosterone injections, the time course of the changes being similar to that of the potential differences of the colon. Sodium concentration of the stool fluid also fell; the concentration of chloride in the stool fluid (normal 18; aldosterone-treated 15 mEq/l) was consistent with a passive distribution of chloride according to the electrochemical gradient, but that of potassium (normal 87; aldosterone-treated 112 mEq/l) was considerably greater than expected from a passive distribution, suggesting that potassium is actively secreted into the lumen of the colon.

7065 LIPOLYSIS AND LIPID ABSORPTION IN THE STOMACH OF THE SUCKLING RAT. *(E.)*

Helander, H. F. (Dept. Anat., U. Umea, Sweden) and T. Olivecrona. *Gastroenterology* 59(1):22-35, 1970.

Lipolysis and lipid absorption in the stomach of the suckling rat were investigated with morphological and biochemical techniques. Triglycerides constituted about 85% (59 μmole/gm) of the lipids in fresh rat milk but only about 50% (127 μmoles/gm) in the gastric contents of suckling rats. In contrast, the concentrations of diglycerides and free fatty acids were higher in gastric contents (93 and 95 μmole/g, resp.) than in fresh milk (2.8 and 0.3 μmole/g, resp.). About 25% of the fatty acids in rat milk were of medium chain length; no fatty acids shorter than 8 carbon atoms were found. Gastric lipolysis preferentially liberated medium chain fatty acids and long chain diglycerides. The proportion of various lipids in the gastric wall suggeste a fairly indiscriminate uptake of lipid from the gastric contents, but there was no clear morphological evidence for pinocytotic uptake of gastric contents. Many of the surface epithelial cells in the nonfasted rats contained numerous round or slightly oval globules, moderately dense and varying in size (0.5-5μ), mainly concentrated at the perinuclear and infranuclear regions of the cytoplasm. At the periphery of the globules, there were usually several round, electron lucid regions of varying size, which were stippled by dense particles, about 50-100 Å in size. Digestion and absorption of dietary fat in the stomach probably involves a different process than in the small intestine.

7066 DIGESTION OF HEAT-DAMAGED EGG ALBUMEN BY THE RAT. *(E.)*

Valle-Riestra, J. (Grad. Sch. Nutr., Cornell U., Ithaca, N. Y.) and R. H. Barnes. *J Nutr* 100(8):873-882, 1970.

The course of digestion of heat-damaged proteins (particularly lysine) was studied in rats. Laying hens were injected with 50 μC of ^{14}C-L-lysine within

30 min after laying of an egg and the first egg laid following injection was collected, the egg white separated, dialyzed and available lysine measured after autoclaving at 120° for 1 hr with or without glucose to obtain a Maillard reaction protein or a heat-damaged carbohydrate-free protein. Rats were fed either of the 2 preparations and recovery measured in the intestine, expired air, urine and feces. Large recovery was noted in the small intestine and cecum 2, 7 and 16 hr post-feeding. Higher recovery from air and urine was noted up to 16 hr in rats fed the glucose-free heated protein compared to animals receiving the Maillard protein but greater recovery was found after 16 hr in the Maillard animals, suggesting that lysine or a derivative was absorbed in a non-utilizable form and excreted in urine. From fecal determinations, it appears that no absorption of lysine occurred in the cecum and colon. Severe heating reduces lysine absorbability and heating in the presence of glucose (Maillard complex) further decreases its absorption and excretion.

7067 STRUCTURAL CHANGES IN THE SMALL INTESTINE ASSOCIATED WITH THE UPTAKE OF POLYVINYLPYRROLIDONE BY THE YOUNG FERRET, RABBIT, GUINEA PIG, CAT AND CHICKEN.

(E.) Clarke, R. M. (Physiol. Lab. U. Cambridge, England) and R. N. Hardy. *J Physiol* 209(3):669-687, 1970.

The absorption of ^{125}I-polyvinylpyrrolidone into the epithelial cells of the small intestine was measured with respect to the longitudinal distribution of uptake along the intestine and to structural changes in the intestines with age of newborn ferrets, guinea pigs, rabbits, cats, and chicks. In the ferret, polyvinylpyrrolidone was absorbed readily until 33-34 days after birth, and then ceased to be absorbed at 40-45 days; the uptake that had initially been distributed over the length of the intestine became limited to the distal section before it stopped. In the guinea pig, uptake occurred during the first 48 hr after birth and was limited to the terminal ileum while in the rabbit, uptake continued for 20-22 days after birth and occurred over the distal two-thirds of the small intestine. Considerable variation in uptake was observed in cats (possibly due to differences in maternal attention) lasting from 2-14 days and spread over the distal two-thirds of the intestine, and no uptake was observed in chicks. Histologically, the presence of vacuoles in the epithelial cells of the villus seemed to be associated with the polyvinylpyrrolidone uptake in all the species examined.

7068 RIBOFLAVIN ABSORPTION AND EXCRETION IN THE NEONATE.

(E.) Levy, G. (Sch. Pharm., St. U. New York, Buffalo), W. J. Jusko, N. Khanna, L. Stern and S. J. Yaffe. *Pediatrics* 45(6):945-949, 1970.

The absorption and excretion of riboflavin, a vitamin which is absorbed in adults by a saturable transport process in the proximal small intestine, was investigated in 4 healthy, 5-day-old infants. After p.o. administration of a saturation dose of the vitamin (150 mg/m^2), the urinary recoveries were similar (6 to 7.5%) to those obtained previously in 3- to 6-month-old infants (6 to 8%). However, the maximum urinary excretion rate in the older subjects was 5 times higher than in the neonates (0.25 and .05 μg/min/mg, resp.) and the duration of the maximum rate was much longer in the neonates (15 hr vs 1 hr) than in the older children. The maximum excretion rate of riboflavin in the neonate after parenteral injection was higher than after p.o. administration of the vitamin. The slow and prolonged excretion of riboflavin by the neonate after p.o. administration seemingly is due to prolonged absorption from the gastrointestinal tract rather than to a limited renal excretory capacity and the human neonate is probably quite capable of absorbing riboflavin from the gastrointestinal tract, despite an apparently immature specialized intestinal transport mechanism.

7069 EFFECT OF RENAL INSUFFICIENCY ON THE ACTIVE TRANSPORT OF CALCIUM BY THE SMALL INTESTINE.

(E.) Baerg, R. D. (Columbia U. Coll. Physicians Surgeons, New York, N.Y.), D. V. Kimberg and E. Gershon. *J Clin Invest* 49(6):1288-1300, 1970.

The effect of experimentally-induced renal insufficiency on active transport of calcium by the small intestine was studied in everted duodenal gut sacs of Sherman rats. Active transport of calcium in gut sacs of partially nephrectomized rats was significantly decreased when compared to sham-operated controls (inside/outside ratio 6.5 in controls vs 4.3). Similar studies performed with the paired feeding technique showed a decrease in calcium transport of nephrectomized animals compared to controls (4.0 vs 5.9). Defective calcium transport in gut sacs from partially nephrectomized animals was restored by prior administration of large amounts of vitamin D_3 (ratio 7.5 vs control 6.6 with 10,000 IU D_3 and 5.9 vs control 5.9 with 6,000 IU D_3). Experiments undertaken to determine the effects of renal insufficiency on various segments of small intestine to transfer calcium showed that transfer of calcium from the mucosal to the serosal medium is decreased in renal insufficiency. This effect was most marked in the duodenum, less in the distal ilium, and insignificant in the jejunum corresponding to the distribution pattern of the vitamin D dependent active transport mechanism for calcium. However, since neither the metabolism of vitamin D nor the levels of calcium finding protein activity were affected in these experiments, renal insufficiency appears to affect the cellular mechanisms of calcium transport in a manner independent of a direct interaction with Vitamin D.

7070 THE INFLUENCE OF AGE ON THE XYLOSE ABSORPTION TEST.

(E.) Kendall, M. J. (Queen Elizabeth Hosp., Birmingham, England). *Gut* 11(6):498-501, 1970.

The xylose absorption test was used to study the effects of age on xylose absorption and excretion in 100 unselected normal subjects. A p.o. xylose absorption test and an i.v. test were performed following administration of 5 g of D-xylose and urine was collected and assayed for xylose. Mean xylose excretion in the p.o. test decreased with advancing age; age group 10-20 yr showed 1.18 g excretion as compared with 0.51 g in the over 70 yr group in 2 hr. The results of the i.v. test also demonstrated a clear decrease with age, from 2.09 g excretion in the 10-20 yr group to 0.97 g in the over 70 yr category in 2 hr. The decline in xylose excretion appears to be due to diminished renal excretion rather than reduced intestinal absorption.

7071 PHYSIOLOGICAL FACTORS AFFECTING INTESTINAL DRUG ABSORPTION. *(E.)* Diamond, L. (Coll. U. Kentucky, Lexington), J. T. Doluiso and W. C. Crouthamel. *Europ J Pharmacol* 11(1):109-114, 1970.

Using an *in situ* technique for determining drug absorption rates from isolated segments of the gastrointestinal tracts of anesthetized animals it was shown that the absorption of salicylic acid, barbital and sulfaethidole followed apparent first order kinetics; the absorption half-lives were 8, 19 and 32 min, resp. When a fasting period exceeding 20-25 hr preceded the experiments, the absorption half-lives increased significantly and the absorption rate decreased in proportion to the fasting time. Investigation of the influence of alterations in mesenteric blood flow on the absorption profile of sulfaethidole revealed that half-lives of 17, 37, 56 and 134 min were found for 100, 64, 26 and 0% of control blood flow rate, resp. The absorption process in these experiments apparently obeyed first order kinetics, suggesting a meaningful relation between intestinal blood perfusion and drug absorption rate.

MOTILITY

7078 GASTRIC AND DUODENAL MOTILITY, FOOD INTAKE AND HUNGER MEASURED IN MAN DURING A 24-HR PERIOD. *(E.)* Stunkard, A. J. (Hosp. U. Pennsylvania, Philadelphia), P. B. Bloom, R. D. L. Filion, S. Fox and E. Stellar. *Amer J Dig Dis* 15(8):719-725, 1970.

Duodenal and gastric motility were investigated in 3 healthy women over a 24 hr period while the subjects rated their hunger sensations. Each subject spent the entire 24 hr in bed with motility monitoring devices and was allowed to take liquid Metrecal *ad lib*. Gastric motility was greater from 11 PM to 7 AM (135 min) than from 7 AM to 11 PM (50 min) as was duodenal motility. Hunger was found to be increasing in intensity 58% of the time when hunger ratings were recorded. Increased motility also occurred during periods of increasing hunger ratings, although a dramatic increase in hunger was sometime found without motility. Neither duodenal nor gastric motility appear to influence food intake.

SECRETION AND METABOLISM

Stomach

7089 EFFECT OF INTRAGASTRIC HYPEROSMOLAL SOLUTIONS ON GASTRIC FUNCTION. *(E.)* Harper, A. A. (Med. Sch. U. Newcastle, England), J. D. Reed and J. R. Smy. *J Physiol* 209(2):453-472, 1970.

The effects of intragastric hyperosmolal solutions on resting and secreting stomachs of anesthetized cats were studied. Hyperosmolal solutions reduced acid secretion in response to histamine and gastrin (86 and 46%, resp.) and there was a significant correlation between increase in osmolality and decrease in acid response to small doses of gastrin 1 mg/15 min. A continuous acid secretion produced by large doses (10 mg/15 min) of gastrin was not significantly reduced by hyperosmolal solutions. The loss of H^+ from resting stomachs was greatest at low pH, but was insufficient to account for the H^+ loss from secreting stomachs at similar pH. The Na^+ output in resting stomachs was increased by hyperosmolal solutions, the increase being related only to the osmolality of the solutions; for the same degree of hyperosmolality there was no difference between sodium output in the resting and secreting stomachs. The H^+ deficit associated with intragastric hyperosmolal conditions apparently does not depend upon a neutral mechanism, a blood-born hormone, or a reduction in gastric blood flow. Probably, there is an inhibition of oxyntic cell activity by release of a chemical agent from the surface cells of the mucosa.

7090 *IN VITRO* EFFECTS OF POLYVINYLPYRROLIDONE ON THE ENZYMATIC ACTION OF PEPSIN. *(E.)*

Reyes Ferretti, E. (West Central Regional U., Barquisimeto, Venezuela), O. Valbuena, M. L. Gimenez and K. Gaede. *FEBS Letters* 9(4):194-196, 1970.

Polyvinylpyrrolidone, a neutral molecule, inhibited the action of pepsin on hemoglobin at pH 1-3. Treatment of polyvinylpyrrolidone with hot hydrochloric acid (a treatment which gave a 3-8% hydrolyzed product), did not enhance the action of the inhibitor. No inhibition occurred when hemoglobin, under similar conditions, was incubated with pepsin at pH 1 in the presence of 6-21 mg of monomer, 1-vinyl-2-pyrrolidone. Polyvinylpyrrolidone appeared to enhance the milk clotting activity of pepsin at pH 5-6, whereas the natural pepsin inhibitor decreased milk clotting under similar conditions. The mechanism by which polyvinylpyrrolidone inhibited the proteolytic action of pepsin on ovalbumin and hemoglobin, but activated the milk clotting action, must be different from that involved in pepsin interaction with basic polymers, since the vinyl polymer is a neutral molecule and has no charged groups or donors for hydrogen bond formation.

7091 INHIBITION OF PEPTIC ACTIVITY BY CARBENOXOLONE AND GLYCYRRHETINIC ACID. *(E.)*

Henman, F. D. (May & Baker Ltd., Res. Lab., Dagenham, Essex, England). *Gut* 11(4):344-351, 1970.

The effect of carbenoxolone and glycyrrhetinic acid on peptic activity and total acidity of gastric juice obtained from anesthetized pylorus-ligated rats was investigated. Pretreatment with carbenoxolone did not change the volume of gastric juice or K$^+$ concentration, but a dose-dependant inhibition of peptic activity was observed (6.6% and 99% inhibition with 12.5 mg/kg and 200 mg/kg, resp.). A reduction in total acid output was observed with all doses of carbenoxolone but this effect was less marked than the peptic inhibition. Glycyrrhetinic acid was less effective (53.5% inhibition at 200 mg/kg) than carbenoxolone in reducing peptic activity and had no effect on total acid. After 17 days' pretreatment both treated groups had less peptic activity than controls, but this trend was not significant. After 23 days' pretreatment, the combination of carbenoxolone and spironolactone decreased peptic activity (17.4 μg/ml x 10^2) compared to controls (21.9 μg/ml x 10^2) but the carbenoxolone-treated animals gave a higher value than the controls (24.8 μg/ml x 10^2). Both carbenoxolone and Roter (bismuth subnitrate) reduced peptic activity *in vitro*, the former being 10 times more active than Roter. In the pepsin plate experiments, dose-dependent inhibition of peptic digestion similar to that seen in pylorus-ligated rats was observed with carbenoxolone, complete inhibition of 10 μg pepsin occurring with 250 μg carbenoxolone. The actions of carbenoxolone may be useful in treatment of peptic ulcers.

7092 EFFECT OF SECRETIN AND CHOLECYSTOKININ ON PENTAGASTRIN-STIMULATED GASTRIC SECRETION IN MAN. *(E.)*

Grossman, M. I. (VA Ctr., Los Angeles, Calif.) and A. M. Brooks. *Gastroenterology* 59(1):114-119, 1970.

The effects of secretin (2 U/kg/hr i.v.) and cholecystokinin (4 U/kg/hr i.v.) were determined on pentagastrin-stimulated (4 μg/kg/hr i.v.) gastric secretion in human volunteers using modified double lumen Dreiling tubes fitted with inflatable cuffs to prevent reflux of duodenal contents into the stomach. Secretin inhibited the gastric acid output in response to pentagastrin from 80% of the initial output as seen in controls to approximately 60% and increased pepsin output, while cholecystokinin inhibited the acid output by 33% and did not affect pepsin output. Secretin at a higher dose (6 U/kg/hr) inhibited gastric acid output by 50% compared to the 21% of the lower dose, and highly purified cholecystokinin used in 1 subject inhibited the acid output by only 49% compared to the 78% of the commercial material used in the same subject.

7093 CONCENTRATIONS OF ANTRAL GASTRIN IN THE FETAL, NEONATAL AND ADULT DOG. *(E.)*

Thompson, J. C. (U. Texas Med. Branch, Galveston), J. L. Ban, D. D. Reeder, B. G. Clendinnen, F. M. Hirose and J. H. Miller. *Arch Surg* 101(3):406-410, 1970.

Gastrin concentrations were measured in the antral mucosa of over 100 dogs from 4 weeks before birth to adulthood by radioimmunoassay. Antra and sera from the fetuses were pooled according to litters to obtain sufficient volume for the tests. Gastrin was found in all prenatal specimens, the mean concentration being 1.3 ng/g in younger fetuses and 1.8 ng/g in fetuses less than 2 weeks from term. Postnatal gastrin values (1 day to 3 weeks) averaged 1.7 ng/g and gastrin in the adult canine antrum measured 3.5 ng/g. Prenatal serum gastrin values were small (< 28 pg/ml) when compared with a serum value of 46 pg/ml in 8 to 12 weeks pups. Antral gastrin was therefore found to be greater in adults and in 8 to 12 week pups than in canine fetuses although parietal cells are present and secreting in the canine fundus as early as 4 weeks after birth.

7094 GASTRIC SECRETION OF MAGNESIUM FOLLOWING STIMULATION WITH PEPTAVLON AND HISTAMINE. *(E.)*

Aagaard, P. (U. Hosp. Copenhagen, Denmark) and J. Christiansen. *Gastroenterology* 59(1):46-49, 1970.

Gastric secretion of magnesium following stimulation with histamine and peptavlon (a new synthetic pentapeptide) was investigated in 16 patients who underwent operations for duodenal ulcer. After administration of histamine or peptavlon at doses of 0.7 or 0.1 μg/kg/min i.v., resp., there was a distinct increase in concentration of H$^+$, output of H$^+$, and volume of gastric juice; after 30-45 min, a relatively constant level was reached. A significant increase in the output of magnesium from the basal levels (10 μEq/15 min) to the peak values (50-60 μEq/15 min) occurred after 15 min of stimulation with histamine and peptavlon, and after 1 hr the magnesium output returned to a level 2 times greater than the basal level. There was a 2-fold increase from the basal period to the peak value, in the concentration of magnesium after both agents, and this was followed by a drop to a new level lower than the basal levels.

There appeared to be a decrease in concentration and
an increase in output of magnesium following stimulation of the stomach with histamine and peptavlon.

7095 FURTHER PURIFICATION OF A POLYPEPTIDE DEMONSTRATING ENTEROGASTRONE ACTIVITY.
(E.) Brown, J. C. (Dept. Physiol., U. British Colum-
ɔia, Vancouver, Canada), V. Mutt and R. A. Pederson.
I Physiol 209(1):57-64, 1970.

Biochemical purification and analysis of a polypeptide
having enterogastrone activity with no cholecysto-
kinin or pancreozymin effects was described. Puri-
fied fractions were tested on 3 conscious dogs with
denervated fundic pouches and cholecystokinin activ-
ity was bioassayed with guinea pig gall bladder.
After Sephadex gel filtration of partially purified
cholecystokinin-pancreozymin, all fractions not
showing cholecystokinin activity were pooled, adsorbed
to alginic acid and fractionated on CM-cellulose or
Sephadex G-25. Amino acid analysis revealed the
bsence of proline and the presence of high concen-
trations of aspartate, glutamate, and lysine. Acid
output from pentagastrin (4.0 μg/kg/hr) stimulation
of the pouches fell 36 to 70% within 15 min after
administration of the polypeptide (0.25, 0.5 or 1.0
g/kg/hr). Identification of the polypeptide in the
lood and further analysis of its physiological
effects will be necessary before its role is
nderstood.

Pancreas

01 A MODIFIED ANNULA FOR SAMPLING PANCREATIC JUICE IN THE DOG. *(E.)* Fawcett, A. N. (Roy.
firm. Sheffield, England). *Gut* 11(6):532-533, 1970.

new technique for collection of pancreatic juice
chronic animal studies was described. The abdomen
s opened and the duodenum divided transversely
tween the common bile duct and the main pancreatic
ct and also at a small distance distal to the pan-
eatic duct with the end of the intervening segment
osed to form a pouch into which the secretion drains.
The proximal duodenum was anastomosed end to side in the area of the duodenal-jejunal junction for continuity. One part (A) of the cannula from the pancreatic duct was inserted through an antimesenteric slit in the duodenal pouch and secured by purse string sutures. The second part (B) of the cannula was inserted into the pouch at the opposite wall to A and was connected to the abdominal wall; part B screws firmly into A. Two dogs fixed with the cannula have been prepared and have enjoyed good postoperative health with no complications.

SECRETION AND METABOLISM

Hepatobiliary Tract

7105 THE SENSITIVITY OF DICARBOXYLATE ANION EXCHANGE REACTIONS TO TRANSPORT INHIBITORS IN RAT LIVER MITOCHONDRIA. *(E.)* Robinson, B. H. (Dept. Biochem., U. Toronto, Canada) and G. R. Williams. *Biochim Biophys Acta* 216(1):63-70, 1970.

The sensitivity of dicarboxylate anion exchange reactions to transport inhibitors was studied in rat liver mitochondria loaded with ^{14}C-labeled succinate, L-malate or malonate, and exchange of label with unlabeled dicarboxylate anion and P_i was measured at 0°C. The 'inhibitor stop' technique was used to determine the rates of exchange and the concentration dependence of these rates. The P_i/L-^{14}C-malate exchange was completely inhibited by 12.5 mM butylmalonate, while the malonate/L-^{14}C-malate exchange required 25 mM butylmalonate for complete inhibition and the L-malate/L-^{14}C-malate exchange required 25 mM of *p*-iodobenzylmalonate. The P_i/^{14}C-dicarboxylate exchanges were slower than the corresponding malonate/^{14}C-dicarboxylate exchanges when 1 mM P_i or malonate were used, although the K_m values for P_i- and malonate-stimulated exchanges were not very different for each category of ^{14}C-dicarboxylate anion. The different sensitivities of the P_i-dicarboxylate to butylmalonate inhibition and the dicarboxylate-dicarboxylate exchanges are probably due to differences in substrate binding affinities at the extramitochondrial side of the anion exchange carrier.

7106 THE EFFECTS OF 2-ETHYLCITRATE AND TRICARBALLYLATE ON CITRATE TRANSPORT IN RAT LIVER MITOCHONDRIA AND FATTY ACID SYNTHESIS IN RAT WHITE ADIPOSE TISSUE. *(E.)* Robinson, B. H. (Dept. Biochem. U. Toronto, Ontario, Canada), G. R. Williams, M. L. Halperin and C. C. Leznoff. *Europ J Biochem* 15(2):263-272, 1970.

Fluorimetric measurement of intramitochondrial (rat liver) NAD(P) reduction showed 2-ethylcitrate and propane-1,2,3,-tricarboxylic acid (tricarballylate) to be inhibitors of the citrate transport system as monitored by *cis*-aconitate and isocitrate oxidation. Kinetic data showed the inhibitions to be competitive with tricarboxylate anion. When the exchange of intramitochondrial ^{14}C-citrate with added extramitochondrial citrate or L-malate was measured at low temperatures, 2-ethylcitrate and 2-propylcitrate were found to be good inhibitors, while tricarballylate did not inhibit and was actually a good substrate for exchange on the transporting system. Using epididymal fat pads from rats, neither 2-ethylcitrate nor tricarballylate at low concentrations (less than 10 mM) were found to inhibit fatty acid synthesis with pyruvate as precursor, but both were potent inhibitors of fatty acid synthesis with glucose as precursor (30% inhibition, accompanied by a similar decrease in pyruvate and lactate outputs).

7107 STUDIES ON THE PHOSPHOLIPID METABOLISM IN CHOLINE-DEFICIENT GUINEA PIGS: I. INCREASED ACTIVITY OF LECITHIN SYNTHESIS IN LIVER SLICES. *(E.)* Suzuki, S. (Aichi Cancer Ctr. Res. Inst., Nagoya, Japan), M. Kobayashi and Y. Kotake. *J Vitamin* 16(2):107-118, 1970.

Liver slices from male and female guinea pigs placed on choline-deficient and choline-supplemented (contr diets were used to compare lecithin synthesis from 4 radioactive precursors. Incorporation of 10 μC ^{32}PO into the phosphatidylcholine fraction relative to that into the phosphatidylethanolamine fraction was higher in the choline-deficient group than in the control group. Liver slices from choline-deficient animals incubated with 1 µC choline-$^{14}CH_3$ (0.22 µmoles) showed a higher incorporation of radioactivity into phosphatidylcholine than control animals, but there was no difference between the two groups in the incorporation of ethanolamine-^{14}C into phosphatidylethanolamine, although more of this radioactivity was found in phosphatidylcholine in the choline-deficient group than in controls. The choline-deficient group also showed a 2-fold incorporation of the labeled methyl group from L-methionine-C^3H_3 as compared with the control group. As the activity of methionine activating enzyme was the same level in the 2 groups, the higher activity of phosphatidylmethyltransferase system appeared to be responsible for the higher phospholipid methylating activity in the choline deficient group. Preincubation of the liver slices with *N*-methylethanolamine or *N*,*N*-dimethylethanolamine prior to addition of L-methionine-C^3H_3 doubled the incorporation of labeled methyl groups into the phospholipids.

7108 GROWTH HORMONE INDUCTION OF ORNITHINE DECARBOXYLASE IN RAT LIVER. *(E.)* Russell, D. H. (Baltimore Cancer Res. Ctr., Md.), S. H. Snyder and V. J. Medina. *Endocrinology* 86(6):1414-1419, 1970.

The effect of growth hormone on hepatic ornithine decarboxylase activity was investigated in adult and weanling rats. Single injections of growth hormone (25 mg/kg) produced up to 30-fold increases in ornithine decarboxylase activity in both adults and weanlings; however, with lower doses of growth hormone (1 mg/kg), a greater increase in activity occurred in weanlings (10-fold) than in adults (4-fold). Both adult and weanling rats showed the same time course of ornithine decarboxylase activity enhancement after growth hormone with peak enzymatic activity at 4 hr and a decline to basal levels by 8 hr after hormone administration. Cycloheximide completely prevented the stimulation of ornithine carboxylase activity regardless of the time of its administration (1 hr before or 1, 2, or 3 hr following growth hormone administration). Actinomycin D (2 mg/kg) given immediately prior to growth hormone administration almost totally prevented the growth hormone-induced increase in enzyme activity. however, the ability of actinomycin D to inhibit ornithine decarboxylase activity enhancement decreased as the time interval between growth hormone administration and actinomycin D treatment increased. In weanling rats receiving cycloheximide 3 hr after growth hormone, ornithine decarboxylase activity decreased rapidly with a half life of about 15 min, indicating an extremely rapid turnover rate for the enzyme. The half-life calculated from the natural decline of growth hormone-induced ornithine decarboxylase activity was about 24 min.

7109 STUDIES ON LYSOSOMES: XIII. EFFECTS OF STILBAMIDINE AND HYDROXYSTILBAMIDINE ON *IN VITRO* AND *IN VIVO* SYSTEMS. *(E.)* Weissmann, G. New York U. Sch. Med., New York), P. Davies, K. Krakauer and R. Hirschhorn. *Biochem Pharmacol* 9(4):1251-1261, 1970.

The effects of stilbamidine and hydroxystilbamidine on rabbit liver lysosomes *in vitro* and *in vivo* were investigated. At 10^{-4} M, the stilbamidines had no inhibitory effect upon the free activity of any of the lysosomal hydrolases in soluble form (β-glycerol phosphatase, β-glucuronidase, aryl sulfatase or cathepsin) whereas at 10^{-3} M the drugs inhibited β-glycerol phosphatase, β-glucuronidase and aryl sulfatase. At concentrations between 5 x 10^{-5} and 10^{-3} M, stilbamidine retarded cathepsin release by retinol or solvent alone but had no effect upon the activity of the enzyme when the granules had been totally disrupted by Triton X-100. Hydroxystilbamidine (10^{-4} M) effectively retarded release of aryl sulfatase both by diethylstilbestrol (5 x 10^{-4} M) and its solvent dimethylsulfoxide (2.0%, v/v). Enzyme release provoked by ultraviolet irradiation was diminished if the granule fractions had been pretreated with stilbamidine. Vitamin A (5 X 10^5 IU)-induced ear cartilage collapse and severe loss of hair were delayed when animals were treated with stilbamidine concurrently with vitamin A. At concentrations of 5 x 10^{-4} M and 10^{-4} M, stilbamidine and hydroxystilbamidine inhibited uridine incorporation into acid precipitable material by approximately 20% during the first 3 hr after phytohemagglutinin stimulation. The effects of stilbamidines in each of these systems apparently resemble those of equivalent concentrations of cortisol and chloroquine.

7110 EFFECTS OF IRON, RIBOFLAVIN AND IODIDE DEFICIENCIES ON HEPATIC DRUG-METABOLIZING ENZYME SYSTEMS. *(E.)* Catz, C. S. (Dept. Pediat., State U. New York, Buffalo), M. R. Juchau and S. J. Yaffe. *J Pharmacol Exp Ther* 174(2):197-205, 1970.

The effects of iron, riboflavin and iodide nutritional deficiencies on hepatic drug-oxidizing, -reducing and -glucuronidating systems, microsomal cytochromes and hexobarbital sleeping times were studied in adult mice. Chronic iron deficiency resulted in an increase in hexobarbital side chain oxidation (iron-supplemented, 15.3 nmoles/mg protein vs iron-deficient, 25.5), aminopyrine N-demethylation (iron-supplemented, 16.1 vs iron-deficient, 22.9), and microsomal cytochrome b_5 concentrations; no significant changes occurred in sleeping times and in cytochrome P-450 content. Riboflavin deficiency in weanling mice resulted in a biphasic effect on sleeping times, an initial decrease followed by an increase after 15 days on the deficient diet. Microsomal cytochrome P-450 content was markedly increased by riboflavin deficiency but oxidative metabolism measured *in vitro* was only slightly increased. Iodide deficiency in hypothyroid (propylthiouracil-treated) mice resulted in marked increases in drug-oxidizing activity *in vitro*, compared to activities measured in liver homogenates from iodide-supplemented hypothyroid animals. Microsomal content of cytochrome b_5 and P-450 were increased but p-nitrobenzoic acid reduction and p-nitrophenol conjugation were not affected by iodide deficiency. Hexobarbital sleeping times correlated well with *in vitro* enzymic activities in experiments with iodide-deficient mice but little or no correlation was observed in riboflavin-or iron-deficient animals.

7111 INFLUENCE OF DIETARY LIPID ON LIPOGENESIS AND ON THE ACTIVITY OF MALIC ENZYME AND CITRATE CLEAVAGE ENZYME IN LIVER OF THE GROWING CHICK.

(E.) Yeh, Y. Y. (Dept. Anim. Sci., U. Illinois, Urbana-Champaign), G. A. Leveille and J. H. Wiley. *J Nutr* 100(8):917-924, 1970.

Fatty acid synthesis (incorporation of acetate-1-^{14}C or glucose-U-^{14}C), malic enzyme, and citrate cleavage enzyme activities were determined in male crossbred chicks after acute and chronic forced feedings of high fat diets. One hr after the acute feeding, fatty acid synthesis (nmole incorporated/100 mg liver/ 2 hr) from acetate-1-^{14}C dropped from 1178 to 161 and from 926 to 470 in 2 separate experiments, and synthesis from glucose-U-^{14}C dropped from 66 to 10 and from 49 to 28; after 2 hr no further change was observed in the first experiment but synthesis dropped another 30-40% in the second experiment. Malic enzyme and citrate cleavage enzyme activities were not affected. In animals fed a 10% lipid diet for 3 weeks, fatty acid synthesis decreased from acetate (1074 to 336) and from glucose (63 to 18); in animals fed a 20% lipid diet, there was an even greater decrease in fatty acid synthesis from acetate (1074 to 8) and from glucose (63 to 0.7). *In vivo* studies substantiated the decrease in the fatty acid synthesis (30% of control with 10% lipid and 5% of control with 20% lipid from acetate, and 20% of control with 10% lipid and to 2% with 20% lipid from glucose). Both malic enzyme and citrate cleavage enzyme activities dropped from control values (64 and 55 nmole/mg/min, resp.) with 10% lipid diet (33 and 31 nmole/mg/min, resp.) and with the 20% lipid diet (9 and 16 nmole/mg/min, resp.), and a carbohydrate-free diet with 29% corn oil lowered malic and citrate cleavage enzyme activities (107 to 30 and 189 to 10 nmole/mg/ml, resp.). Definite correlations were observed between fatty acid synthesis and citrate cleavage enzymes (r of 0.826), between fatty acid synthesis and malic enzyme (r of 0.781), and between malic and citrate cleavage enzymes (r of 0.802).

7112 EFFECT OF CCL$_4$ ON THE VITAMIN-PROTEIN PROFILE OF RAT LIVER SUBCELLULAR ELEMENTS.

(E.) Baker, H. (New Jersey Coll. Med. Dent., East Orange), A. V. Luisada-Opper, O. Frank, S. Feingold and C. M. Leevy. *Exp Molec Path* 12(3):306-315, 1970.

Vitamin distribution in subcellular fractions from normal rat liver was compared with that in fractions from CCl$_4$-injured (0.2 ml/100 gm intragastrically) liver. The nucleus and cytosol contained the highest proportions of all vitamins and protein, and the microsomes and lysosomal fraction contained the least in normal liver. During acute necrosis the nucleus and lysosomal fraction released protein into the cytosol, and at maximal necrosis (24 hr) the lysosomal protein titer was decreased to about 1/4 of that seen in untreated animals. During regeneration, a massive influx of protein into the nucleus resulted in about 2.5 times more protein than at the time of maximal necrosis and 2 times more than in controls, and the microsomal protein decreased to about half that of the control animals. Vitamin B$_{12}$ and folate were increased in the nucleus, mitochondria, and microsomes during CCl$_4$ injury and recovery, creating a stockpile of these RNA- and DNA- synthesizing vitamins for repair processes. The best index of injury and repair may be the shifts in the various types of folate and vitamin B$_{12}$ in the cytosol and nucleus.

7113 STUDIES ON THE ACTIVE SITE OF MIXED FUNCTION OXIDASES IN RABBIT LIVER MICROSOMES.

(E.) Hlavica, P. (Pharmacol. Inst. U. Munich, Germany). *Biochem Biophys Res Commun* 40(1):212-217, 1970.

The influence of the hydrogen ion concentration on the Michaelis constants and maximum reaction velocities in the N-oxygenation of aniline, N-ethylaniline and N,N-dimethylaniline was studied in rabbit liver microsomes. The free groups in the active center of the microsomal oxygenases catalyzing the N-oxygenation of aniline, N-ethylaniline and N,N-dimethylaniline were shown to have pKs of 7 and 7.4. Aniline was bound to the oxidized form of the oxygenase, whereas N-ethylaniline and N,N-dimethylaniline were bound to the reduced form of the N-oxygenating system. At least two different hydroxylases seem to be involved in the N-oxygenation of compounds, one for aniline and another for N-ethylaniline and N,N-dimethylaniline.

7114 AMINO ACID TRANSPORT IN HEPATOMA CELL CULTURES DURING TYROSINE AMINOTRANSFERASE INDUCTION.

(E.) Potter, V. R. (McArdle Lab., U. Wisconsin, Madison), E. L. Krawitt, E. F. Baril and J. E. Becker. *Science* 169(3942):294-296, 1970.

Amino acid (α-aminoisobutyric acid) transport in hepatoma cell cultures during tyrosine aminotransferase induction was investigated. α-Aminoisobutyric acid transport was increased by insulin (0.5 μg/ ml) but not by hydrocortisone (control 1.8, 1.6; treatment 3.1, 1.7 dpm/mg/hr x 10^3, resp.). Both of these agents induced tyrosine aminotransferase activity in this sytem (control 0.26, 0.21; treatment 0.46, 2.55 μmole/mg/hr, resp.). The apparent increase in α-aminoisobutyric acid transport and tyrosine aminotransferase activity produced by glucagon 1.6-fold and 3-fold, resp.) was probably caused by insulin contamination. Insulin did not increase transport in this system until after tyrosine aminotransferase activity had reached maximum levels (3 hr). The underlying mechanisms increasing α-aminoisobutyric acid transport appear to differ from those for tyrosine aminotransferase induction with hydrocortisone

7115 THE ENZYMATIC DECARBOXYLATION OF DOPA IN HUMAN LIVER HOMOGENATES.

(E.) Vogel, W. H. (Jefferson Med. Coll., Philadelphia, Pa.), R. Snyder and T. A. Hare. *Proc Soc Exp Biol Med* 134(2):477-481, 1970.

Human liver tissue was investigated for the presence of aromatic amino acid decarboxylase and for the effects of various drugs and metabolites on the enzyme. Liver homogenates were obtained between 6 to 11 hr post-mortem from adult patients dying of coronary occlusion. After storage at -73°, decarboxylation of DOPA was determined by measuring $^{14}CO_2$ formation after DL-DOPA-1-^{14}C incubation. The rate of DOPA decarboxylation was constant for 90 min and linear with the DOPA concentration in the 1.5 x 10^{-5} to 7.5 x 10^{-5} M range at the pH optimum of 7 to 8. The enzyme activity was 50% inhibited by 30 μM *p*-chloro- ercuribenzoate, 70 μM dopamine, 400 μM 5-hydroxy- ryptophan, and 5 and 200 μM phenylpyruvate (liver omogenates from 2 individuals had high sensitivity) hereas EDTA, chlorpromazine, phenylalanine, d-methyl- OPA and α-methyltyrosine were not inhibitory in less han mM concentrations. A nonenzymatic decarboxylation of DOPA which was enhanced by dialysis of either resh or boiled homogenate was also observed.

'116 LIVER REGENERATION: OLD AND NEW CONCEPTS.

(E.) Gentile, J. M. (C. H. U. Sherbrooke, uebec, Canada), L. Avila and J. T. Grace, Jr. *Amer Surg* 120(1):2-6, 1970.

osthepatectomy serum samples from male rats obtained mmediately after exsanguination were examined with n *in vitro* bioassay system employing rat and mouse ibroblasts for a factor that stimulates cell divi- ion in cell culture. The addition of 5% post- epatectomy (partial) rat serum to spinner cultures f L 929 cells significantly enhanced cellular rowth after 75 hr after addition of the serum. The rowth enhancing ability was present in serum drawn rom animals 20 hr after surgery, reached a peak at 4 hr, and then decreased but was still detectable fter 72 hr. The effects of this growth stimulating actor were confirmed by a 10-fold increase in the itotic index of embryonic rat fibroblasts grown in eighton tubes compared to controls. Treatment with rypsin or desoxyribonuclease did not affect the timulating activity of the posthepatectomy serum, ut bovine and micrococcus ribonucleases completely emoved the stimulating activity.

117 RATES OF TURNOVER OF DEOXYTHYMIDINE KINASE AND OF ITS TEMPLATE RNA IN NOVIKOFF HEPATOMA ND NEONATAL LIVER.

(E.) Bresnick, E. (Baylor Coll. ed., Houston, Tex.) and S. S. Burleson. *Cancer es* 30(4):1060-1063, 1970.

e rates of turnover of deoxythymidine kinase and of ts template RNA in Novikoff ascites hepatoma and eonatal rat liver were studied by the use of actino- cin D and cycloheximide. Actinomycin D (5-50 μg/ml) hibited the incorporation of uridine-^{14}C into RNA the Novikoff ascites hepatoma cells by more than %. Under these conditions, however, little change deoxythymidine kinase activity was observed during e duration of the experiment (4 hr). Puromycin 00 μg/ml) and cycloheximide (400 μg/ml) effectively ocked the incorporation of aspartate-^{14}C into hepa- ma cell protein (90%) and decreased deoxythymidine nase activity with a half life of decay of 3.5 hr. nce aspartate transcarbamylase activity was not tered under identical conditions during the 4 hr incubation in the presence of either cycloheximide puromycin, the decrease in deoxythmidine kinase s apparently not a generalized effect upon enzyme tivity.

7118 STUDIES ON THE DEMETHYLATION, HYDROXYLATION AND N-OXIDATION OF IMIPRAMINE IN RAT LIVER.

(E.) Nakazawa, K. (Kyoto U. Fac. Med., Japan). *Biochem Pharmacol* 19(4):1363-1369, 1970.

Possible relations between the N-oxidation, demethylation, and 2-hydroxylation reactions were studied in the post mitochondrial supernatant of rat liver incubated with imipramine-^{14}C. Imipramine-N-oxide was not involved as an intermediate in the formation of desmethylimipramine from imipramine. Demethylation and 2-hydroxylation reactions were stimulated 2-fold following phenobarbital treatment, while the enzyme system for the N-oxidation reaction was not induced. N-oxidation was relatively insensitive to inhibitors such as SKF 525A, but demethylation was very sensitive (> 95% inhibition with 0.1 mM SKF 525 A). The metabolic pathways of imipramine (demethylation and 2-hydroxylation or N-oxidation) appear to be independent of one another, and some unexpected clinical effects of imipramine may be due to altered activities of an enzyme responsible for the biotransformation of this drug.

7119 SULFOBROMOPHTHALEIN METABOLISM AND EXCRETION IN RATS WITH IODOMETHANE-INDUCED DEPLETION OF HEPATIC GLUTATHIONE.

(E.) Plaa, G. L. (Fac. Med. U. Montreal, Quebec, Canada) and B. G. Priestly. *J Pharmacol Exp Ther* 174(2):221-231, 1970.

BSP metabolism and excretion were studied in rats with iodomethane-induced depletion of hepatic glutathione. Pretreatment with 75 mg/kg p.o. of iodomethane resulted in depletion of hepatic glutathione with maximal response between 1 and 2 hr after administration (controls, 285 μg/100 mg liver; 1 hr, 180; 2 hr, 150). BSP infusion into untreated rats produced a similar depletion of glutathione (183 μg/100 mg liver) and significantly augmented depletion caused by iodomethane treatment (95 μg/100 mg liver); lower doses of iodomethane (37.5 and 18.75 mg/kg) did not produce significant depletion of glutathione. When BSP (2.5 mg/min/kg) was infused i.v., biliary concentration of total BSP was significantly lower in iodomethane-treated rats (0.39 mg/min/kg) than in untreated controls (0.92 mg/min/kg). Although the ability of the hepatic enzyme system to catalyze BSP-glutathione conjugation *in vitro* was not impaired, depletion of glutathione by pretreatment with iodomethane produced lower biliary concentrations of BSP-glutathione and higher biliary concentrations of unconjugated BSP. Single rapid doses (20 and 60 mg/kg) of BSP resulted in no differences in BSP excretion between iodomethane and untreated rats.

7120 STUDIES ON THE INDUCTION AND REPRESSION OF L-SERINE-DEHYDRATASE IN RAT LIVER.

(Ger.) Straub, K. (Biochem. Inst. U. Freiburg, Germany), H. Jennissen and H. Kroger. *Z Ges Exp Med* 152(4):294-305, 1970.

Induction and repression of L-serine dehydratase was studied in livers of normal and adrenolectomized female rats fed a protein-free diet for 5 days prior to the experiment. The enzyme was induced by starvation, by casein hydrolysate (1 g/150 g by stomach tube) and by L-tryptophan (400 mg/kg i.p. every 8 hr during a 50 hr starvation period). The L-serine dehydratase activity was repressed by glucose (1 g/150 g administered 35-96 hr after feeding of casein hydrolysate) and by lactate, pyruvate and glycerin in normal rats. Actinomycin repressed further induction of L-serine dehydratase activity but not to the same degree as glucose. Induction of enzymatic activity was diminished with increased age of the animals; the activity was 6x higher in 26 day old rats after induction by starvation, and 3 x higher in 30-day-old rats after feeding of casein hydrolysate, both in comparison with 126-day-old animals. In adrenalectomized animals, cortisone (10 mg/150 g i.p.) caused a parallel rise of L-serine dehydratase activity and liver glycogen, while in normal rats L-serine dehydratase activity decreased and glycogen increased.

7121 REGULATION OF HEPATIC TYROSINE TRANSAMINASE *IN VIVO* THROUGH INTERACTION OF NOREPINEPHRINE AND THE PYRIDOXAL PHOSPHATE CO-FACTOR.

(E.) Black, I. B. (Natl. Inst. Mental Hlth., Bethesda, Md.). *J Pharmacol Exp Ther* 174(2):283-289, 1970.

The regulation of hepatic tyrosine transaminase through interaction of norepinephrine and pyridoxal-5'-phosphate co-factor was studied in adrenolectomized rats. Norepinephrine suppressed and ultimately blocked a rise in tyrosine transaminase activity induced by pyridoxine. The pyridoxine-treated group had tyrosine transaminase activity of 154 μmole/g/hr while the control group activity was 68 μmole/g/hr. Tyrosine transaminase levels went from 150 to 70 μmole/g/hr with pyridoxine and 0.1-1.0 mg/kg of norepinephrine. Pyridoxine administration (every 2 hr, 75 mg/100 g) raised enzymatic activity to a new plateau. Enzyme induction was also blocked by dopamine, primary catecholamines which form complexes with the co-factor, and by L-penicillamine, a known binding agent of pyridoxal-5'-phosphate. Circadian rhythm in tyrosine transaminase activity was abolished by cycloheximide and by norepinephrine. Norepinephrine, by competing for the co-factor, apparently inhibits tyrosine transaminase synthesis and contributes to generation of enzyme rhythm.

7122 PLASMA PROTEIN CATABOLISM BY THE PERFUSED RAT LIVER: THE EFFECT OF ALTERATION OF ALBUMIN CONCENTRATION AND DIETARY PROTEIN DEPLETION.

(E.) Hoffenberg, R. (Natl. Inst. Med. Res., London, England), A. H. Gordon, E. G. Black and L. N. Louis. *Biochem J* 118(3):401-404, 1970.

The relation between the rate of albumin catabolism and its plasma concentration and the adaptive fall in catabolism that accompanies low-protein feeding *in vivo* were investigated in the perfused rat liver. The fractional rate of catabolism of albumin, fibrinogen and transferrin were unaffected by the addition of large amounts of albumin. Because of the augmented pool, there was a substantial increase in the absolute amount of albumin degraded per hr, whereas the absolute amounts of the other 2 proteins degraded per hour remained constant. The measurement of albumin catabolic rates with liver from protein-deprived rats in the presence of normal blood and blood from protein-deprived animals demonstrated that when normal blood was used, the fractional rate of catabolism was just below the range found in normal livers (normal 0.068%/hr, treatment 0.032%/hr) but it was abnormally low (0.013 and 0.032%/hr) when blood from protein-deprived rats was used; in one case it was immeasurably low, and the rate became elevated when albumin was added to the perfusate pool (0.043 and 0.068%/hr, resp.). These findings were consistent with the theory of pinocytosis as a step in the degradation of plasma proteins by hepatic parenchymal cells.

7123 THE COMPARTMENTATION OF CoA AND FATTY ACID ACTIVATING ENZYMES IN RAT LIVER MITOCHONDRIA.

(E.) Skrede, S. (U. Hosp. Oslo, Norway) and J. Bremer. *Europ J Biochem* 14(3): 465-472, 1970.

Compartmentation and retention of CoA and localization of fatty acid activating enzymes were studied in rat liver mitochondria with tetrathionate, a selective inhibitor of the outer fatty acid activating system. The inhibition of the fatty acid activating system by tetrathionate (5 mM) was reversed by CoA (16 μM) and potentiated by carnitine (0.8 mM), indicating that a small pool of CoA attached to the outside of the outer membrane exists as acyl-CoA. A leakage of CoA from the mitochondria during the incubations was increased by Pi and 2,4-dinitrophenol (15 and 0.25 mM, resp.). The leakage and inactivation of mitochondrial CoA by uncoupler was reversed by ATP which apparently rephosphorylated the dephospho-CoA formed by uncoupler and reacylated CoA in the reaction mixture. Cystamine (10 mM) inhibited fatty acid oxidation in liver mitochondria (50%). The residual activity appears to be due to an internal system activated by added ATP and inaccessible to the disulfide and this activity may depend on the medium chain synthetase or on a separate enzyme in the matrix compartment. Atractyloside (125 μg) in the presence of 3 μM CoA inhibited both long chain acyl-CoA synthetase and carnitine palmityltransferase (47 and 18% resp.) and the inhibition of both enzymes was counteracted by higher concentrations (40 μM) of CoA (12 and 7% resp.). Fatty acid oxidation in mitochondria apparently can be explained by a simple two compartment model where the inner membrane is the permeability barrier.

7124 EFFECT OF PARATHION ON LIVER MICROSOMAL ENZYME ACTIVITIES INDUCED BY ORGANOCHLORINE PESTICIDES AND DRUGS IN FEMALE RATS.

(E.) MacDonald, W. E. (U. Miami Sch. Med., Florida), J. MacQueen, W. B. Deichmann, T. Hamill and K. Copsey. *Int Arch Arbeitsmed* 26(1):31-44, 1970.

Female rats were treated with a single p.o. dose of parathion in combination with a single p.o. dose of one of a series of organochlorine pesticides and drugs to determine their effects on hepatic microsomal enzyme activity. Enzyme systems studied were O-demethylase, O-dearylase, N-demethylase, azoreductase, and nitro-reductase. Parathion reduced the activities of all 5 systems to about 70% of control; aldrin and chlordane increased all activities 200-600% except that of azo-reductase, and DDT and phenobarbital stimulated O-demethylase and O-dearylase. The stimulation of enzymes systems induced by aldrin, chlordane, DDT, methoxychlor, dimenhydrinate, diphenylhydantoin, and paraldehyde were reduced 50% by parathion, except for the following enzyme-inducer pairs whose activities were augmented 50-100% by parathion: N-demethylase (aldrin); azo-reductase (chlordane); O-demethylase (methoxychlor); azo-reductase and O-demethylase (dimenhydrinate); nitro-reductase (phenobarbital): and azo-reductase and nitro-reductase (trimethadione).

7125 EFFECT OF PYRAZOLE ON HEPATIC FUNCTION AND STRUCTURE. *(E.)* Lieber, C. S. (Mt. Sinai Sch. Med., New York, N. Y.), E. Rubin, L. M. DeCarli, P. Misra and H. Gang. *Lab Invest* 22(6):615-621, 1970.

The effects of pyrazole (0.2 mg/ml) on hepatic function and structure of rats were investigated by morphologic studies and microsomal enzyme assay. *In vitro* pyrazole (2 and 4 mM) inhibited the microsomal ethanol-oxidizing system by 30% and microsomal aniline, pentobarbital, and benzpyrene hydroxylases. The acute administration of 1 dose of pyrazole increased serum bilirubin, decreased serum glucose and urea, and reduced the activity of the microsomal ethanol-oxidizing system (% of control: 121, 88, 74 and 86, resp.). Catalase activity decreased, pentobarbital hydroxylase activity remained unchanged, and aniline and benzpyrene hydroxylase activities increased (% of control: 14, 108, 322, 160, resp.). Ultrastructural changes following pyrazole included dilated bile canaliculi, stunted microvilli, accumulation of osmiophilic material in the canaliculus lumen, enlarged mitochondria and decreased number of parallel arrays of rough endoplasmic reticulum. Chronic pyrazole feeding retarded growth and resulted in a striking increase of liver weight from 2.8 to 4.6 gm/100 gm body weight due to increased total liver protein but not fat or DNA. Microsomal ethanol-oxidizing system, pentobarbital, and benzpyrene hydroxylase activities were all significantly reduced (% of control: 64, 49, 51, resp.). Light and electron microscopy illustrated the presence of centrally located fat droplets, increased and vesicular smooth endoplasmic reticulum, enlarged mitochondria, and normal bile canaliculi with chronic pyrazole treatment. The inhibitory effects of pyrazole, a potent alcohol dehydrogenase inhibitor, are too diffuse for the precise differentiation of the role of alcohol dehydrogenase from that of other enzyme systems involved in ethanol oxidation.

7126 HEPATIC MICROSOMAL ETHANOL OXIDIZING SYSTEM (MEOS): DIFFERENTIATION FROM ALCOHOL DEHYDROGENASE AND NADPH OXIDASE. *(E.)* Lieber, C. S. (VA Hosp., Bronx, N. Y.), E. Rubin and L. M. DeCarli. *Biochem Biophys Res Commun* 40(4):858-865, 1970.

The effects of pyrazole (1, 2, 4 mM) and dimethylsulfoxide (10, 50, 100 mM) on the activity of rat hepatic alcohol dehydrogenase, and the action of pyrazole, dimethylsulfoxide or sodium cholate (14 mM) on the activities of the microsomal ethanol oxidizing system, NADPH oxidase, aniline hydroxylase, and aminopyrine demethylase were studied. Pyrazole (2 and 4 mM) abolished alcohol dehydrogenase activity completely, but reduced microsomal ethanol oxidizing system activity by only 11 and 22%, resp. Following dimethylsulfoxide (10, 50, 100 mM) no decrease in the microsomal ethanol oxidizing system activity was found, but the alcohol dehydrogenase activity of the cytosol was 80% inhibited by 100 mM dimethylsulfoxide. Cholate (14 mM) reduced the activities of NADPH oxidase, the microsomal ethanol oxidizing system, and aminopyrine demethylase by approximately 80% and almost abolished aniline hydroxylase activity. Cholate inactivated cytochrome P-450, as shown by the quantitative conversion to cytochrome P-420 and by the interference with the reduction of cytochrome P-450. Cholate inhibition of both NADPH oxidase and the microsomal ethanol oxidizing system appears to be nonspecific.

7127 INDUCTION AND INHIBITION OF HEPATIC MICROSOMAL AND MITOCHONDRIAL ENZYMES BY ETHANOL. *(E.)* Rubin, E. (Mt. Sinai Sch. Med., City U. New York, N. Y.), P. Bacchin, H. Gang and C. S. Lieber. *Lab Invest* 22(6):569-580, 1970.

The effects of acute (1.5 or 8 g/kg single dose following 24 hr. fasting) and chronic (36% of total calories over various periods of time) ethanol administration on the activity of rat and human hepatic enzymes (microsomal drug-metabolizing enzymes and mitochondrial δ-aminolevulinic acid synthetase) were investigated by morphologic and chemical analyses. Isocaloric replacement of ethanol for carbohydrate in rats fed adequate, deficient, and low fat diets for 15-90 days led to hepatic steatosis (most severe in the deficient diet group), proliferation of the hepatic smooth endoplasmic reticulum, and increased microsomal protein. The activities of aniline and pentobarbital hydroxylases were increased (from 8.5 and 28.8 to 90.5 and 57.8 U, resp.) in rats on a fat deficient diet receiving chronic ethanol administration. Cytochrome P-450 levels also increased (40-80%) in rats with adequate and alcoholic diets. In 3 nonalcoholic volunteers, ethanol administration with an adequate diet induced a 2- to 3-fold increase in activity of pentobarbital hydroxylase, but ethanol competitively inhibited the *in vitro* activities of aniline and pentobarbital hydroxylases (K_i = 3mM, 90 mM, resp.). Acute ethanol administration (8 g/kg) more than tripled the mean hepatic δ-amino levulinic acid synthetase activity; chronic administration produced a 4.4-fold increase in non-fasted rats and no change in 18-hr fasted rats. This increased activity of δ-amino-levulinic acid synthetase, a rate limiting enzyme in porphyrin synthesis, was blocked by treatment with actinomysin or puromycin, indicating that the increased activity may have resulted from new enzyme synthesis. The administration of ethanol apparently produces many effects similar to those produced by drugs such as phenobarbital.

7128 EFFECT OF MORPHINE ADMINISTRATION ON THE HYDROXYLATION OF STEROID HORMONES BY RAT LIVER MICROSOMES. *(E.)* Kato, R. (Natl. Inst. Sci., Tokyo, Japan), A. Takahashi, T. Oshima and E. Hosoya. *J Pharmacol Exp Ther* 174(2):211-220, 1970.

Effect of morphine on hydroxylation of steroid hormones by rat liver microsomes was investigated using chromatographic and spectral methods. Administration of morphine (30-40 mg/kg) decreased cytochrome P-450 content in male rats, but not in female rats (male controls, 0.95 nmole/mg protein vs morphine-treated, 0.76; female controls, 0.72 vs morphine-treated, 0.66). Progesterone and testosterone hydroxylation was markedly decreased in morphine-treated males, but not in females (progesterone, total hydroxylation male controls, 29.2 nmole/mg protein vs morphine-treated 13.7; female controls, 12.1 vs morphine-treated, 10.5; testosterone, total hydroxylation male controls, 49.8 vs morphine-treated 20.3; female controls, 17.3 vs morphine-treated, 18.3). The magnitude of spectral changes induced by progesterone and testosterone was decreased only in morphine-treated male rats, but not in females. Castration of males decreased the spectral changes and hydroxylating activities for progesterone and testosterone (progesterone controls, 32.7 nmole/mg protein vs 16.1 for castrated animals); methyl testosterone administration to castrated rats restored values to those observed in normal rats (30.8 nmole/mg protein). The magnitude of spectral change and hydroxylating activity for progesterone and testosterone in castrated males was not decreased by morphine treatment, but was markedly decreased in testosterone-treated castrated rats. The ratios of hydroxylating activity for progesterone and testosterone to the magnitude of spectral changes were not significantly affected in morphine-treated males and females.

7129 OLIGOMYCIN AND ADP SENSITIVITY OF *IN VITRO* ALKYLATION OF SH-GROUPS IN RAT LIVER MITOCHONDRIA.

(E.) Zimmer, G. (Inst. Vegetative Physiol., U. Frankfurt, Germany). *FEBS Letters* 9(5):274-276, 1970.

The sensitivity of *in vitro* alkylation of SH-groups in rat liver mitochondria to oligomycin and ADP was investigated. Reactivity of the mitochondrial SH groups in the presence of oligomycin was decreased (48 and 30%) when ^{14}C-N-ethylmaleimide (10 μM and 5 μM, resp.) was added to KCN-inhibited, ATP-supported mitochondria. The rate of swelling caused by 10 μM ^{14}C-N-ethylmaleimide was decreased by the addition of oligomycin; at 5 μM, the rate of swelling was greater in the presence than in the absence of oligomycin. In the presence of ADP there was an increase in reactivity of the membrane SH-groups (19 and 33% at 10 μM and 5 μM ^{14}C-N-ethylmaleimide, resp.) together with an inhibition of swelling. This change in reactivity of the mitochondrial membrane sulfhydryl groups in the presence of ATP and Mg^{++} or ADP apparently is an indication of a conformational change in the mitochondrial membrane proteins.

7130 EFFECT OF ALLOPURINOL ON IRON MOBILIZATION.

(E.) Grace, N. D. (Lemuel Shattuck Hosp., Boston, Mass.), M. A. Greenwald and M. S. Greenberg. *Gastroenterology* 59(1):103-108, 1970.

Xanthine oxidase activity (determined by a modified spectrophotometric method of Kalckar), nonheme hepatic iron stores (determined colorimetrically after reduction by mercaptoacetic acid), and hematocrits and serum uric acids were determined in rats on normal, low iron, and high iron followed by low iron diets with and without allopurinol (0.05% in the water supply). The low iron diet had no effect on serum uric acid or on xanthine oxidase but caused a greater fall in hematocrits (down 18.8 compared to 1.7) decreased serum iron (95.2 to 39.7 μg/100 ml), and decreased total nonheme hepatic iron stores (5.12 to 1.72 mg/liver). Allopurinol did not significantly alter the hematocrits, serum iron, or nonheme iron stores of animals on normal or low iron diets, but serum uric acid dropped from 1.58 to 0.08 mg/100 ml with normal diets and from 1.64 to 0.07 mg/100 ml with low iron diets, and xanthine oxidase dropped from 11.7 to 2.0 with normal and from 13.1 to 3.5 Δ OD/min/g liver with low iron diets. In the rats that were iron-loaded before being placed on the low iron diet the only significant difference between the allopurinol group and controls was in the serum uric acid levels (0.77 for controls and 0.06 mg/100 ml for the allopurinol group). The nonheme hepatic iron store content of these animals (6.08 g for controls and 6.27 g for allopurinol) were consistently lower than the levels in iron-loaded animals before being placed on a low iron diet (7.22 g) suggesting that rats on a low iron diet mobilize iron from their livers although allopurinol has no effect on the rate of mobilization.

7131 POSITIVE INCREASE OF REDOX POTENTIAL OF THE EXTRAMITOCHONDRIAL NADP(H) SYSTEM BY MIXED FUNCTION OXIDATIONS IN HEMOGLOBIN-FREE PERFUSED RAT LIVER.

(E.) Sies, H. (Inst. Physiol. Chem. Phys. Biochem., U. Munich, Germany) and M. Kandel. *FEBS Letters* 9(4):205-208, 1970.

Changes in indicator metabolite couples and in tissue levels of the NADPH/NADP$^+$ and NADH/NAD$^+$ systems during mixed function oxidations were studied during perfusion of the liver with bicarbonate-buffered salt solution in rats with sodium phenobarbital-induced proliferation of hepatic microsomal mixed function oxidase activity. As indicated by the malic enzyme system, a potential change to the positive occurred in the extra-mitochondrial free NADPH/NADP$^+$ system, and as indicated by the lactate dehydrogenase system, no potential change occurred in the cytosolic free NADH/NAD$^+$ system. Coordination of these systems via the common reactant, pyruvate, was observed. The potential of the cytochrome P-450 system, tentatively calculated from degrees of reduction measured by absorbance photometry of perfused liver, shifted substantially to the negative.

7132 STUDIES ON THE METABOLISM OF STEROIDS IN THE FETUS: BIOSYNTHESIS OF 3-HYDROXY-Δ^4-C_{19} STEROIDS IN THE HUMAN FETAL LIVER.

(E.) Lisboa, B. P. (Karolinska Inst., Stockholm, Sweden) and J. A. Gustafsson. *Europ J Biochem* 14(3):556-559, 1970.

The biosynthesis of 3-hydroxy-Δ^4-C_{19} steroids in the human fetal liver was investigated by thin-layer and gas chromatography. After incubation of testosterone (5 mg) with the 105,000 x g supernatant fraction, 2 androstenediols were isolated (compounds I and II). After incubation of testosterone with the 105,000 x g microsome fraction, compound I and 6β-hydroxytestosterone were found in the zone 6.5-7.5 cm from the starting line (mobility of testosterone 7.9 cm). When incubated with liver slices, testosterone was metabolized to 6β-hydroxytestosterone and compound I (mobility 8.0-10.0 cm), 4 androstene-3,17-dione and 2 mono-oxomonohydroxy androstene derivatives (compounds III and IV; mobility 6-8 cm). The silyl ethers of compounds I and II gave mass spectra identical with those of 4-androstene-3α(and β),17β-diol silyl ethers, hence compounds I and II were identified as 4-androstene-3α (and β),17β-diol, resp. Gas chromatography allowed the identification of compounds III and IV as 3α-and 3β-hydroxy-4-androsten-17-one, resp.

7133 BIOCHEMICAL SITE OF REGULATION OF BILE ACID BIOSYNTHESIS IN THE RAT. *(E.)* Shefer, S. (Publ. Hlth. Res. Inst., New York, N. Y.), S. Hauser, I. Bekersky and E. H. Mosbach. *J Lipid Res* 11(5):404-411, 1970.

The site of regulation of bile acid biosynthesis was investigated in rats with bile fistulas. The intraduodenal infusion of taurocholate (11-14 mg/100 g/hr) inhibited the incorporation of acetate-1-^{14}C,mevalonolactone-2-^{14}C, and cholesterol-4-^{14}C into bile acids by approximately 80, 87, and 93%, resp. When 7-α-hydroxycholesterol-4-^{14}C was used as the labeled precursor (7 μg/hr), following excretion of the pool (taurocholate pool 16.1 mg/100 g; total bile salt pool 17.4 mg/100 g), endogenous bile salt production was maintained at an inhibited level for 60 hr by intraduodenal infusion of sodium taurocholate (14mg/100 g/hr). However, the incorporation of 7-α-hydroxycholesterol-4-^{14}C into bile salt was inhibited only 11% during the infusion. Apparently the regulation of bile acid biosynthesis is exerted via cholesterol 7α-hydroxylase only when hepatic cholesterol synthesis is adequate.

7134 PLASMA DISAPPEARANCE AND BILIARY EXCRETION OF SULFOBROMOPHTHALEIN AND PHENOL-3,6-DIBROMPHTHALEIN DISULFONATE AFTER MICROSOMAL ENZYME INDUCTION. *(E.)* Klaasen, C. D. (Kansas Med. Ctr., Kansas City). *Biochem Pharmacol* 19(4):1241-1249, 1970.

The ability of various microsomal drug metabolizing enzyme inducers to enhance the plasma disappearance and biliary excretion of BSP and phenol-3,6-dibromphthalein disulfonate was compared to the ability of these agents to increase biliary flow. Phenobarbital (75 mg/kg) treatment produced the greatest increase in biliary flow (control, 68 μl/min/kg; treatment, 99 μl/min/kg) and also had the greatest effect in enhancing the plasma disappearance and excretion of BSP and phenol-3,6-dibromphthalein disulfonate (control,1.25; treatment, 1.80 mg/min/kg for BSP) into the bile. With chlordane (50 mg/kg), phenylbutazone (125 mg/kg), nikethamide (150 mg/kg) and chlorcyclizine (25 mg/kg) treatments, no statistically significant changes in biliary flow were produced prior to dye administration. These agents produced a significant decrease in the plasma concentration of BSP or phenol-3,6-dibromphthalein disulfonate only at the 30 min sample and elicited a slight increase in the excretion of these 2 dyes into the bile. No direct correlation between the ability of these agents to induce rates of drug metabolism and the ability to enhance the disappearance of these dyes seemed to exist; the ability of these agents to increase biliary flow in rats appears to be related to their ability to increase the plasma disappearance and biliary excretion of BSP and phenol-3,6-dibromphthalein disulfonate.

7135 RESPONSE OF HEPATIC GLUCOKINASE AND GLUCOSE-6-PHOSPHATASE ACTIVITIES IN JUVENILE AND ADULT HYPERTHYROID MICE. *(E.)* Winnick, S. (Dept. Zool., California St. Coll., Los Angeles). *Endocrinology* 87(1):124-128, 1970.

The effects of triiodothyronine (0.03, 0.30, 3.0 μg/day, i.p.) on hepatic glucokinase and glucose-6-phosphatase activities were studied in juvenile and adult male mice. In hyperthyroid mice (lower triiodothyronine dose) glucokinase activity (control 0.55; treatment 1.4 U/min) increased and glucose-6-phosphatase activity (control 10; treatment 5.9 U/min) decreased when compared to controls. Hyperthyroid mice had greater hepatic glucose phosphorylating activity than euthyroid mice, indicating a probable greater capacity for glucose utilization than production (related to dephosphorylating activity). The hepatic enzyme responses to triiodothyronine in juveniles were greater than in adults. Thyroid hormone action may be similar to actions of glucocorticoids and growth hormone in gluconeogenic pathways up to the level of glucose-6-phosphate and, in addition, thyroid hormone may have a calorigenic action based on its capacity to increase glucose oxidation.

7136 ASPARAGINASE ACTION: INHIBITION OF PROTEIN SYNTHESIS IN RAT LIVER MITOCHONDRIA AND MICROSOMES AND BRAIN MITOCHONDRIA AND INHIBITION OF GLYCOPROTEIN SYNTHESIS IN LIVER AND BRAIN MITOCHONDRIA BY ASPARAGINASE. *(E.)* Bosmann, H. B. (Sch. Med. Dent., U. Rochester, N. Y.). *Life Sci* 9(15):851-859, 1970.

Rat liver mitochondria and microsomes and brain mitochondria were used to study the effect of asparaginase on protein and glycoprotein synthesis. RNase at 50 mg/ml had no effect on the mitochondrial macromolecular synthesis but inhibited the microsomal protein synthesis to less than 10%, whereas the addition of asparaginase inhibited protein and glycoprotein synthesis in each of the systems studied. The inhibition was most marked for the protein synthesis in liver mitochondria and microsomes and glycoprotein synthesis in the liver mitochondria. The highest concentration of asparaginase (33 mg/ml) was a concentration approximately equivalent to a 50% inhibition for each of the macromolecular synthesizing systems, and at 10^{-3} mg/ml asparaginase had virtually no effect on any of the macromolecular synthesizing systems studied.

7137 FURTHER STUDIES ON THE EFFECTS OF VARIOUS *IN VIVO* AND *IN VITRO* FACTORS ON THE PRIMING AND TEMPLATE ACTIVITIES OF DNA ISOLATES IN THE DNA AND RNA POLYMERASE SYSTEMS. *(E.)* Chmielewicz, Z. F. (St. U. New York, Buffalo Sch. Pharm. Med.), J. L. Ambrus and T. J. Bardos. *Cancer Res* 30(4):952-959, 1970.

The relation of previously reported increased priming activity of DNA isolated from neoplastic tissues to the rate of mitosis was investigated in nonmalignant regenerating tissues. No significant differences in priming activity was observed between the DNA isolates derived from the livers of rats sacrificed 24, 30, 48, and 72 hr following partial hepatectomy, as compared to the nonregenerating rat liver DNA controls (sham operation) as well as to the "standard" (calf thymus) DNA. The same DNA isolates were tested for template activity in the *Micrococcus lysodeikticus* RNA polymerase system, and no differences were found as compared to the DNA from normal rat liver. Calf thymus DNA which had been treated with pancreatic DNase (0.8-8.0 U/mg DNA) and reisolated by the original procedure exhibited the same priming activity in the DNA polymerase system as the untreated DNA standard. The priming activity of isolated DNA appears not to be related to the mitotic rate of the tissue of origin or to the DNase present in that tissue.

7138 RELATION OF DIETARY CHOLINE AND METHIONINE TO PHOSPHOLIPID SYNTHESIS IN THE RAT. *(E.)* Haggard, J. H. (Agric. Exp. Station, Auburn U., Ala.) and P. F. Parks. *J Nutr* 100(8):965-972, 1970.

The incorporation of choline-1,2-^{14}C, choline diphosphate-choline-1,2-^{14}C, and S-adenosyl-L-methionine-methyl-^{14}C into phospholipids of hepatic tissue from male weanling rats fed a basal diet deficient in choline and limited in methionine was compared to the incorporation in rats fed the basal diet plus 0.3% choline and/or 1% methionine. In 3 separate experiments the incorporation of choline-1,2-^{14}C (dpm/mg phosphorus) was significantly decreased when choline was added to the basal diet (basal diet incorporation 960, 1274, and 931; basal diet plus choline 401, 203, and 172; basal diet plus choline and methionine 88, 185, and 187), but methionine apparently did not affect incorporation (basal diet plus methionine 1452, 1325, and 990). *In vitro* studies indicated that incorporation of choline into phospholipids was not affected by the addition of a 100,000 x g cellular supernatant obtained from rats fed the choline supplemented diet, but incorporation of methyl groups from S-adenosyl-L-methionine-^{14}C dropped (9952 to 8991 dpm/tube). Combining supernatants and microsomal fractions from choline deficient and choline supplemented animals indicated that the supernatant of choline supplemented animals inhibits the methyl incorporation, and dialysis of this supernatant before addition to the system removed the effective component.

7139 LIPID METABOLISM IN THE PERFUSED CHICKEN LIVER: LIPOGENESIS FROM GLUCOSE, ACETATE AND PALMITATE. *(E.)* Bickerstaffe, R. (Unilever Res. Lab., Sharnbrook, England), C. E. West and E. F. Annison. *Biochem J* 118(3):427-431, 1970.

Hepatic lipogenesis from glucose, acetate and free fatty acids was investigated in the perfused chicken liver. Livers from fed and starved chickens showed a considerable capacity to incorporate albumin-bound 9,10-$^3H_2$-palmitate (170 µC) into triglycerides (49.5 and 25.3%, resp. in 1 animal), but appreciable lipogenesis from U-^{14}C-glucose (60 µC) was observed only with livers from fed birds (fed, 13.8%; starved, 0.3% for 1 animal). Considerable amounts of the triglyceride synthesized in the liver from both ^{14}C-glucose and $^3H_2$-palmitate were released into the perfusate. With livers from fed birds, the rate of glucose uptake was dependent on the concentration in the perfusate, but a similar correlation was seen in the livers from starved birds. Two hr after the introduction of L(+)-U-^{14}C-lactate (50 µC) less than 10% of the added radioactivity was present as lactate, and about 20% of the radioactivity was accounted for as glucose. Rapid glycogenolysis occurred during every perfusion with glycogen contents at the end of the perfusion rarely exceeding 0.2% (w/w). The livers from fed chickens showed a greater capacity for triglyceride synthesis (14.6 and 9.3%) from 1-^{14}C-acetate (50 µC) than did the starved livers (1.6 and 1.5%). Acetate concentrations in the perfusate remained relatively constant at 0.3-0.5 mmole/l in all experiments,suggesting continuous production by the liver.

7140 THE LIMITING RATE OF CHELATION OF LIVER ALCOHOL DEHYDROGENASE. *(E.)* Gilleland, M. J. (Henry Ford Hosp., Detroit, Mich.) and J. D. Shore. *Biochem Biophys Res Commun* 40(1):230-235, 1970.

The interaction of horse liver alcoholic dehydrogenase with chelating agents was investigated by stopped-flow techniques in an attempt to define the role of zinc in the binding of coenzymes and substrates. Stopped-flow measurements were made of the binding rate of bipyridyl to alcohol dehydrogenase at 308 nm. A plot of reciprocal pseudo first-order rate constants vs reciprocal bipyridyl concentrations resulted in a rate constant of 228 sec^{-1} at extrapolated infinite bipyridyl concentrations. A similar plot was obtained from stopped-flow measurements of the binding rate of pyrazole to alcohol dehydrogenase-NAD$^+$ complex which resulted in a rate constant of 238 sec^{-1}. Since most chelation reactions are slower than would be expected for diffusion-limited rates, chelation probably consists of 2 steps, the first being the formation of an outersphere complex in a rapid equilibrium, and the second and rate-determining step being the loss of a solvent molecule from the first hydration sphere of the metal ion. A rate-limiting step in the chelation of the zinc of alcohol dehydrogenase involving the displacement of a water molecule from the first hydration sphere of zinc with a rate constant similar to that of pyrazole binding indicated that the liver alcohol dehydrogenase-NAD$^+$-pyrazole complex involves zinc.

7141 THE EFFECTS OF THIOLS ON CHOLESTEROL SYNTHESIS BY RAT LIVER *IN VITRO.*

(E.) Hornby, G. M. (Edinburgh U. Med. Sch., Scotland), F. D. Onajobi and G. S. Boyd. *Biochem Biophys Res Commun* 40(3):524-529, 1970.

Thiols (7-15 mM) such as β-mercaptoethylamine, β-mercaptoethanol, ethanethiol and dithiothreitol inhibited cholesterol synthesis from mevalonic acid in rat liver with accumulation of a mixture of lanosta-8,24-dien-3β-ol (lanosterol) and lanost-8-en-3β-ol (Δ^8-lanostenol). Glutathione and cysteine had similar effects in inhibiting cholesterol synthesis at concentrations of 15-20 mM, but lanosterol and Δ^8-lanostenol did not accumulate. Since ethylamine (0.6-12 mM) had no effect, the thiol group of β-mercaptoethylamine appears to be essential for inhibition. That β-mercaptoethylamine and other thiols have an inhibitory effect on demethylation suggests that the initial step in lanosterol demethylation may be predominantly radical in nature.

7142 THE EFFECT OF GLUCOSE AND OF A TREATMENT BY GLUCOCORTICOIDS ON THE INACTIVATION *IN VITRO* OF LIVER GLYCOGEN PHOSPHORYLASE.

(E.) Stalmans, W. (Lab. Chem. Physiol., U. Louvain, Belgium), H. DeWulf, B. Lederer and H. G. Hers. *Europ J Biochem* 15(1):9-12, 1970.

The effect of glucose and glucocorticoids on the inactivation *in vitro* of mouse liver glycogen phosphorylase was investigated. The addition of glucose (0.5%) to a liver Sephadex filtrate caused a 5-10 fold increase in the rate of inactivation of phosphorylase; this inactivation was reversed by the addition of ATP, magnesium, and cyclic AMP, and completely inhibited by 0.1 M NaF, showing that the inactivation was due to the action of phosphorylase phosphatase. The effect of glucose on the inactivation of phosphorylase (Km = 7.2 mM) proceeded without a latency period and appeared to be a stimulation of the phosphatase rather than a conversion of an inactive into an active form. Following prednisolone (3-5 hr before sacrifice), the inactivation of liver phosphorylase, measured in a Sephadex filtrate, was 3-10 times faster than in a control preparation. Apparently, the concentration of blood glucose, by controlling the activity of phosphorylase phosphatase, plays an important role in the regulation of glycogen degradation.

7143 RENAL AND HEPATIC INACTIVATION OF ANGIOTENSIN IN RATS: INFLUENCE OF SODIUM BALANCE AND RENAL ARTERY COMPRESSION.

(E.) Leary, W. P. P. (Radcliffe Infirm., Oxford, England) and J. G. G. Ledingham. *Clin Sci* 38(5):573-582, 1970.

The rates of inactivation of asparagine^{1}valine^5 angiotensin II by isolated perfused rat liver and kidney were investigated in a variety of experimental conditions. After 6 min of perfusion the livers of animals given 1 mEq of sodium per day inactivated 376 ng (range = 230-558 ng) angiotensin II; the results were the same in rats given 1% NaCl solution to drink. Livers of sodium-depleted animals inactivated 322 ng of the peptide, not significantly different from their sodium replete controls (mean 298 ng). In contrast to findings in the liver, the amount of peptide destroyed at 6 min was reduced by almost 50% in those animals which had drunk 1% saline and even more in those given 2% saline. No significant difference between the rates of inactivation of angiotensin by kidneys with clipped renal arteries and intact renal arteries was seen. The kidneys contralateral to those with the arterial clip, on the other hand, destroyed considerably less peptide. The isolated rat liver inactivated angiotensin II amide at rates unaltered by renal artery constriction.

7144 THE EFFECT OF RAISING THE NAD$^+$ CONTENT ON THE PATHWAYS OF CARBOHYDRATE METABOLISM AND LIPOGENESIS IN RAT LIVER.

(E.) Lagunas, R. (Middlesex Hosp. Med. Sch., London, England), P. McLean and A. L. Greenbaum. *Europ J Biochem* 15(1):179-190, 1970.

The effect of raising the NAD$^+$ content (50 mg/100 g) on the pathways of carbohydrate metabolism and lipogenesis in rat liver was investigated. Increased activities of phosphofructokinase (mass action ratio 0.069 to 0.170 and 0.210 at 4 and 6 hr after nicotinamide administration), glyceraldehyde-3-phosphate dehydrogenase (28.7 to 32.3 and 26.0 at 4 and 6 hr, resp.) and pyruvate kinase (8.03 to 11.42 and 10.45 at 4 and 6 hr, resp.), as shown by the application of the cross-over theorem, indicated that these enzymes may be sites of metabolic control. The increased hepatic content of NAD$^+$ (control 0.746; treatment at 4 hr 1.567, at 6 hr 2.147 μmole/g wet wt) was accompanied by an increase of free oxidized to reduced nicotinamide nucleotides in the cytoplasm and mitochondria (control 5.33; treatment at 4 hr 8.58, at 6 hr 10.63 μmole/g wet wt), as calculated from the values of the intermediates, at both time intervals. The liver content of glucose-6-phosphate, citrate and malate were decreased (control 0.112, 0.404, 0.268, resp.; treatment 6 hr 0.066, 0.163, 0.170 μmole/g wet wt, resp.) by the treatment; the adenine nucleotides were unchanged, while the free CoA increased (0.161 to 0.299 μmole/g wet wt). Fatty acids were considerably increased 4 hr after nicotinamide (control 6.140; treatment 23.19 μmole/g wet wt) but were below control levels at 6 hr (3.61 μmole/g wet wt). The incorporation of 1-^{14}C and U-^{14}C-glucose into $^{14}CO_2$ was not changed, but the incorporation of 6-^{14}C-glucose, 2-^{14}C-pyruvate and 2-^{14}C-acetate into $^{14}CO_2$ were all increased. The incorporation of all labeled substrates into ^{14}C labeled lipids was inhibited at both 4 and 6 hr after nicotinamide administration. The increased activity of the tricarboxylic acid cycle was apparently due to the more oxidized state of the mitochondrial nicotinamide nucleotides.

7145 REGULATION OF NUCLEAR DNA SYNTHESIS IN RAT LIVER.

(E.) Hyodo, M. (Japanese Found. Cancer Res., Tokyo) and T. Ono. *Exp Cell Res* 60(3):401-404, 1970.

DNA synthesis in isolated nuclei of livers of partially hepatectomized rats were examined to clarify the mechanism of regulation of nuclear DNA synthesis.

Nuclei prepared in a hypertonic sucrose solution from normal liver, regenerating liver or tumor 5123D incorporated ^{3}H-thymidine triphophate into an acid-insoluble fraction linearly as long as 60 min in the presence of ATP, and all of the incorporated ^{3}H-thymidine triphosphate became rapidly acid-soluble after addition of 20 μg DNase per tube at 37°C. Nuclei from normal liver prepared in hypertonic solution showed as high a rate of incorporation as those of regenerating liver and tumor. Homogenates or crude nuclei of regenerating liver did not incorporate ^{3}H-thymidine triphosphate, but when the crude nuclei of normal liver was further homogenized and sedimented in hypertonic sucrose solution, the nuclei showed a high rate of incorporation. When the thymidine triphosphate level of crude nuclei and the mixture which contained nuclei from normal liver prepared by hypertonic sucrose and the cytoplasmic fraction of normal liver were assayed, degradation of ^{3}H-thymidine triphosphate had occurred and was at the same level as in the homogenate. At 20 min the same amount of ^{3}H-thymidine triphosphate was incorporated into the reconstituted mixture of nuclei and cytoplasm as into nuclei without cytoplasm and then incorporation ceased. This profile was similar to the case of crude nuclei and homogenate of regenerating liver. Nuclear DNA synthesis *in vitro* in normal liver was activated by hypertonic sucrose solution, indicating that nuclear DNA synthesis in normal rat liver was repressed or in a masked state, which was not due to degradation of substrates during incubation.

7146 THE EFFECT OF GLUCOSE AND OF A TREATMENT BY GLUCOCORTICOIDS ON THE ACTIVATION *IN VITRO* OF LIVER GLYCOGEN SYNTHETASE. *(E.)*

De Wulf, H. (Lab. Chem. Physiol., U. Louvain, Belgium), W. Stalmans and H. G. Hers. *Europ J Biochem* 15(1):1-8, 1970.

The effect of glucose and glucocorticoids on the activation *in vitro* of mouse liver glycogen synthetase was investigated. Following the removal of glucose, AMP and other small molecules from mouse liver extract by filtration through Sephadex G-25, the activation *in vitro* of glycogen synthetase was much more rapidly attained in the presence of glucose or by pretreatment of the animals with prednisolone 3 hr before sacrifice due to a shortening of the lag period that preceded the activation of the synthetase. Like glucose, caffeine and nicotinamide shortened the lag period and were without action when this period was over. In the presence of 3-5 mM AMP, the activation of the synthetase was initiated without delay and was rapidly complete; magnesium acetate caused a further acceleration of the reaction. Glycogen, known to inhibit the conversion of synthetase *b* to synthetase *a*, was shown to prolong the lag period, opposing the effect of glucose by increasing the apparent Km of the activating system for the hexose from 7 mM to 11.4 mM. In the absence of sulfate and phosphate ions, the activation of glycogen synthetase leveled off at values that were only 25-50% of the activity obtained in the presence of these ions. Apparently glycogen synthetase phosphatase is initially present in the liver filtrate as a *b* enzyme, active only in the presence of AMP and magnesium; this *b* form may be converted into its active *a* homolog through the action of a synthetase phosphatase activating enzyme, which is more active after treatment with glucocorticoids and is stimulated by glucose, caffeine, and nicotinamide and inhibited by glycogen, AMP and fluoride.

7147 THE SYNTHESIS OF RIBOSOMAL-TYPE RNA BY ISOLATED RAT LIVER MITOCHONDRIA. *(E.)*

Fukamachi. S. (Dept. Biochem., McMaster U., Hamilton, Ontario, Canada), B. Bartoov, R. S. Mitra and K. B. Freeman. *Biochem Biophys Res Commun* 40(4):852-857, 1970.

The synthesis of ribosomal-type RNA by isolated rat liver mitochondria was marked by linear incorporation of ^{3}H-uridine triphosphate into RNA for 1 hr. This reaction was sensitive to actinomycin D, acriflavin, and ethidium bromide, partially sensitive to ribonuclease and insensitive to deoxyribonuclease (% of control, 11.2, 15.4, 38.2, 82.6, and 98.9, resp.). The lack of sensitivity of mitochondrial RNA synthesis to ribonuclease and deoxyribonuclease clearly differentiates this from RNA synthesis by nuclei (% of control 11.7, 25.2, resp.); the sensitivity to antibiotics apparently indicates a DNA-dependent synthesis of RNA by mitochondria. The extracted RNA showed about 90% of the counts at about 4S and 10% in the 9-30 S region; the higher molecular RNA was characterized by 2 major peaks with mobilities of 20.5 S and 11.5 S (referred to as 21 S and 12 S resp.). A smaller peak at 28 S and a considerable amount of heterodisperse RNA was also observed. The synthesis of 21 S, 12 S and heterodisperse RNA was depressed 70% by ethidium bromide (0.33 μg/ml) in the incubation medium, similar to that found for the synthesis of total RNA.

7148 CONVERSION OF GLUCOSE-U^{14}C TO ^{14}CO$_2$, ^{14}C-GLYCOGEN, AND ^{14}C-FATTY ACIDS IN PARTIALLY HEPATECTOMIZED RAT. *(E.)*

Neville, E. D. (Ames Res. Ctr., NASA, Moffett Field, Calif.), K. S. Talarico and D. D. Feller. *Proc Soc Exp Biol Med* 134(2):372-379, 1970.

The conversion of glucose-U-^{14}C to ^{14}CO$_2$, ^{14}C-glycogen, and ^{14}C-fatty acids in the partially hepatectomized (67%) rat was investigated by radiorespirometry and chemical assay. Upon partial hepatectomy plasma free fatty acids increased (1,425 μEq/l; control 1,333 μEq/l) while glucose and cholesterol decreased (80-89 mg/100 ml, 36 mg/100 ml; control 129 mg/100 ml, 54 mg/100 ml, resp.). The partially hepatectomized rats showed a significantly decreased production of ^{14}CO$_2$ during the first hour of the radiorespirometry period; however, no significant difference between the partially hepatectomized rats and sham-operated controls was noted at the end of the 3 hr radiorespirometry period. The specific activity of muscle glycogen was decreased 1-2 days in the partially hepatectomized rats while liver glycogen showed an increase indicating that the turnover of muscle glycogen was decreased while the turnover of liver glycogen was increased. The recovery of liver ^{14}C-fatty acids (1024 dpm/g liver, control 2820 dpm/g liver) and nonsaponified ^{14}C-lipid was decreased, indicating that a decreased conversion of glucose to acetyl CoA occurs in the partially hepatectomized rat.

7149 THE EFFECT OF CELL-SAP FRACTIONS ON INCORPORATION OF AMINO ACIDS INTO PROTEIN IN RAT LIVER CELL-FREE SYSTEMS.

(E.) Liew, C. C. (Sch. Biol. Sci., U. Sussex, Falmer, England) and A. Korner. *Canad J Biochem* 48(7):735-739, 1970.

The efficiency of protein synthesis in polysome cell-free systems of rat liver containing cell sap, pH 5 enzyme preparation, partially purified transfer factors I and II, or a mixture of the factors was monitored by ^{14}C-phenylalanine incorporation. Incorporation of ^{14}C-phenylalanine into protein was greater in the ribosome-cell sap system than in the ribosome and pH 5 enzyme preparation, the ribosome and transfer factors I and II system, or in the system containing both pH 5 enzyme preparation and the transfer factors. A time course of ^{14}C-phenylalanine incorporation into protein carried out in the presence or absence of 19 unlabeled amino acids corroborated these findings. The optimal concentration of amino acids for protein synthesis in the cell-free system was between 0.5 mM and 1.0 mM but even in the absence of added amino acids, the cell sap was more efficient than the fractionated system. Incorporation of ^{14}C-phenylalanine into protein increased as the amount of transfer factors I and II added was increased, and also as the amount of added pH 5 enzyme preparation was increased. The greatest protein synthesis occurred when the ribosomes, transfer factors I and II and pH 5.2 enzyme preparation were present in a ratio 1:17.3: 4.3. At this ratio, the incorporation obtained was similar to that obtained with the ribosome-cell sap system. Incubation with cell sap produced changes in ribosomal profiles leading to less polysomes and more monomeric and dimeric ribosomes but no changes were noted on incubation with pH 5 enzyme preparation and transfer factors I and II.

7150 KINETIC AND IMMUNOCHEMICAL EVIDENCE FOR INDUCTION OF HEPATIC ADENOSINE MONOPHOSPHATE DEAMINASE BY 3'-METHYL-4-DIMETHYLAMINOAZOBENZENE OR THIOACETAMIDE.

(E.) Kizer, D. E. (Samuel Roberts Noble Found., Ardmore, Okla.), L. D. Smith and B. A. Howell. *Biochem Pharmacol* 19(4):1263-1276, 1970.

Crude 105,000 g supernatant fractions from rat liver homogenates were used in this study designed to determine whether increases in hepatic AMP deaminase activity after ingestion or injection of the hepatocarcinogens, 3'-methyl-4-dimethylaminoazobenzene or thioacetamide, were associated with increased enzyme or alterations in allosteric modulation. Kinetic and immunochemical studies indicated that increased AMP deaminase activity was associated with increased enzyme. The extent and nature of enzyme activity modulations by alkali metal ions and by certain mono-, di- or triphosphonucleotides were similar in enzyme from livers of both control and hepatocarcinogen-treated animals. When reaction mixtures contained ATP and alkali metal ions, plots of velocity vs substrate concentration were hyperbolic and activity of enzyme from hepatocarcinogen-treated animals always exceeded that of controls. Reaction of enzyme from control or hepatocarcinogen-treated animals with antibody to partially purified AMP deaminase from rat liver resulted in complete loss of enzyme activity, irrespective of source, but titration curves indicated higher antigen levels in supernatants from hepatocarcinogen-treated rats. Incubation of the supernatants at 55° resulted in losses of AMP deaminase activity with the losses among supernatants from carcinogen-treated animals occurring at rates nearly 3 times greater than losses from control supernatants, indicating that concomitant with induction of AMP deaminase by hepatocarcinogens, appreciable alterations in the physical properties of the enzyme had occurred.

7151 INCREASED SYNTHESIS AND INHIBITED BREAKDOWN DURING THE INCREASE OF MICROSOMAL CYTOCHROMES P-450 AND b-5 AFTER PHENOBARBITAL.

(Ger.) Greim, H. (Inst. Toxicol., U. Tubingen, Germany). *Naunyn Schmiedeberg Arch Pharmakol* 266(3):261-275, 1970.

The mechanism of enzyme protein multiplication in rat liver microsomes through phenobarbital treatment (80 mg/kg i.p. or 1% in drinking water) was investigated in normally fed and starved rats. ^{14}C-Aminolevulinic acid (5 μC/0.2 ml buffered saline i.v.) was used to label microsomal cytochromes; cytochrome P-450 increased up to 200% through induced synthesis, and up to 400% in starved rats both through induced protein synthesis and inhibition of breakdown. The ratio between microsomal cytochrome P-450 and liver homogenate cytochrome P-450 allowed calculation of the actual microsomal protein content of the liver homogenate which constituted 31% of the liver homogenate protein.

7152 CYCLOHEXIMIDE-RESISTANT AMINO ACID INCORPORATION INTO RAT LIVER MITOCHONDRIAL PROTEINS *IN VIVO*.

(E.) Beattie, D. S. (Mt. Sinai Sch. Med., City U. New York, N. Y.). *FEBS Letters* 9(4):232-234, 1970.

Mitochondrial preparations from rats injected with 40-50 μC of 4,5-^{3}H-L-leucine i.v. 2 min prior to sacrifice showed a 2.4-fold higher incorporation of radioactivity into the acetic acid-insoluble membranous protein than into the whole mitochondria; mitochondrial fractions from animals sacrificed 30 min after label injection were uniformly labeled. Cycloheximide (5 mg/100 g - enough to block 98% of microsomal protein synthesis) inhibited intact mitochondrial protein synthesis only 85% and mitochondrial membrane protein synthesis only 70%. Although it appears that about 30% of the mitochondrial membrane fraction was synthesized by a cycloheximide-insensitive system, most of the cytochrome oxidase labeled in the presence of cycloheximide was soluble, indicating that cytochrome oxidase is predominantly synthesized outside the mitochondrion.

7153 THE SYNTHESIS OF BILE ACIDS IN PERFUSED RAT LIVER SUBJECTED TO CHRONIC BILIARY DRAINAGE. *(E.)* Percy-Robb, I. W. (Med. Sch., U. Edinburgh, Scotland) and G. S. Boyd. *Biochem J* 118(3):519-530, 1970.

The effect of chronic biliary drainage on the synthesis of bile acids in perfused rat liver was investigated. Isolated rat liver, perfused with heparinized whole blood under physiological pressure, resulted in the secretion of bile at about the rate observed *in vivo*. The preparation remained metabolically active for 4 hr and was apparently normal in function and microscopic appearance. When the perfusate plasma and liver cholesterol pool were labeled by the introduction of 2-^{14}C-mevalonic acid (5 μC) the specific radioactivity of the perfusate cholesterol increased (28-35 cpm/μg at 4 hr); the biliary acids (cholic and chenodeoxycholic acids) were also labeled and had the same specific radioactivity. Perfused livers removed from rats immediately after, and 40 hr after, the start of total biliary drainage showed increased excretion rates of both cholic acid and chenodeoxycholic acid. The incorporation of 2-^{14}C-mevalonic acid or rat lipoprotein labeled with ^{14}C-cholesterol into bile acids was studied, and no relation was found between the mass of bile acid excreted and the rate of incorporation of ^{14}C perhaps due to the changing specific radioactivity of the cholesterol pool acting as the immediate bile acid precursor.

7154 EFFECT OF CHOLESTERYL ESTERS WITH DIFFERENT SATURATED FATTY ACIDS ON AMINOACYL-tRNA SYNTHESIS IN RAT LIVER. *(E.)* Hradec, J. (Oncol. Inst., Prague, Czechoslovakia) and J. Sommerau. *FEBS Letters* 9(3):161-162, 1970.

The effect of cholesteryl esters with different saturated higher fatty acids on aminoacyl-tRNA synthesis in rat liver was investigated. Esters of cholesterol with normal chain saturated fatty acids or iso-acids had no stimulating effect on charging of rat liver tRNA with L-leucine nor were they able to reactivate extracted pH 5 enzymes. From esters with anteiso-acids, only cholesteryl 13-methylpentadecanoate and 15-methylheptadecanoate, homologs of cholesteryl 14-methylhexadecanoate differing only in one methylene group, were active (net incorporation of ^{14}C-leucine 39.5, 40.3 and 40.2 pmoles, resp.). Furthermore, both these active cholesteryl esters showed the same typical dose-dependent reactivating effect on extracted pH 5 enzymes as demonstrated with cholesteryl 14-methylhexadecanoate (28.6, 29.1 and 29.3 pmole leucine incorporation, resp.). The chemical structure of the fatty acid is apparently of critical importance for the activity of cholesteryl esters in protein synthesis. Presence of a methyl group in the penultimate position in the saturated carbon chain of the fatty acid seems to be required for the activity of these esters.

7155 AN EFFECT OF GLUCOCORTICOID HORMONE ON THE NUCLEAR RIBONUCLEOPROTEIN OF RAT LIVER. *(E.)* Berg, T. (Dept. Zoophysiol. Pharmacol., U. Oslo, Norway), J. Morland and P. O. Seglen. *Hoppe Seyler Z Physiol Chem* 351(7):898-900, 1970.

Quantitative determinations of a specific nuclear ribonucleoprotein fraction were made in liver homogenates obtained from rats before and after *in vivo* treatment with glucocorticoid hormone. The nuclear extract obtained prior to treatment contained a characteristic component with a sedimentation coefficient of approximately 45S (as compared to a 53S ferritin marker, analysed in an analytical ultracentrifuge). The component was labeled *in vivo* in 15 min by a pulse of ^{14}C-orotic acid and had a uniform buoyant density of 1.35 g/cm^3 (CsCl). An i.p. injection of 4 mg of dexamethasone phosphate 4 hr prior to death caused no change in the total amount of RNA in the nuclei or nuclear extract but a significant decrease (13.5 ± 3.5%) in the quantity of 45S material was apparent (17 experiments). The 45S component probably represent ribonucleoprotein particles, and the transfer of these particles to the cytoplasm may be affected by glucocorticoids.

7156 STIMULATION OF NUCLEAR PROTEIN SYNTHESIS IN RAT LIVER AFTER PHENOBARBITAL ADMINISTRATION. *(E.)* Ruddon, R. W. (U. Mich. Med. Dent. Sch., Ann Arbor) and C. H. Rainey. *Biochem Biophys Res Commun* 40(1):152-160, 1970.

Protein synthesis was stimulated in subcellular fractions prepared from livers of rats given phenobarbital (75 mg/kg i.p.) prior to pulse labeling i.p. with leucine-^{3}H (58.2 C/mmole), arginine-^{14}C (237 mC/mmole), or arginine-^{3}H (881 mC/mmole). A 70% increase above control values in the labeling of microsomal protein and of a nuclear protein fraction extracted with 1 M NaCl in rats receiving a 40 min pulse of leucine-^{3}H 2 hr after phenobarbital administration was observed. When the same pulse was given 24 hr after phenobarbital administration, there was a 42% stimulation in the specific activity of microsomal protein but an 82% enhancement in the nuclear protein fraction compared to controls. Separation of the nuclear fraction on DEAE-cellulose columns indicated that there was a 5-fold stimulation in the specific activity of one of the protein peaks from the nuclear protein fraction of the liver of phenobarbital-treated rats, suggesting that phenobarbital administration enhanced the synthesis of various protein fractions in hepatic cells, and that these events may be involved in the enzyme induction produced by this drug.

7157 SELECTIVE REPRESSION OF BENZOATE OR TRYPTOPHAN MEDIATED INDUCTION OF LIVER TYROSINE AMINOTRANSFERASE BY PHENTOLAMINE IN ADRENALECTOMIZED RATS. *(E.)* Kato, K. (Sch. Med. U. Nagoya, Japan). *FEBS Letters* 8(6):316-318, 1970.

Benzoate or tryptophan mediated induction of liver tyrosine aminotransferase in rats was repressed by the i.p. administration of 7 mg phentolamine (or phenoxybenzamine, but not ergotamine or propranolol) at 0-3 hr after the inducer. Phentolamine did not repress the glucagon or hydrocortisone mediated induction of tyrosine aminotransferase and tryptophan pyrrolase, indicating that general protein synthesis was not inhibited by phentolamine. The mechanism

f benzoate or tryptophan mediated induction of
yrosine aminotransferase may include a cyclic AMP
ccumulating process which is sensitive to phentol-
mine, or phentolamine may release some endogenous
epressive substance.

158 RELATIONSHIP BETWEEN LIVER AMINOTRANSFERASE ACTIVITY AND ADRENAL CORTICAL
ORMONE METABOLISM IN TUMOR-BEARING RATS. *(E.)*

uga, S. (Nagoya, Japan), H. Mekata, T. Mizuno
nd Y. Kato. *Cancer Res* 30(4):1137-1141, 1970.

etabolic regulation in the catabolic or cachetic
tage was studied in ascites tumor-bearing rats.
iver L-alanine:2-oxoglutarate aminotransferase
ctivity, liver L-tyrosine:2-oxoglutarate amino-
ransferase activity, and adrenocortical hormone
etabolism were investigated sequentially after
.p. tumor inoculation. The activities of liver
lanine aminotransferase and tyrosine aminotrans-
erase were unchanged until the 14th day after
umor transplantation when a 2-fold and 1.8-fold
ncrease, resp., in these activities above control
alues were observed. Plasma corticosterone levels
ere elevated 70-80% above control levels from the
4th day after transplantation probably due to in-
reases in both adrenal weight and corticosterone
ontent in the tumor-bearing rats, since Δ^4-hydro-
enase activity in the liver remained unchanged
hroughout the period studied. Comparison of tu-
or-bearing rats with rats placed on a 3 day fast,
high protein diet, or a low protein diet showed
hat the metabolic abnormalities observed in tu-
or-bearing rats were different from the state of
utritional shift produced by various dietary
onditions.

159 EFFECT OF SERINE AND TYROSINE ON RAT LIVER ENZYMES AND GLYCOGEN CONTENT. *(E.)*

Liu,
. (Natl. Defense Med. Ctr., Taipei, Formosa), M. F.
in and J. S. Chen. *Chinese J Physiol* 20(3):183-188,
969.

nzyme and glycogen content determinations were made
n livers from rats sacrificed 6, 12 or 24 hr after
eceiving a diet containing serine, tyrosine, or an
quimolar mixture of serine and tyrosine at 0, 6
nd 12 hr, following a 24 hr fast. Hepatic water
nd nitrogen contents were approximately the same in
xperimental and control rats. Liver glycogen of the
ontrol rats (sucrose diet) increased very rapidly
p to the 12th hr (40 mg/g liver) and then declined
o 50% of the peak value. Serine and equimolar
erine-tyrosine mixture feedings increased glycogen
ontent more gradually than sucrose, with peak glycogen
f 40 mg/g liver reached at 24 hr with serine and
f 25 mg/g liver at 24 hr with serine-tyrosine; no
ignificant changes were noted in the tyrosine-fed
ats. Glucose-6-phosphatase declined after 6 hr in
he control and experimental rats except for the
yrosine-fed rats which showed an increase up to 12
r followed by a decline. Activities of SGOT, SGPT,
nd arginase in both tyrosine-fed and tyrosine-serine-
ed rats were higher than those in the sucrose-fed
ats, with tyrosine having a greater effect; activities
f these enzymes were depressed by serine.

7160 LIPID METABOLISM IN THE PERFUSED CHICKEN LIVER: THE UPTAKE AND METABOLISM OF OLEIC ACID, ELAIDIC ACID, *CIS*-VACCENIC ACID, *TRANS*-VACCENIC ACID AND STEARIC ACID. *(E.)*

Bickerstaffe, R. (Unilever Res. Lab., Sharnbrook, England) and E. F. Annison. *Biochem J* 118(3):433-442, 1970.

A study of the uptake and metabolism of ^{14}C- and ^3H-labeled cis-Δ^9-, trans-Δ^9-, cis-Δ^{11}- and trans-Δ^{11}-octadecenoic acids and octadecanoic acid by the perfused chicken liver showed no differences in the rates of uptake of the isomers. Considerable incorporation of radioactivity into triglycerides and phospholipids, and some release of labeled lipid into the perfusate was observed. Although the Δ^9-octadecenoic acids were incorporated to a greater extent than the Δ^{11}-isomers into triglycerides, the reverse was true with incorporation into phospholipids. The cis-fatty acids were more readily incorporated into triglycerides (trans-vaccenic acid/cis-vaccenic acid ratio 1.18) than phospholipids (same ratio 1.67). The intramolecular distribution of fatty acids into triglycerides showed that the trans-fatty acids and stearate occupied mainly the 1- and 3- positions while the cis-fatty acids occupied the 2- position. In the phospholipids, phosphatidylcholine and phosphatidylethanolamine, the trans-fatty acids again behaved like stearic acid and favored the 1- position. No atypical patterns of uptake or metabolism of the trans-fatty acids were observed.

7161 INDUCTION OF HEPATIC MITOCHONDRIAL FERROCHELATASE BY PHENOBARBITAL. *(E.)*

Hasegawa, E. (U. Michigan Med. Sch., Ann Arbor), C. Smith and T. R. Tephly. *Biochem Biophys Res Commun* 40(3):517-523, 1970.

The effect of phenobarbital on the induction of hepatic mitochondrial ferrochelatase in rats was investigated by spectrophotometry. When cupric ion or nickel was used in the reaction mixture, there was a marked inhibition of the formation of the pyridine hemochrome (52 and 67%, resp.) while no effect was observed using the cobalt assay (6 and 0%, resp.). Chronic phenobarbital treatment (60 mg/kg) did not increase hepatic mitochondrial ferrochelatase activity when the cobalt assay was employed, but when the activity was measured by the pyridine hemochrome formation, a 4-fold enhancement of activity was observed at 72 hr. This stimulation of ferrochelatase activity by phenobarbital was inhibited by the simultaneous administration (1 mg/kg and 2 mg/kg) of cycloheximide (control 0.13; phenobarbital 0.28; phenobarbital + cycloheximide 0.16 U/30 min), indicating that the effect of phenobarbital is mediated through an increase in protein synthesis.

7162 EFFECT OF DIPHENYLHYDANTOIN ON THE METABOLISM OF DEXAMETHASONE. *(E.)*

7191 POSTPRANDIAL pH AND NEUTRALIZING CAPACITY OF THE PROXIMAL DUODENUM IN DOGS. *(E.)* Grossman, M. I. (VA Ctr., Los Angeles, Calif.) and A. M. Brooks. *Gastroenterology* 59(1):85-89, 1970.

The pH of the contents of the duodenal bulb (within 2 cm of the pylorus) and of the midduodenum (15 cm from the pylorus) was continuously recorded with miniature glass electrodes positioned in metal cannulas in 3 dogs while fasting and after eating (meat meal with 22% protein, 5% fat, and 25% moisture). The mean fasting pH was 5.0 in the duodenal bulb (with considerable variation) and 6.2 in the midduodenum. In the duodenal bulb, the lowest mean postprandial pH of 3.4 occurred in the second 15 min period after feeding and rose gradually to the mean of 3.6, while in the midduodenum the early postprandial pH of 5.5 dropped gradually to the mean of 5.1. The titration curve of a 10 ml gastric content sample 3 hr after the meal was linear with a mean initial pH of 3.3 and required 1.38 mEq of NaOH to neutralize it to pH 7.0, while an *in vitro* 10 ml sample of gastric content incubated with the meat meal had an initial pH of 3.0 and required 1.56 mEq of NaOH to reach neutrality.

7192 PROSTAGLANDIN: LIBERATION FROM AND FORMATION IN PERFUSED FROG INTESTINE. *(E.)* Bartels, J. (Max Planck Inst. Exp. Med., Gottingen, Germany),

H. Kunze, W. Vogt and G. Wille. *Naunyn Schmiedeberg Arch Pharmakol* 266(3):199-207, 1970.

The role of phospholipase A and of certain fatty acids on prostaglandin formation and the release of prostaglandin was studied in the perfused frog intestine. The release of prostaglandin was highest at the beginning of the perfusion and then decreased from 100% to 69% in 40 min and ranged from 0.55 to 29 ng prostaglandin E_1 Eq/min. Following acetylcholine administration (10 µg/ml for 10 min) the prostaglandin output was increased (mean: control, 70 ng; treatment, 313 ng). A stimulation of prostaglandin release was also achieved by repeated injection of 1 µg dimethylphenylpiperazinium iodide (control 100 ng; treatment 165 ng); adrenaline had no definite effect. Prostaglandin output increased moderately (control 100 ng; treatment 154 ng) following lysolecithin injecttion (10 µg/ml) and remarkably after phospholipase A injection (control 15 ng; treatment 670 ng); the activity released by phospholipase A corresponded to prostaglandin E_1 as determined by thin-layer chromatography. On continuous infusion of arachidonic acid (1 µg/min for 20 min) the prostaglandin activity in the perfusate rose 5-fold (174 ng to 742 ng), but the activity released was due to prostaglandin E_2,not to prostaglandin E_1. A prostaglandin forming enzyme system active in the intact tissue appears to be responsive to physiological stimuli which may activate phospholipase A and provide free precursor acids.

7193 GAMMA GLUTAMYL CARBOXYPEPTIDASE (CONJUGASE), THE FOLIC ACID-RELEASING ENZYME OF INTESTINAL MUCOSA.

(E.) Bernstein, L. H. (Albert Einstein Coll. Med., Bronx, N. Y.), S. Gutstein and S. V. Weiner. *Amer J Clin Nutr* 23(7):919-925, 1970.

The effects of diphenylhydantoin, BSP, and dihydroxy and trihydroxy bile salts on gamma glutamyl carboxypeptidase (conjugase), the folic acid-releasing enzyme of the intestinal mucosa, were studied. The pH optimum of intestinal conjugase differed in guinea pig and man (6.1 and 5.3, resp.) in 0.1 M phosphate buffer. The distribution of conjugase in the guinea pig intestine revealed a low level of activity in the stomach (1500 U/hr), a higher level in the duodenum (3500 U/hr) and highest levels in the jejunum (5300 U/hr). Pancreatic conjugase activity was roughly the same as in the stomach. Diphenylhydantoin, in solution and in concentrations up to 500 µg/ml was not inhibitory to human intestinal conjugase in either of the buffers used (citrate-phosphate or phosphate). An 80% inhibition following BSP (200 µg/ml) and a 100% inhibition above a BSP concentration of 1,000 µg/ml was observed. *In vivo*, BSP interfered with the absorption of folic polyglutamate, but it did not prevent the absorption of crystalline folic acid. Both dihydroxy bile acids (deoxycholic acid and chenodeoxycholic acid) completely inhibited conjugase activity at levels of 1.5 µmoles/ml in the guinea pig mucosal preparations, but cholic acid was only 30% inhibitory even at 2 µmoles/ml. Incomplete inhibition of human conjugase by the dihydroxy bile salts was probably due to their precipitation at high concentrations at pH 5.3. Metabolite(s) produced by bacterial proliferation may lead to intestinal conjugase inhibition with resultant malabsorption of dietary folate which could account for the nutritional folate deficiency seen in tropical sprue.

7194 THE HORMONAL CONTROL OF BRUNNER'S GLAND SECRETION AND DUODENAL MOTILITY IN THE DOG.

(E.) Love, J. W. (Johns Hopkins U. Sch. Med., Baltimore, Md.), D. D. Bass, T. J. Ustach and M. M. Schuster. *J Surg Res* 10(9):395-403, 1970.

Hormonal control of Brunner's gland secretion in response to secretin and cholecystokinin-pancreozymin (CCK-PZ) stimulation was studied in proximal duodenal pouches of 3 dogs and 2 cats. Pure porcine secretin or natural porcine CCK-PZ (1 to 1.7 µg/kg/hr) were dissolved in volumes of up to 15 ml of 0.01 N HCl in 0.9% saline for i.v. infusion. Recordings were also made of pouch motility by embolectomy catheter attached to a pressure transducer and also using *in vitro* circumferential duodenal muscle strips. CCK-PZ produced a rapid peak response in duodenal secretion which was not sustained during infusion; secretin produced a sustained secretory response in both dog and cat. Fasting contractions (14 to 18/min) separated by 5 to 30 sec quiescent periods rose to 19 to 20/min after feeding. CCK-PZ (50 µg) caused a rapid burst of contractions which diminished in intensity after 50 sec of infusion while secretin (50 µg) did not affect either the strength or frequency of contractions. *In vitro* motility studies also revealed a vigorous contractile response to CCK-PZ but no response to secretin.

7195 EFFECT OF SECRETIN ON FASTING AND POSTPRANDIAL pH OF THE DUODENAL BULB IN DOGS. *(E.)*

Grossman, M. I. (VA Ctr., Los Angeles, Calif.) and A. M. Brooks. *Gastroenterology* 59(1):90-94, 1970.

The pH of the duodenal bulb contents (2 cm from the pylorus) was continuously monitored with a miniature glass electrode inserted through a metal cannula into the duodenum, and gastric acid and pancreatic bicarbonate outputs were measured in dogs before and after a commercial dog food feeding (Prime, General Foods Corporation) with and without the i.v. infusion of secretin (3 U/kg/hr). Secretin raised the mean fasti pH from 6.2 to 8.1, and the lowest postprandial pH from 2.9 to 3.8. No significant difference in the volume recovered from the gastric fistula 4 hr after the meal was seen with secretin infusion. The mean acid output from the Pavlov pouch in response to the meal was reduced 30% by secretin infusion, and the progressive rise of postprandial pancreatic bicarbonate output (mEq/15 min) to 1.0 in controls was increased to 4.2 with secretin.

7196 EFFECT OF HYPOPHYSECTOMY ON AMINO ACID, THYMIDINE, AND OROTIC ACID INCORPORATION INTO THE MUCOSA OF THE SMALL BOWEL.

(E.) Levitan, R. (West Side Hosp., Chicago, Ill.) and E. Havivi. *Canad J Biochem* 48(7):828-830, 1970.

The effect of hypophysectomy on the incorporation of tritiated thymidine and orotic acid into DNA and RNA, resp., and the incorporation of amino acids into protein by polyribosomes of the small intestinal mucosa of the rat was investigated. Hypophysectomy decreased incorporation of label into both DNA (control 815; treatment 400 dpm/mg) and RNA (control 470; treatment 290 dpm/mg). Hypophysectomy also reduced the incorporation of L-leucine-1-^{14}C into intestinal protein *in vitro* (control 4260; treatment 2978 dpm/mg). These decreases are probably related to diminished cell renewal and DNA synthesis.

7197 NONDISPLACEMENT OF RAT TISSUE RIBOFLAVIN BY 7-CHLORO-8-METHYL-FLAVIN AND THE STIMULATION OF INTESTINAL SYNTHESIS OF RIBOFLAVIN. *(E.)* Lambooy, J. P. (Sch. Med. U. Maryland, Baltimore), R. A. Scala and E. Homan. *J Nutr* 100(8):883-892, 1970.

Nondisplacement of weanling rat tissue riboflavin by 7-chloro-8-methyl-flavin and the stimulation of the intestinal synthesis of riboflavin were investigated. Riboflavin-deficient animals receiving 7-chloro-8-methyl-flavin excreted significantly more riboflavin in their urine and feces (1.49 µg/day) than deficient animals receiving water alone (0.50 µg/day). The excretion of riboflavin derived from tissue stores of labeled riboflavin was approximately the same for the above 2 groups (-0.38 and -0.35 µg/day, resp.). In riboflavin-deficient animals receiving 7-chloro-8-methyl-flavin, the average body content of total riboflavin increased (+28 µg) and the average body concentration showed a large decrease (0.93 µg/g), but in deficient animals receiving water alone, the average body content of total riboflavin fell slightly during the test period (-8 µg) and the average body concentration of the total riboflavin was not significantly altered during the test period. The urine of animals receiving the riboflavin analog contained material identified as flavin or flavin-like by ultraviolet light and by radioautography corresponding to riboflavin, riboflavin-5′-phosphate and an unknown metabolite at R_f 0.12 (riboflavin = 0.30).

7198 DECREASE OF DNA SYNTHESIS IN DUODENAL CRYPT CELLS OF RATS TREATED WITH Na_3(Ca-DTPA). *(E.)* Weber, K. M. (Inst. Radiobiol., Karlsruhe, Germany), F. Bohne and U. Rabe. *Europ J Pharmacol* 11(1):117-118, 1970.

11 RAPID SCREENING TEST FOR DETECTING HEPATITIS-ASSOCIATED ANTIGEN. *(E.)* Saravis, C. A. oston City U., Mass.), C. Trey and G. F. Grady. *ience* 169(3942):298-299, 1970.

technique, based upon Laurell's modification of ossed electrophoresis (but substituting a pre-rmed microporous cellulose acetate membrane for ar) which can be completed within 2 hr and is at ast as sensitive as the Ouchterlony technique for e detection of hepatitis associated antigen, was scribed. The cellulose acetate membrane (95 x 75 0.01 mm) saturated by 1 ml of diluted antiserum :16 was used in present study), was placed on a rafilm-covered neoprene rubber base which served compress the membrane snugly against a top cite template secured by bolts tightened evenly a torque wrench preset at 5 x 10^6 dyne/cm. A rrent of 6 ma (250 volts) was applied for 2 hr; e precipitates were revealed by staining. Anti-n was quantitated by measuring the migration stance of the cone of the rocket-shaped immuno-ecipitate. Specificity of the antiserum for an tigen in the sera of viral hepatitis patients s suggested by the lack of immunoprecipitation th serum samples from normal individuals and tients with other illnesses.

12 HYPOTONIC DUODENOGRAPHY. *(Fr.)* Engelholm, L. (Hosp. U. Brugmann, Brussels, Belgium), Mainguet, R. Kiekens and J. Struyven. *Acta Gastroent lg* 33(2):120-136, 1970.

potonic duodenography was performed on 150 patients 7 with normal and suspicious duodenal alterations, with pancreatic disease, 13 with papillary disease d 24 with various duodenal diseases) and compared standard radiological findings. Precise focusing duodenal involvement in 2 cases of pancreatitis s achieved where standard radiology was not efficient; ncreatic tumor was ascertained in 9 out of 10 cases the standard method while the 10th case was revealed ly by the new method. Early diagnosis of tumor of e papilla duodeni was possible due to the superior ality of radiological image.

13 ARTERIOGRAPHY IN PRIMARY LIVER TUMORS. *(E.)* Bennet, J. (Emile Roux Hosp. Ctr., ris, France). *Aust Radiol* 14(2):183-193, 1970.

teriographic examinations performed on 33 patients cluding 30 selective explorations of the celiac unk, one selective exploration of the superior senteric artery (after failure to catheterize the liac trunk) and 2 aortographies led to the diag-sis of 23 cases of hepatoma and confirmation of diagnosed cases. In 32 of the 33 cases a pri-ry malignant tumor was highly probable, and in e case which was investigated by non-selective teriography, the diagnosis was missed (a small mor giving rise to a subcapsular hematoma). The direct arteriographic signs showed the tumor mass isplacement of the celiac trunk) and its hyper-scularity which included an increase in the size the hepatic artery supplying the tumor, poor fill-g of the surrounding tissue, and an extra blood supply from the superior mesenteric artery. The direct arteriographic signs were apparent at the arteriolar and parenchymatous phases where disorganized vessels filled blood lakes in which there was stasis of the contrast medium, giving the tumor a markedly nonhomogenous appearance. Hepatic veins which did not empty due to compression by the tumor were found, as well as hepato-portal shunts suggestive of adenocarcinomas.

7214 TECHNICAL ADVANCES OF PANCREATIC SCANNING WITH A FAST SCANNER(DYNAPIX). *(Ger.)* Schnabel, K. (U. Radiol. Clin. Heidelberg, Germany), P. Schenk and D. Lange. *Nuclearmedizin* 9(2):129-135, 1970.

Pancreatic scanning performed in 101 patients (200-250 µC ^{75}S-methionine, i.v.) with a Dynapix fast scanner allowing picture taking every 12-15 min revealed maximal ^{75}Se accumulation in the organ within 30-75 min. A reliable image of the pancreas contour was obtained in 29% of 37 patients examined in horizontal position, with no preliminary treatment or special diet. The lower end of the table was elevated by 15° for 64 patients kept on their right side which allowed a good visualization of the organ in 36% of the cases. In doubtful cases an additional peroral image of the gastrointestinal tract was taken (100 µC ^{198}Au), keeping the patient in the same position, and, in case no differentiation between the pancreas and liver occurred, a liver scintigram was made (200 µC ^{198}Au i.v.). After appropriate image subtraction, the pancreas was visualized in 77% of cases. The results suggested that 2 out of 4 scintigraphic shapes (the sigmoid and the horse shoe), described in the literature, are artifacts caused by interference of the gastrointestinal tract.

7215 CHOLANGIOTOMOGRAPHY WITH BILIVISTAN: A FURTHER REPORT. *(E.)* Govoni, A. F. (Gen. Hosp., Sault Ste. Marie, Ontario, Canada). *Aust Radiol* 14(1):56-63, 1970.

In 100 unselected cases, Bilivistan was shown to be more advantageous in the degree of radiographic demonstration of the gallbladder and the common and hepatic bile ducts than either Biligrafin or p.o. cholecystographic agents. With Bilivistan (injected i.v. or i.m. 60 min prior to the first cholangiogram), there was satisfactory and simultaneous opacification of the gallbladder and its ducts as well as longer duration of the opacification of the extrabiliary system with no or minimal untoward reactions. Fewer radiographs are required even when tomographic studies are considered, thereby reducing the radiation exposure to the patient.

7216 ECHOGRAPHIC DIAGNOSIS OF PANCREATIC LESIONS: ULTRASOUND SCANNING TECHNIQUES AND DIAGNOSTIC FINDINGS. *(E.)* Filly, R. A. (U. Hosp. Cleveland, O.) and A. K. Freimanis. *Radiology* 96(3):575-582, 1970.

Thirty-seven patients with proven or suspected pancreatic diseases (acute pancreatitis, chronic pancreatitis with acute exacerbation, pancreatic pseudocyst, and carcinoma of the pancreas) were examined by echography. In 9/11 cases of pancreatitis the echogram demonstrated changes characteristic of pancreatic edema. In 6/7 cases, the pseudocyst was demonstrated pre-operatively by echography and echograms of 2/3 patients with suspected pseudocysts showed no evidence of pseudocysts (a finding subsequently verified at surgical exploration); the remaining case was a false positive due to a large accumulation of fat. In diagnosing carcinoma of the pancreas by echography, 3 cm lesions appeared to be the smallest that can be differentiated from surrounding structures. Of the 11 patients with suspected carcinoma of the pancreas examined, 6 had peripancreatic lesions (2 lymphosarcoma, 1 Hodgkin's disease, 1 carcinoma of the common bile duct, 1 carcinoma of the gallbladder, and 1 enlarged, hyperplastic lymph node). A mass could be shown echographically in all tumors except in the carcinoma of the common bile duct. Of the 5 cases without masses, the echogram was normal in 1, and correctly suggested pancreatitis in another. The remaining 3 cases were of advanced cirrhosis, each of which showed bizarre echographic abnormalities in the peripancreatic region, and 1 case strongly suggested a mass. Radioisotope and echo scans were generally in agreement.

7217 HYPOTONIC DUODENOGRAPHY. *(Fr.)* Yvergneaux, J. P. (Ghent, Belgium), W. Depuydt and M. Biot. *Acta Gastroent Belg* 33(2):173-178, 1970.

Hypotonic duodenography performed immediately following standard radiology (i.v. administration of a mixture of visceralgine and 0.5 mg atropine) allowed excellent focusing of duodenal lesions produced by pancreatic disease. However, drawbacks were observed when investigations were made at the duodenal bulb level of the ampulla of Vater, where images were unreliable. Complementary use of pancreas scintography is suggested at this level in cases of obstructive jaundice.

7218 RELATIONSHIP BETWEEN SULFOBROMOPHTHALEIN CLEARANCE AND Au^{198}CLEARANCE: SOME SCINTIGRAPHIC ASPECTS IN LIVER DISEASES. *(It.)* Maduli, S. (Maggiore Hosp. Novara, Italy) and G. L. Castagnetti. *G Clin Med* 51(3):180-253, 1970.

BSP clearance was compared to colloidal radioactive gold clearance (Au^{198}e.v. 1.5 μc/kg), radioisotope liver scanning (60 min after Au^{198} administration) and needle biopsy data in 12 normal subjects and 127 patients with liver disease. BSP clearance followed a simple exponential pattern (single stage) in normal subjects and varied between K=11.5% and 18.2%; colloidal gold clearance, K Au^{198}, varied between 13.9% and 24.4% and the ratio K BSP/K Au^{198} had a mean value of 0.82. BSP clearance occurred in two stages in all pathological conditions: in alcoholic steatosis (9 cases), K_1 BSP = 8.2% and K_2 BSP = 1.9%; in chronic hepatitis (26 cases, alcohol-induced), K_1 BSP = 5.6% and K_2 BSP = 1.4%; in liver cirrhosis (32 cases), K_1 BSP = 3.8% and K_2 BSP = 1.1%; in liver metastatic neoplasms (22 cases), K_1 BSP = 5.5% and K_2 BSP = 0.8%; and in cholelithiasis (17 cases), K_1 BSP = 7.1% and K_2 BSP = 0.7%. In the same order, colloidal gold clearance values were 17.0%, 14.0%, 6.0%, 16.7%, and 14.9% in cholelithiasis. The ratio K BSP/K Au^{198} was 0.48, 0.39, 0.66, 0.39 and close to normal in cholelithiasis in the same order. Liver scanning revealed considerable alterations in contour and dimensions with a decrease in liver surface in cirrhosis. Comparison of BSP clearance (parenchymal function) and colloidal gold clearance (Kupffer cell function and liver circulation), may allow the assessment of liver cell damage and liver circulatory alteration in the differential diagnosis of liver diseases.

7219 ANGIOGRAPHY AND SCANNING IN LIVER DISEASE. *(E.)* Rossi, P. (Cornell U. Med. Sch., New York, N. Y.) and H. R. Gould. *Radiology* 96(3):553-562, 1970.

The comparative accuracy of 1600 liver scans and 450 selective celiac or hepatic arteriograms was determined in 105 cases which had been examined by both diagnostic methods and in which a proved diagnosis had been obtained in 77 cases (26 cases of space occupying lesions, 35 cases of cirrhosis and 16 normals) by needle biopsy, laparotomy, or postmortem examination. Both arteriography and liver scanning were found to be complementary to each othe with the liver scan providing an excellent method of screening and arteriography giving more information and illustrating more and smaller intrahepatic lesio In the presence of cirrhosis, arteriography was neces sary to differentiate pseudotumors from true neoplas Angiography can show the hepatic anatomy prior to the intra-arterial chemotherapeutic perfusion of the live and may also show other areas of metastases when ves adjoining the celiac artery are injected.

7220 CORRELATION OF ANGIOGRAPHY AND ISOTOPE SCANNING IN ABDOMINAL DISEASES OF CHILDREN. *(E.)* Nebesar, R. A. (Harvard Med. Sch., Boston, Mass.), M. Tefft and R. M. Filler. *Amer J Roentgen* 109(2):323-340, 1970.

The advantages of performing and correlating angiography and isotope scanning in abdominal diseases in children (36) was investigated. The scan demonstrated an abnormality in all of the diseases studied (including primary hepatic malignancy 3, benign primary liver tumor 4 and radiation hepatitis 7); the angiogram was abnormal in all but 2 cases (radiation hepatitis and biliary atresia). There were no false positive interpretations by scan or angiogram. Three primary malignant hepatic tumors (2 hepato-cellular carcinomas and 1 hepatoblastoma) had abundant vascular supply, with angiography showing enlargement of the hepatic arteries with large feeding arteries and numerous small vessels within the lesion. Three metastatic lesions affecting the liver (1 Wilm's tumor, 1 paraganglioma, and 1 sarcoma) were less vascular than the primary hepatic tumors; all lesions showed decreased radioisotope uptake as contrasted with normal areas of the liver. Five masses which

ved extrinsic to the liver were inseparable from
ver by physical examination and routine roentgeno-
aphy but were noticed with angiography. Local
elling, opacification of the intrahepatic portal
in branches from the hepatic arteries, areas of
minished uptake, and areas of increased vascu-
rity in the liver were detected. In 1 case of
dominal injury hepatic angiography revealed a
calized arterial irregularity with a small false
eurysm in the same region.

21 DUODENAL EXFOLIATIVE CYTOLOGY: DUODENAL DRAINAGE SMEARS AFTER STIMULATION WITH
CRETIN. *(E.)* Asnaes, S. (Bispebjerg Hosp., Copen-
gen, Denmark) and A. Johansen. *Acta Path Microbiol*
ppl. 212):11-14, 1970.

imple method for aspiration of duodonal contents
an exfoliative cytological examination in cases
carcinoma of the pancreas and bile ducts was
vestigated. One hundred thirty-four cytological
aminations were carried out in 133 patients.
rteen smears showed positive cytology, 6 of which
vealed pancreatic cancer and 63 of which showed
rcinoma of the bile duct; in the remaining cases
carcinoma was found. The rest of the smears
owed a negative cytology (106), only one of which
bsequently was shown to have a carcinoma (pancreas).
e pancreatic tumors were always localized at the
ad of the pancreas, the bile duct carcinomas at the
stal part of the common bile duct. In the duodenal
pirate were seen duodenal cells, cells from the
cretory ducts of the pancreas and cells from the
le ducts. The epithelium of the duodenal cells
re slim, medium sized, cylindrical epithelial
lls with an oval nucleus in the lower half and a
minal striated border. The cells from the pancrea-
c ducts were also cylindric with round or oval
clei and often formed small, unconnected clusters.
striated borders were found here, but an occasional
blet cell was noticed. The cylindrical epithelium
the common bile duct, the gallbladder and the large
le ducts was very high and slender with small, oval
clei placed basally; no striated border or goblet
lls were found. All specimens contained a large
mber of strongly eosinophil, round or oval cells
ch one or more chromatin-like bodies, which had
parently undergone a considerable pyknosis. The
lignant cells have all been of the adenocarcino-
tous type and had no specific characteristics.

2 GASTRIC FLUORESCENCE LAVAGE METHOD FOR CYTODIAGNOSIS OF GASTRIC CANCER. *(E.)*
kenaka, M. (Tottori U. Sch. Med., Japan), S. Tanida,
Munakata, T. Takeuchi, Y. Sasaki and M. Ayabe.
nago Acta Med 14(1):27-32, 1970.

gastric fluorescence lavage method for cytodiag-
sis of gastric cancer employing acridine orange
in, allowed tumor cells to be easily distinguished
m benign cells by dense staining and brilliant
orescence. Morphologically, cancer cells had
ge, irregular nuclei, large nucleoli, and a marked
crease of nucleocytoplasmic ratio. Unfixed or
njured fresh cancer cells of the stomach showed
metachromasia and stained light green; cancer
cells of varying types of injury or fixed cells were diffusely stained and showed a metachromasia. Cytodiagnosis by the gastric fluorescence lavage method revealed 14 cases of benign gastric diseases and 20 cases of gastric cancer with a diagnostic accuracy of 95%.

GASTROINTESTINAL DISEASES

ESOPHAGUS

7295 POST-VAGOTOMY DYSPHAGIA. *(E.)* Edwards, D. A. W. (U. Coll. Hosp. Med. Sch., London, England). *Lancet* 2(7663):90-92, 1970.

Eight patients with post-vagotomy dysphagia were examined by radiology, esophagoscopy, and manometry. Symptoms began most commonly 7 to 14 days after operation and tended to come on abruptly. Attempts at eating or drinking commonly provoked pain within seconds of swallowing and pain continued until the bolus had either passed into the stomach or was regurgitated. Spontaneous improvement occurred after 3 weeks to 3 months. The characteristic radiological appearance of the esophagus with the patient standing after drinking barium was superficially similar to that seen in achalasia, that is, as a long stricture. By fluoroscopic monitoring of the course of a bolus swallowed in the 10° head-down position, the peristaltic wave was demonstrated in the body of the esophagus in the 7 patients screened and the maximum bore of the channel correlated with the severity of symptoms. In all patients, the lining of the lumen had a smooth surface without any suggestion of mucosal damage with esophagoscopy even when the lumen was firmly closed and the appearance of the mucosa was not compatible with the changes of post-intubation esophagitis. A manometric examination of the esophagastric junction in 3 patients revealed that innervation mediating both relaxation and contraction was intact and the muscle responded normally.

7296 THE JEJUNAL INTERPOSITION OPERATION: A FOLLOW-UP ON SEVENTEEN PATIENTS FOLLOWED 10 TO 17 YEARS. *(E.)* Moylan, J. P., Jr. (Brook Army Med. Ctr., Fort Sam Houston, Texas), J. W. Bell, J. R. Cantrell and K. A. Merendino. *Ann Surg* 172(2): 205-211, 1970.

A group of 17 patients (13 peptic esophagitis and stricture with or without hiatal hernia, 2 cardiospasm, 1 reflux esophagitis, 1 esophageal varices) who had been followed from 10 to 17 yr since having the jejunal interposition operation were reviewed. Because of dysphagia prior to the jejunal interposition operation, the entire group was limited to a soft or liquid diet, taken at various times during the day or night. Now 13 of the 16 patients had normal swallowing and ate regular diets in a normal pattern of 3 meals a day; the remaining 3 had slow but adequate deglutition. Dyspepsia, a significant pre-operative problem, was rarely experienced by most patients. Four of 6 patients who underwent esophageal fluoroscopy were not experiencing any difficulty, while the remaining 2 had slow but satisfactory swallowing, decreased jejunal peristalsis and poor tone. In all patients the barium bolus was forced in both directions at the esophago-jejunal junction and at the jejunogastric anastomosis when gastric contractions were noted; backward movement of the bolus was at maximum 8 cm. The jejunal interposition operation appears to have value because it represents a direct approach to the primary surgical need and gastro intestinal continuity is restored in a normal sequence.

STOMACH AND DUODENUM

7320 ULTRASTRUCTURE OF THE GASTRIC MUCOSA IN PATIENTS WITH ATROPHIC GASTRITIS AND PERNICIOUS ANEMIA. *(E.)* Weisberg, H. (New York Med. Coll., Flower-Fifth Avenue Hosp., New York) and S. F. Chiao. *Gastroenterology* 59(1):36-45, 1970.

The ultrastructure of the gastric mucosa in patients with atrophic gastritis (4) and pernicious anemia (3) was studied by electron microscopy. All gastric mucosal cell types in these specimens showed great variation in their ultrastructural appearance; however, no specific changes could be detected in the parietal cells, zymogen cells, mucous, or argentaffin cells of patients with atrophic gastritis and pernicious anemia which were not present in normals. Departures from the frequently described typical appearance of these cells included mitochondrial vacuolization, distribution of dense bodies of varying size, shape and density throughout the cytoplasm, apparent irregularity or absence of membranes, dilated endoplasmic reticulum and clumped nuclear chromatin. While infiltration of the lamina propria by wandering cells was more extensive in atrophic gastritis patients than in normal subjects and patients with gastric atrophy, there was no evidence of structural damage to glandular cells by wandering cells. The number of parietal cells and zymogen cells were decreased in patients with atrophic gastritis and were entirely absent in 2 patients with gastric atrophy. The gradual disappearance of parietal and zymogen cells from the gastric mucosa may be due either to the more rapid destruction of these cells by normal mechanisms, to a delay in their maturation and differentiation, or to a combination of these.

7321 DUODENITIS. *(Fr.)* Cheli, R. (Inst. Clin. Med., U. Genoa, Italy). *Acta Gastroent Belg* 33(2):110-119, 1970.

Duodenal biopsy revealed duodenitis in 66 out of 170 patients with dyspepsia, in 17 out of 52 patients with biliary tract diseases (cholecystitis, cholelithiasis), in 3 out of 11 patients with infectious hepatitis, in 8 out of 14 patients with chronic pancreatitis and in 2 out of 3 patients with lambliasis. Three cases of moderate duodenitis were detected among 52 subjects of the control group while 3 patients with duodenal diverticulosis and 42 with lower intestinal tract diseases (hemorrhagic rectocolitis, regional enteritis, amebic colitis, functional colon disorders, hemorrhoidal anorectitis) had a normal duodenal mucosa. Histologically, 3 varieties of duodenitis were established: superficial duodenitis, which occurred most frequently (54%) and was limited to the villous level; atrophic duodenitis (40%), where the inflammatory process extended to the whole bulk of the mucosa with marked alterations of the crypts of Lieberkühn; and interstitial duodenitis (6%), characterized by isolated infiltrations into the interstitial spaces around the lamina muscularis mucosae. Correlations between duodenitis and ulcers were indefinite since the inflammation of the mucosa was usually limited to the ulcerous region. Histological findings were confirmed by radiology in 83% of the patients.

7322 GROWTH HORMONE RESPONSE TO GASTRECTOMY. *(E.)* Mimura, T. (Sch. Med. Keio U., Tokyo, Japan), T. Akamatsu, S. Kodaira, M. Maruta and M. Uekusa. *Keio J Med* 18(4):229-236, 1969.

Plasma growth hormone levels (quantitation by a modification of the method of Schalch and Parker), blood sugar levels, and nonesterified fatty acid levels were determined in 34 patients with either peptic ulcer or gastric cancer before, during, and after gastrectomy. Plasma human growth hormone levels (ng/ml) averaged 2.82 on the morning of the operation, rose to 30.0 at 60 min after the commencement of surgery, and gradually declined to the preoperative levels after 4 to 6 hr. Peak levels of patients with cancer were higher (33) than those of patients with ulcers (28); peak levels of patients below 40 yr of age reached a maximum (23) 60 min after commencement of surgery and remained high for 2 hr while peak levels of patients over 60 reached a maximum (23) and immediately declined to preoperative levels. The sex of the patient apparently did not produce any significant differences. Obese subjects (10% over the standard weight as defined by Broca) showed a rapid growth hormone response peaking 15 min after the start of surgery while lean subjects exhibited peak levels after 60 min. Magnitude of surgical stress (1 hr vs 3 hr surgery) resulted in no marked differences in peak levels and recovery tendencies in both groups were similar. Intraoperative infusion of either 5% glucose or lactated Ringer's solution produced no significant differences in the growth hormone response curve. However, the plasma non-esterified fatty acid fluctuation which varied with the type of infusion corresponded to the changes in growth hormone levels, suggesting an involvement of the latter in fat metabolism.

7323 ACTION OF PSYCHOTROPIC SUBSTANCES ON CERTAIN EXPERIMENTAL GASTRIC VASOMOTOR REACTIONS: DIENCEPHALIC FUNCTIONS AND GASTRIC PATHOLOGY. *(Fr.)* Bel, A. (Red Cross Hosp., Lyon, France), J. Nesmoz and C. Trepo. *Sem Hop Paris* 46(29):1-6, 1970.

The protective action of sulpiride on gastric mucosa against polymyxin B-induced ulcerations was studied in 120 female rats. Polymyxin B (1.5 mg/kg i.p.) was given 30 min after s.c. administration of saline in control groups, thioproperazine (5 mg/kg) in the reference group, or sulpiride (15, 30 or 60 mg/kg) in the treated groups. The mortality rate in the control animals was 87% and only 30 to 35% in the treated and reference groups with no significant differences in mortality rate between the different dosages of sulpiride. Early gastric lesions appeared in all control animals while 30 to 40% of the 15 and 30 mg/kg treated groups and 70% of the 60 mg/kg treated group were free of lesions. The protective action of sulpiride, which has no antihistaminic or antiserotonin effects, is attributed to a central nervous system process generated by the hypothalamus which may be direct or mediated by metabolic processes of cerebral amines.

7324 EXPERIENCE WITH AUGMENTED HISTALOG GASTRIC ANALYSIS. *(E.)* Burney, S. W. (VA Outpatient Clin., Boston, Mass.), J. R. Ross, O. Kusakcioglu and M. Sultan. *Lahey Clin Found Bull* 19(3):93-102, 1970.

Maximal histalog gastric stimulation was evaluated in 56 patients with known gastrointestinal diseases (17 men and 7 women with active or inactive duodenal ulcer 5 men with active stomal ulcers, 1 man and 1 woman with asymptomatic postgastrectomy, 2 men with stomach carcinoma, 5 men and 3 women with various intestinal complaints without evidence of ulcers, and 3 women with gastric ulcers). The mean maximal acid output values in mEq HCL/hr were as follows: duodenal ulcer, men 36.5, women 23.7; gastric ulcer, men 11.0, women 17.1; stomal ulcer, men 17.1; esophagitis, men 33.8, women 20.6; carcinoma, men 4.8; dyspepsia, men 15.4, women 10.9. Of 58 examinations, 44 (76%) were satisfactory, and 14 (24%) were unsatisfactory due to insufficient volume and/or contamination with bile. When adequate specimens were submitted, correlation between maximal stimulation of parietal cell mass (maximal acid output) and clinical impression was high enough to make the test a valuable supplement to a complete gastric review.

7325 USE OF SULPIRIDE IN ORGANIC AND FUNCTIONAL DIGESTIVE DISEASES. *(Fr.)*

Geoffroy, H. (C. H. U. Reims, France), S. Bajolet, P. Coudoux, J. P. Brunois, P. Chardon, C. Behar, M. Dalle and B. Deroche. *Sem Hop Paris* 46(29):23-29, 1970.

Sulpiride, (a new psychotropic drug), was given i.m. (300 mg daily) to 27 patients with gastroduodenal ulcers, 13 patients with gastritis or duodenitis and to 10 patients with neurovegetative disorders. Pain and vomiting disappeared within 3 to 5 days in all cases, and noncallous ulcers revealed considerable improvement within 20 days according to radiological and endoscopical findings, while certain ameliorations occurred in cases of ulcer complications (peritoneal involvement, perforations, or hemorrhage). Clinical improvement in gastritis and duodenitis with alcoholic, smoking, iatrogenic or bile reflux etiology or due to hiatal hernia were confirmed by gastroscopy. Favorable results were obtained in neurovegetative disorders as well, and good hematologic and renal tolerance of the drug with no side effects was ascertained.

7326 SPONTANEOUS CLOSURE OF TRAUMATIC PANCREATODUODENAL FISTULAS WITH TOTAL INTRAVENOUS NUTRITION. *(E.)*

Dudrick, S. J. (Hosp. U. Pennsylvania, Philadelphia), D. M. Wilmore, E. Steiger, J. A. Mackie and W. T. Fitts, Jr. *J Trauma* 10(7):542-553, 1970.

The use of intravenous hyperalimentation in 3 patients with severe abdominal trauma, complicated by pancreato-duodenal fistula formation was investigated. The base nutrient mixture was a hypertonic solution consisting of approximately 20% glucose, 4% protein hydrolysate, and containing 5.25-6.0 g nitrogen and 900-1000 calories/1. Electrolytes, essential vitamins and micronutrients were added as indicated or desired. Prevention of infection or sepsis and hyperosmolar nonketotic hyperglycemia were maintained during patient management. In each of the 3 patients, the clinical course greatly improved within 1-2 days following the initiation of parenteral hyperalimentation. Secretions were sharply reduced initially, and gradually ceased with spontaneous wound healing and fistula closure. Significant weight gain occurred in all 3 patients despite the hypermetabolism associated with fever.

7327 EFFECT OF GRADED DOSES OF PENTAGASTRIN IN PATIENTS WITH AND WITHOUT GASTRITIS. *(E.)*

Berstad, A. (Ullevaal Hosp., Oslo, Norway) and J. Myren. *Gut* 11(4):299-302, 1970.

The effect of graded doses of pentagastrin on the gastric secretion of acid was studied in patients with and without gastritis. In patients with and without gastritis the maximal output of HCl following 0.3 μg/kg/hr of pentagastrin was 85 and 66%, resp., of the maximal response to 7.5 μg/kg/hr; the difference was significant only in the gastritis patients. In patients with and without a normal gastric mucosa, the maximal HCl response following 1.5 μg/kg/hr of pentagastrin was 102 and 91%, resp., of the response to 7.5 μg/kg/hr. The gastric mucosa with a severely reduced number of scattered parietal cells apparently needs a higher dose of pentagastrin or an infusion for more than 45-75 min to obtain a maximal HCl response.

7328 EFFECT OF ALKYLBENZENESULFONATE AS A VEHICLE FOR 4-NITROQUINOLINE-1-OXIDE ON GASTRIC CARCINOGENESIS IN RATS. *(E.)*

Takahashi, M. (Med. Sch. Nagoya City U., Japan). *Gann* 61(1): 27-33, 1970.

The effect of alkylbenzenesulfonate as a vehicle for 4-nitroquinoline-1-oxide on gastric carcinogenesis was studied in rats. Rats were divided into groups which were given (by esophageal intubation) 1 mg of 4-nitroquinoline-1-oxide in 1 ml of 20% ethanol with 8% alkylbenzenesulfonate 2-3 times a week for 18 weeks, or the same dose in 1 ml of 20% ethanol alone, or 1 ml of 20% ethanol with 8% alkylbenzenesulfonate without 4-nitroquinoline-1-oxide for controls. No neoplasms of the stomach or other organs were seen in the controls. Of 15 treated animals in the first group, 2 adenocarcinoma, 1 hemangiosarcoma, 1 hemangioma, 2 atrophic gastritis, multiple sarcomas of the forestomach, 5 squamous cell carcinomas, and 2 giant squamous cell papillomas were found. In the group with the carcinogen without the surfactant, only benign papillomas of the forestomach were found in 9 rats and 1 case of liver sarcoma was found. The surfactant, alkylbenzene sulfonate appeared to increase the carcinogenicity of 4-nitroquinoline-1-oxide.

7329 GASTRIC MUCOSA IN IRON DEFICIENCY ANEMIA: RESULTS OF FOLLOW-UP EXAMINATION. *(E.)*

Ikkala, E. (2nd Dept. Med., U. Helsinki, Finland), H. J. Salmi and M. Siurala. *Acta Haemat* 43(4): 228-231, 1970.

Gastric mucosa biopsy findings were examined in a 7-year follow-up study in 48 patients with iron deficiency anemia. Thirty of 48 patients had had one or more anemic episodes and one had received iron medication regularly. Normal hemoglobin values were found in only 13 patients; no examination was performed in remaining 5 patients. Anemic episodes had been present in 6 of 14 patients with atrophic gastritis and in 7 of 9 patients with normal gastric mucosa at first examination. The present examination showed 19 patients were non-sideropenic, while 12 had distinct iron deficiency anemia and 17 sideropenia with hemoglobin levels over 12 g/100 ml; occurrence of anemia did not correlate with biopsy findings of the first examinations. During the follow-up period, the state of gastric mucosa had improved in 3 patients, progressed in 12, and remained unchanged in 33. Anemic episodes were more prevalent in patients showing a progression of gastritis than in those who improved. The occurrence of atrophic gastritis at present examination showed a clear correlation with the age of the patients: normal gastric mucosa patients had a median age of 39 years (22-59 years), median age of patients with superficial gastritis was 39 years (25-57 years), and median age for atrophic gastritis patients was 56 years (31-77 years). Iron deficiency seemingly predisposes alterations of gastric mucosa.

7330 CARCINOGENICITY OF FORMIC ACID 2-[4-(5-NITRO-2-FURYL)-2-THIAZOLYL]HYDRAZIDE. *(E.)* Cohen, S. M. (U. Wisconsin Med. Sch., Madison), E. Erturk and G. T. Bryan. *Cancer Res* 30(4):906-912, 1970.

STOMACH AND DUODENUM

Peptic Ulcers

7384 SERUM GASTRIN LEVELS IN PATIENTS WITH PEPTIC ULCER DISEASE. *(E.)* McGuigan, J. E. (U.
'lorida Coll. Med., Gainesville) and W. L. Trudeau.
astroenterology 59(1):6-12, 1970.

'asting serum gastrin levels from 67 patients with
eptic ulcer disease and 102 hospitalized patients
ithout recognized gastrointestinal disease of simi-
ar age and sex distribution were investigated by
adioimmunoassay. Unlike patients with the Zollinger-
llison syndrome, patients with ordinary peptic ulcer
isease were not found to have elevated serum mean
asting gastrin levels when compared to the control
opulation (98 and 165 pg/ml, resp.). The serum
astrin concentrations for patients with gastric
lcers, pyloral-antral ulcers, and duodenal ulcers
ere 126, 118, and 82 pg/ml, resp. Mean fasting
erum gastrin levels in the control population
ncreased with increasing age (20-39 yr; 40-59 yr;
0-75 yr; greater than 80 yr; 52, 118, 213, 518
g/ml, resp.). These changes in fasting serum
astrin levels with increasing age apparently
eflect the effects of achlorhydria (and less com-
lete forms of reduced acid secretion) in removing
he usual inhibition of gastrin release due to
ntral acidification.

385 GASTRODUODENAL PEPTIC ULCER AND ALTITUDE. *(It.)* Estremadoyro Robles, O. (Eriquipa
osp., Peru), A. Salazar Arce and M. Canevaro Valdez.
inerva Gastroent 16(2):51-56, 1970.

ne incidence of peptic ulcer and the ratio between
astric peptic ulcer and duodenal peptic ulcer as
elated to altitude of residence were studied in a
opulation of 420 patients with radiologically and/or
rgically confirmed diagnosis. Altitude was classi-
ed as low (below 1500 m above sea level), medium
500-3000 m above sea level), and high (more than
00 m above sea level). Peptic ulcers occurred most
equently between 20 and 30 years-of-age in the
gh altitude group while its highest incidence was
tween 30 and 40 years-of-age in the low altitude
oup. Complications such as macroscopic hemorrhage,
rforations and pyloric obstructions occurred in
% of the high altitude group, 45% of the medium
titude group and 42% of the low altitude group.
rgical treatment was applied to 23% of the high
titude population with the highest mortality and
5.2% with no mortality in case of the low altitude
oup. Incidence of the disease was always higher
males, and the gastric/duodenal peptic ulcer
tio increased from 0.25 in the low altitude group
0.45 in the high altitude group. No differences
gastric acidity were found.

86 PRODUCTION BY SECRETAGOGUES OF DUODENAL ULCERS IN THE RAT. *(E.)* Robert, A.
pjohn Co., Kalamazoo, Mich.), T. J. Stout and J.
Dale. *Gastroenterology* 59(1):95-102, 1970.

odenal ulcers were produced in rats by the s.c.
fusion of secretagogues (histamine dihydrochloride,
rbachol, and pentagastrin) alone and in combination
er a 48 hr period. The dose required to produce duodenal ulcers in 50% of the animals (ED_{50}) was 1.5 mg/kg/min for histamine, 2 μg/kg/min for carbachol, and undetermined for pentagastrin. Synergistic effects observed when combinations of the secretagogues were used were reflected by the ED_{50} values determined for the combination of histamine dihydrochloride (0.1 mg/kg/min) and carbachol (0.3 μg/kg/min), of histamine dihydrochloride (0.75 mg/kg/min) and pentagastrin (1 μg/kg/min), and of pentagastrin (1 μg/kg/min) and carbachol (0.25 μg/kg/min). Ulcers were found only in the duodenum except in those cases where the animals had peritonitis as a result of the perforations, and the incidences of gastric ulcers, duodenal perforations, and mortality were parallel and increased with higher doses of secretagogues. The duodenal ulcers were located on the duodenum opposite the mesenteric attachment and all degrees of severity were observed.

7387 XYLAMIDE AS A GASTROTROPHIC AND GASTRIC PROTECTIVE AGENT IN THE TREATMENT OF GASTRODUODENAL ULCER. *(It.)* Galeone, M. (1st Dept. Surg., U. Milan, Italy), S. B. Doldi, G. Fichera and A. Bastagli. *Minerva Gastroent* 16(2):70-93, 1970.

The epithelializing effect of Xylamide (an N-benzoyl derivative of glutamic and aspartic acid) was studied on 18 dogs with surgically-induced gastric lesions and on 100 patients with gastric, duodenal and postgastrectomy ulcers and in patients with gastroduodenitis of various etiologies. Optimal effects were obtained with daily single doses of 800 mg (10 to 40 days) in gastroduodenitis (93%) and of recently developed acute ulcers (72%). No improvement occurred in advanced ulcer patients with atrophic lesions (28%) although the drug was useful in presurgical treatment.

7413 THE EFFECT OF DIET ON ILEOSTOMY FUNCTION. *(E.)* Thomson, T. J. (Stobhill Ruchill Hosp., Glasgow, Scotland), J. Runcie and A. Khan. *Gut* 11(6):482-485, 1970.

Data from 952 patients (65% female, 35% male) with ileostomies from 1 to 10 yr was compiled to assess the influence of specific dietary items on ileostomy function. The incidence of general ileostomy difficulties tended to increase with time, especially after 10 yr following the operation, although most of the patients had no trouble choosing a diet. Onions and fish were found to be the most troublesome foods while cellulose-rich foods caused the least disturbance. Watery flow was caused most often by alcohol and rhubarb; flatulence occurred after ingestion of peas, onions or beans, and pain and odor incriminated onions most commonly. A mixed diet is therefore acceptable to ileostomy patients, the exact content of which can be chosen by the individual patient.

7414 THE USE OF SOLVENTS IN THE INTESTINAL MANIFESTATIONS OF MUCOVISCIDOSIS. *(E.)* Bowring, A. C. (Prince of Wales Hosp., New South Wales, Australia), R. F. C. Jones and I. B. Kern. *J Pediat Surg* 5(3):338-343, 1970.

The effect of Tween 80, a surface active and emulsifying agent, on intestinal obstruction in meconium ileus was investigated. Only 3 out of 24 cases treated without using Tween 80 survived more than 1 month following ileostomy, whereas 17 out of 23 cases in a second series survived when all were treated with Tween 80 (1% in Tyrode's solution). Tween 80 has the advantages that it can be used during operation, is suitable for prolonged use p.o. and is nonirritating and economical.

Regional Enteritis

7430 ACUTE DILATATION OF COLON IN CROHN'S DISEASE. *(E.)* Javett, S. L. (St. George's Hosp., London, England) and B. N. Brooke. *Lancet* 2(7664):126-128, 1970.

Five case reports where acute toxic dilation of the colon occurred as a complication in Crohn's disease are presented. The frequency of the colonic distension with ulcerative colitis is so great that the development of dilation almost inevitably leads to a diagnosis of ulcerative colitis, but these 5 cases suggest that Crohn's disease may produce an acute abdominal emergency (especially when the colon is affected) similar to that in ulcerative colitis.

SMALL INTESTINE

Malabsorption

7436 PARATHORMONE-INDUCED RENAL BICARBONATE WASTAGE IN INTESTINAL MALABSORPTION AND IN CHRONIC RENAL FAILURE. *(E.)* Muldowney, F. P. (St. Vincent's Hosp., Dublin, Ireland), J. F. Donohoe, R. Freaney, C. Kampff and M. Swan. *Irish J Med Sci* 3(5):221-231, 1970.

Studies were performed on 3 patients with systemic acidosis due to intestinal malabsorption secondary to jejunal lymphoma (62-yr-old woman) or to uremia secondary to polycystic renal disease (44-yr-old man and 47-yr-old woman), in order to determine the effect of large doses of vitamin D on renal bicarbonate loss in both of these conditions. The patient with malabsorption exhibited hypocalcemia with a stable systemic acidosis and high urine pH during the control period. NH_4Cl stimulation produced a normal urine pH and total acid output while bicarbonate infusion produced a reduced renal bicarbonate threshold (1.8 to 1.9 mEq/l plasma) and a reduced bicarbonate transport maximum (1.90 mEq/min/ 100 ml). Oral vitamin D_2 (2.5 to 15 mg/day) restored serum calcium and serum bicarbonate to their normal levels, and also increased the renal bicarbonate threshold and transport maximum. Similar results were obtained in the two patients with renal disease after the oral administration of vitamin D.

7437 SMALL INTESTINAL MUCOSAL ABNORMALITIES IN RELATIVES OF PATIENTS WITH DERMATITIS HERPETIFORMIS. *(E.)* Marks, J. (Dept. Derm., U. Newcastle, England), D. Birkett, S. Shuster and D. F. Roberts. *Gut* 11(6):493-497, 1970.

Biopsies of the small intestine were taken in 29 patients with dermatitis herpetiformis and in 18 of their relatives to assess the degree of familial occurrence of the disease with gluten sensitivity. The biopsies were taken from either the first 20 cm of small bowel or from the third of fourth part. A predominantly convoluted mucosa in 32% of the patients' relatives proved significantly higher than values for the general population (8%). The relatives generally suffered no bowel problems and only one was found with small bowel abnormality whose propositus did not have the celiac syndrome. The mechanism of inheritance of the dermatitis and the percentage of the population also suffering from the celiac syndrome remain to be studied, although a genetic factor is believed to be involved in production of the dermatitis herpetiformis as in other forms of the celiac disease.

7438 A PSYCHIATRIC STUDY OF PATIENTS WITH DISEASES OF THE SMALL INTESTINE. *(E.)* Goldberg, D. (Dept. Psychiat., U. Manchester, England). *Gut* 11(6):459-465, 1970.

Forty-six patients with idiopathic steatorrhea, 23 with Crohn's disease and 11 patients with alactasia were given standard psychiatric interviews to assess the relation of psychiatric disturbance with the organic disease. Psychiatric symptoms (fatigue, irritability, depression, phobias, anxiety) were rated by frequency and intensity, and blood tests for hemoglobin, plasma proteins, serum iron, vitamin B_{12}, folate, calcium and phosphate were also performed. Idiopathic steatorrhea, the only disease related to malabsorption, was not particularly associated with psychiatric disturbance, suggesting that dietary deficiencies are not the cause of the psychiatric illness. Severity of psychiatric illness and bowel movements were related in that 9.8% of normal subjects described their stools as offensive, as compared to 41% of the psychiatrically ill. Distress associated with the diarrhea was not found to be a causal factor in psychiatric disturbances. Previous history of psychiatric illness was found to be more common in subjects with idiopathic steatorrhea, as were depressive traits. Psychiatric illness does not seem to be related to general malabsorption or to dietary deficiencies, although a correlation was found between emotional disturbance and bowel activity.

7439 DERMATOGENIC ENTEROPATHY. *(E.)* Marks, J. (Roy. Victoria Infirm., Newcastle, England) and S. Shuster. *Gut* 11(4):292-298, 1970.

One hundred inpatients with various skin diseases (including eczema, psoriasis, Darier's disease and licken planus) were evaluated clinically and by laboratory tests for the presence of dermatogenic enteropathy. Five of the 100 patients (41 erythroderma, 47 moderately extensive skin disease, 12 limited skin disease) complained of diarrhea, another had pale, bulky stools and 5 had lost weight. Steatorrhea was very common in patients with erythroderma (100% skin involvement), with a significant difference between the above group and those with less extensive skin disease. The steatorrhea improved significantly with response of the rash to topical treatment in 17 of 18 patients. Three of 4 patients studied in more than one attack developed steatorrhea in each attack, although their fecal fat excretion returned to normal when the rash remitted. The urinary indican was not increased in 4 of 6 patients, suggesting that coliforms were not present in excessive numbers in the small bowel. The volume, bicarbonate concentration, and amylase content of the duodenal juice were normal in the patient with dermatogenic enteropathy, suggesting that the steatorrhea was not due to failure of exocrine pancreatic secretion. None of the patients had a flat mucosa suggesting that the steatorrhea was not due to celiac disease.

7440 SMALL-INTESTINAL MUCOSAL ABNORMALITIES IN VARIOUS SKIN DISEASES -- FACT OR FANCY? *(E.)* Marks, J. (Roy. Victoria Infirm., Newcastle, England) and S. Shuster. *Gut* 11(4):281-291, 1970.

Patients (228) with various dermatoses (including dermatitis herpetiformis 28, psoriasis 55, eczema 53, rosacea 35 and pemphigoid 15) were investigated for the presence of small intestinal mucosal abnormalities by stereomicroscopy. A flat mucosa was found in 36% of patients with dermatitis herpetiformis but in none of the controls; a predominantly convoluted mucosa was found in 30% of the patients with dermatitis herpetiformis and in 8% of the controls. However, no special association with structural alterations in the small bowel mucosa was found in the other dermatoses studied; the frequency distribution of the predominant and individual small intestinal mucosal features was the same in patients with eczema, psoriasis and rosacea as in the local control population. There was no significant relation between mucosal appearance and sex, convolutions being found as the predominant feature in 10% and 6% of the female and male subjects, resp. Steatorrhea was found in all patients with all types of mucosal appearance; its incidence was greatest in the convoluted group. The increased incidence of a convoluted mucosa in the northeast of England requires further study to determine whether it is indicative of an increased incidence of the celiac syndrome in the region, or whether it results from a minor population difference or a local peculiarity of diet.

7441 INCIDENCE AND CLINICAL SIGNIFICANCE OF LACTOSE MALABSORPTION IN ULCERATIVE COLITIS AND CROHN'S DISEASE. *(E.)* Gudmand-Hoyer, E. (U. Hosp. Copenhagen, Denmark) and S. Jarnum. *Gut* 11(4):338-343, 1970.

The incidence of lactose malabsorption was investigated in 85 patients with ulcerative colitis and 71 patients with Crohn's disease by means of lactose tolerance tests and disaccharidase determinations in small intestinal mucosa. Lactose malabsorption was present in 8 patients with ulcerative colitis (9%) and in 4 with Crohn's disease (6%), and a control group displayed a similar incidence. Eleven of the patients with lactose malabsorption had a flat blood sugar curve during lactose tolerance testing; a glucose-galactose test was normal in all patients and was unassociated with abdominal distress. Mucosal lactase activity was depressed in all 9 patients examined. In 7 milk drinkers lactose malabsorption caused or contributed to chronic diarrhea; a lactose-free diet resulted in a considerable reduction, and in 4 patients, even total cessation of diarrhea. Lactose malabsorption is not particularly common in ulcerative colitis or Crohn's disease and its etiology appears to be unrelated to the intestinal disease.

LARGE INTESTINE

7452 SKELETAL DEFORMITIES IN CASES OF ANAL AND RECTAL ATRESIA. *(Ger.)* Schonenberg, H. (Med. Fac. Rhein-Westphalia Tech. Coll., Aachen, Germany). *Monatsschr Kinderheilk* 118(5):149-151, 1970.

Eighteen infants with anal and rectal atresia were investigated for simultaneously occurring skeletal deformities. The following deformities were found: congenital clefts in the thoracic and cervical area of the vertebral column (3); deformation of the cervical, thoracic and lumbar regions (1); hypoplasia and bifurcation of the ribs without demonstrable changes of the spinal column (2); duplication of the radial (1) and tibial (1) ossification centers. Another infant showed bilateral aplasia of radius and thumb and, in addition, kidney aplasia (right), hydronephrosis and mega-ureter (left) and uterus bipartus. This last observation vividly recalled the thalidomide embryopathy. Multiple skeletal deformations in combination with anal and rectal atresia seem to constitute a specific syndrome of unknown etiology.

7453 ULTRASTRUCTURE OF THE RECTAL WALL IN HUNTER'S SYNDROME. *(E.)* Elsner, B. (Washington U. Sch. Med., St. Louis, Mo.). *Gastroenterology* 58(6):856-862, 1970.

The ultrastructure of the rectal wall was studied in a 3-year-old male with Hunter's syndrome (mucopolysaccharidosis, type II). Membranous cytoplasmic bodies were found in the ganglion and satellite cells of the intramural plexi and the connective tissue cells showed an abundance of cytoplasmic vacuoles. These findings, similar to one described in the brain, can be of diagnostic significance in mucopolysaccharidosis when found in rectal biopsy. The patient was found to have extensive involvement of the neurons of myenteric and submucosal plexi of the bowel by these inclusions which may result in disturbance of autonomic innervation and be the cause of diarrhea.

7454 OBSERVATIONS ON AN UNUSUAL ENZYME DISTRIBUTION PATTERN IN THE COLON OF A CASE OF FAMILIAL POLYPOSIS WITH MALIGNANT CHANGES. *(E.)* Maggi, V. (Mem. Hosp., London, England) and A. P. Wyatt. *Gut* 11(4):319-322, 1970.

The distribution pattern of acid and alkaline phosphatases, esterases and β-glucuronidase in a case of familial polyposis of the colon with malignant changes was investigated histochemically. In the normal mucosa acid phosphatase activity was present in the cells of the lamina propria and around the mucin droplets of the numerous goblet cells; in the polyp, activity was present at the base of these cells and in the cancer tissue, activity was present also in the invading and proliferating cells. β-Glucuronidase activity was very low and had a distribution and behavior similar to that described for acid phosphatase in the normal mucosa, but activity was increased in the polyps and decreased in the cancer. The behavior of esterases was similar to that of β-glucuronidase. In the normal mucosa and in the polyps alkaline phosphatase was present only in the capillaries and little or no activity was observed in the epithelium, connective tissue, or muscle cells in either of these structures, while in the cancer, invading and proliferating cells contained high enzyme activity, predominantly in the form of granules. Alkaline phosphatase was also present at the junction between the epithelium of the mucosa and the lamina propria. Acid hydrolases may be enzymes involved in the breaking down of the connective tissue surrounding the polyps, thus facilitating its invasion by cancer cells.

7455 RADIOPOTENTIATING ACTION OF 1-β-D-ARABINOFURANOSYLCYTOSINE IN A XENOGRAFTED HUMAN COLONIC CARCINOMA. *(E.)* Goldenberg, D. M. (U. Pittsburgh Sch. Med., Pa.). *Proc Soc Exp Biol Med* 134(2):510-512, 1970.

The radiopotentiating action of 1-β-D-arabinofuranosylcytosine in a xenografted human colonic carcinoma was investigated in unconditioned hamsters. Radiopotentiation was defined as any significant improvement above the expected arithmetic sum of each modality's own range of tumor growth-inhibition without a concomitant increase in host toxicity. At the maximally tolerated single daily dose of 1-β-D-arabinofuranosylcytosine in the hamster (24 mg/kg i.p.) no uniequivocal radiopotentiating effects could be ascertained. Reducing this dose by one half, however, did result in a synergistic antitumor effect for the combination of this agent and 300 r x-rays, a particularly striking effect since each parameter alone was at its minimally effective dose. The maximum tumor growth inhibition obtained for this combination was 40%, but this could be increased to 70% by merely altering the 1-β-D-arabinofuranosylcytosine dosage schedule to 4 mg/kg three times daily. The improved efficacy of a divided dose schedule was again reflected in the tumor-inhibitory effects of the drug alone, yielding a growth inhibition equivalent to that of the combination therapy of the preceding experiment (40%).

7456 POSITION OF THE CARCINOEMBRYONIC ANTIGEN OF THE HUMAN DIGESTIVE SYSTEM IN ULTRASTRUCTURE OF TUMOR CELL SURFACE. *(E.)* Gold, P. (Montreal Gen. Hosp., Quebec, Canada), J. Krupey and H. Ansari. *J Natl Cancer Inst* 45(2):219-225, 1970.

Cancerous colonic tissue blocks or cell suspensions incubated with the ferritin-anti-carcinoembryonic antigen conjugate for 1 hr at 37°C were processed in order to investigate the ultrastructural localization of carcinoembryonic antigen. Normal colonic tissue samples incubated with the ferritin-anti-carcinoembryonic antigen preparation revealed no significant ferritin labeling at any time, but sections of tumor cells exposed to the conjugate showed marked accumulations of ferritin. In every case, the ferritin was localized primarily in the "fuzz" or glycocalyx coating the surface membrane of the colonic tumor cell. Where a portion of the ferritin particles was immediately adjacent to the plasma membrane, it was occasionally difficult to distinguish whether some label had localized within, or just beyond, the trilamellar structure. The carcinoembryonic antigen of the human digestive system is apparently primarily in the glycocalyx of the colonic cancer cell.

LARGE INTESTINE

Ulcerative Colitis

7498 INFLAMMATORY BOWEL DISEASE IN ANKYLOSING SPONDYLITIS. *(E.)* Jayson, M. I. V. (Roy. Natl. Hosp. Rheum. Dis., Bath, England), P. R. Salmon and W. J. Harrison. *Gut* 11(6):506-511, 1970.

The presence of ulcerative colitis and inflammatory bowel disease was determined in 48 patients with ankylosing spondylitis who were subjected to complete abdominal examinations, sigmoidoscopy and biopsies of the large bowel. A diagnosis of proctocolitis was made in 8 patients (17%), 7 of whom were believed to have ulcerative colitis and the other Crohn's disease. A history of diarrhea was obtained in 5 subjects, but no symptom of bowel disease was present in the other 3 patients. The prevalence of chronic inflammatory bowel disease in patients with ankylosing spondylitis suggests an association between the 2 conditions.

7499 URINARY CRYSTALLOID EXCRETION IN PATIENTS WITH INFLAMMATORY BOWEL DISEASE. *(E.)* Breuer, R. I. (Evanston Hosp., Ill.), E. A. Gelzayd and J. K. Kirsner. *Gut* 11(4):314-318, 1970.

Because of the potential relation of increased urinary crystalloid excretion and concentration to stone formation, urinary calcium and uric acid excretion patterns were studied prospectively in 65 patients with inflammatory bowel disease (ulcerative colitis, granulomatous bowel disease) and compared with excretion patterns in patients with functional bowel disease (controls) receiving similar dietary prescriptions. Mean 24-hr urinary calcium excretion was higher in both ulcerative colitis (212 mg) and granulomatous bowel disease (168 mg) than in controls (118 mg). Urinary calcium excretion exceeded 250 mg/24 hr in 11 of 34 inflammatory bowel disease patients; none of the controls exhibited this magnitude of calciuria. Eight of these 34 patients compared with one of 10 controls excreted urine with calcium concentration greater than 20 mg/100 ml. Mean 24-hr urine volumes were 1,525 ml for ulcerative colitis and 1,046 ml for functional bowel disease. Mean urinary sodium excretion (mg/24 hr) was 103 for ulcerative colitis, 130 in regional enteritis, and 70 in controls. Mean 24-hr uric acid excretion was slightly higher in granulomatous bowel disease (520 mg) than in ulcerative colitis (450 mg) or functional bowel disease (451 mg). Eight inflammatory bowel disease patients excreted more than 700 mg uric acid in 24 hr; none of the controls reached this level. The mean urinary uric acid concentration was significantly higher in ulcerative colitis (538 µg/ml) and in granulomatous bowel disease (558 µg/ml) than in controls (338 µg/ml). The mean morning urine pH was lower (5.5) in ulcerative colitis than in the other groups. There was apparently increased excretion and higher concentration of calcium and uric acid in some patients with inflammatory bowel disease on the usual treatment programs.

7500 ULCERATIVE COLITIS, REGIONAL ILEITIS AND SULPIRIDE. *(Fr.)* Toulet, J. (Int. Hosp., U. Paris, France) and J. Rousselet. *Sem Hop Paris* 46(29):41-53, 1970.

Sulpiride (100 mg i.m. twice daily for 10 - 15 days followed by a maintenance dosage of 150 to 300 mg daily p.o.) was administered to 13 patients (9 women and 4 men, middle-aged) with ulcerative colitis. Four patients with Crohn's disease (2 women and 2 men, 20-55 yr) received the drug for 18 days (100 mg 4 times daily i.v. and i.m.); the maintenance treatment consisted of 450 mg p.o. for 3 months. Clinical improvement occurred in 10 out of 13 cases of ulcerative colitis within 3-7 days, while endoscopic findings improved within 3 to 4 weeks and remarkable improvement was noted in 2 out of 4 cases of Crohn's disease. Side effects consisted of amenorrhea with galactorrhea in 4 cases, chest discomfort in 2 cases (out of 8) and male impotency in 1 out of 6 cases.

LIVER AND BILIARY TRACT

7524 PRIMARY CARCINOMA OF THE LIVER: I. PATHOLOGICAL ANATOMY, PRIMARY CANCER OF THE LIVER AND HEPATIC CIRRHOSIS. *(Ger.)* Ortmans, H. (St. Hosp. Kassel, Germany), H. Selmair and E. Wildhirt. *Munchen Med Wschr* 112(26):1245-1251, 1970.

The incidence, pathologic-anatomic characteristics, and correlations between cancer and cirrhosis of the liver were studied in 100 cases of primary hepatic carcinoma (89 male, 11 female), selected from a large number of patients with cirrhosis of the liver (2563) and from unselected autopsy material (5923). Cirrhosis was associated with 96 of 100 cases of primary hepatic carcinoma, and the frequency of primary carcinoma in alcoholic forms of cirrhosis was 2.8% and in cirrhosis associated with hemochromatosis, 14.3%. The incidence of carcinoma was highest in advanced age (50-70 yr), and an increase in absolute and relative occurrence was found in the last decade. Previously described pathologic-anatomic characteristics of primary hepatic carcinoma and a pronounced tendency to necrosis and hemorrhage were confirmed. The average weight of the carcinomatous liver was 2800 g although atrophic livers weighing below the norm (1000 g) were found in 4 cases. Extensive central necroses

: tumor nodes were found in half of the autopsied
ases and invasion of the tumor into the branches of
ie portal vein was observed in 18 out of 100 cases
.8%); the subsequent occurrence of ascites was noted
1 14 of 21 autopsied cases. The histologic differen-
.ation of 68 cases of primary hepatic carcinoma
owed the following distribution: hepato-cellular
56); cholangio-cellular (11); mixed form (1). The
creased occurrence of primary hepatic carcinoma
iring the last decade is explained by improved
eatment of the complications of hepatic cirrhosis
d the increasing chances of survival of the patients.

25 EFFECTS OF 3-METHYLCHOLANTHRENE PRE- TREATMENT ON MICROSOMAL HYDROXYLATION OF ACETAMIDOFLUORENE BY VARIOUS RAT HEPATOMAS. *(E.)*

tlikar, P. D. (Temple U. Sch. Med., Philadelphia,
.). *Biochem J* 118(3):513-518, 1970.

male Buffalo rats were used to determine the N-
d ring hydroxylation of 2-acetamidofluorene by
crosomal preparations of various transplantable
d primary hepatomas and their host livers and
dneys with and without 3-methylcholanthrene pre-
eatment of tumor-bearing animals. The liver of
treated control animals had much greater hydroxy-
ting activity than did kidney (25 vs 9 nmole/20
n/g wet tissue for N-hydroxy-2-acetamidofluorene);
etreatment with 3-methylcholanthrene increased
th N- and ring hydroxylating activity of liver
veral-fold. Well-differentiated Morris hepatomas
23C, 5123D, 5123CTC and 7800 and their host livers
l low hydroxylating activity, and 3-methylcholan-
rene produced a several-fold increase of both N-
d ring hydroxylation in the host livers but increa-
l only the ring hydroxylation in the tumors, except
hepatoma 5123CTC where both activities were
creased. Hydroxylating activities of poorly
fferentiated Morris hepatoma 7288CTC and Novikoff
atoma were low and unaltered by 3-methylcholan-
ene pretreatment. Primary hepatomas produced by
inistration of 4-dimethylamino-3'-methylazobenzene
ild be stimulated to some extent with 3-methylcho-
threne pretreatment. Like host livers, N- and
g hydroxylation activities in kidneys of tumor-
ring animals could also be stimulated to some
ent by 3-methylcholanthrene pretreatment.

6 RELATIONSHIP OF SERUM TOCOPHEROL TO β- LIPOPROTEIN CONCENTRATIONS IN LIVER EASES. *(E.)*

Kater, R. M. H. (Boston City Hosp.,
s.), W. J. Unterecker, C. Y. Kim and C. S.
idson. *Amer J Clin Nutr* 23(7):913-918, 1970.

tocopherol and β-lipoprotein concentrations in
a of patients with various liver diseases (36
te infectious hepatitis, 27 acute alcoholic
atitis, 55 alcoholic cirrhosis, 34 fulminant
atic failure), hospitalized patients with other
eases, and healthy controls were compared. Sig-
icant depression of mean tocopherol concentration
found in patients with severe cirrhosis (0.49 mg/
ml) and patients with fulminant hepatic failure
42 mg/100 ml) compared with any of the other 5 groups including hospitalized controls (0.92 mg/100 ml). Mean serum tocopherol concentrations in patients with acute viral hepatitis (0.98 mg/100 ml) and acute alcoholic hepatitis (1.10 mg/100 ml) did not differ significantly from those of healthy controls. No significant difference was found between the mean serum tocopherol concentration in patients whose diet was considered to be adequate (0.84 mg/100 ml) and those whose diets were grossly deficient (0.89 mg/100 ml). A direct correlation between the serum tocopherol and β-lipoprotein concentrations was found (r = 0.894), indicating that the tocopherol concentration was proportional to the β-lipoprotein level in the sera of these patients. In severe liver disease a critical degree of malfunction may be reached when β-lipoprotein production is impaired sufficiently to cause a decrease in serum tocopherol.

7527 FASTING HYPOGLYCEMIA AND METABOLIC ACIDOSIS ASSOCIATED WITH DEFICIENCY OF HEPATIC FRUCTOSE-1,6-DIPHOSPHATASE ACTIVITY. *(E.)*

Baker, L. (Sch. Med. U. Pennsylvania, Philadelphia) and A. I. Winegrad. *Lancet* 2(7662):13-16, 1970.

A child with fasting hypoglycemia and metabolic acidosis associated with deficiency of hepatic fructose-1,6-diphosphatase activity was described. After a 12 hr overnight fast (following an extended normal diet) her blood glucose was 56 mg% with no accompanying abnormality in pH, plasma free fatty acids, blood ketones or blood lactate; after 21 hr of fasting the blood glucose was under 10 mg%, and 1 mg of glucagon, i.v., resulted in no rise in blood glucose. Plasma free fatty acids and blood ketone levels rose progressively during the fast, reaching levels found in patients with moderate diabetic acidosis. The blood lactate reached 5.5 mEq/l and contributed significantly to the metabolic acidosis. At the end of the investigation, the arterial pH was 7.17, the CO_2 was 9.3 mEq/l, and the uric acid content was 12.3 mg% (control 5.3 mg%). The child had a normal glucose tolerance and a normal rise of blood glucose after p.o. galactose; plasma insulin levels were normal during both studies (fasting level was 14μU/ml, peak value was 109μU/ml ½ hr after glucose ingestion, and levels 3 hr after glucose ingestion were 25 μU/ml. Both fructose and glycerol given p.o. after an overnight fast produced hypoglycemia along with a significant rise in the blood uric acid concentration and a fall in the inorganic phosphate. No evidence of hyperinsulinemia was observed, and hereditary fructose intolerance was excluded by the demonstration of normal levels of hepatic fructose-1-phosphate aldolase and of fructose-1,6-diphosphate aldolase activities in the liver biopsy specimens. No fructose-1,6-diphosphatase could be demonstrated in the supernatant fraction of the patient's liver homogenate when assayed at neutral or alkaline pH by either spectrophotometric or fluorimetric techniques. An inherited deficiency of hepatic fructose-1,6-diphosphatase activity was probably the basis for a previously unrecognized disease, characterized by episodes of fasting hypoglycemia and metabolic acidosis.

7528 HEPATIC GLUCURONYL-TRANSFERASE ACTIVITY IN CONGENITAL AND ACQUIRED LIVER DISEASE. *(E.)* Frezza, M. (Clin. Gen. Med., U. Padua, Italy), G. De Sandre and G. Persona. *Acta Hepatosplen* 17(3):165-174, 1970.

The pathogenic and diagnostic significance of glucuronyl-transferase activity was investigated in liver biopsies from 7 normal subjects, 9 cirrhotics, 1 case of chronic obstructive jaundice, 3 cases of subacute hepatitis, 5 cases of simple post-hepatitis cholemia, 13 cases of Gilbert's disease, 4 cases of Dubin-Johnson syndrome, 2 cases of Rotor cholemia and 4 cases of hyperhemolytic jaundice. Glucuronyl-transferase activity was expressed as nmoles of substrate (4-methyl-umbellipherone) glucuro-conjugated by 1 mg of hepatic proteins in 30 min. The enzyme activity in normal patients, patients with Dubin-Johnson syndrome and Rotor cholemia, patients with Gilbert's disease, and in patients with post-hepatitis cholemia averaged 172, 141, 80, and 98, resp., with normal values ranging from 78 to 266. In subacute hepatitis and hepatic cirrhosis the glucuronyl-transferase activity appeared to be lowered, while in hemolytic jaundice, the activity seemed normal.

7529 NONKETOTIC HYPERGLYCINEMIA: AN *IN VITRO* STUDY OF THE GLYCINE-SERINE CONVERSION IN LIVER OF THREE PATIENTS AND THE EFFECT OF DIETARY METHIONINE. *(E.)* Hommes, F. A. (Dept. Pediat., St. U. Groningen, Netherlands), C. J. De Groot and J. A. Troelstra. *Pediat Res* 4(3):238-243, 1970.

Liver biopsies were performed on 3 patients suffering from nonketotic form of hyperglycinemia, and the liver homogenates were incubated under anaerobic conditions with ^{14}C-1-glycine and ^{14}C-2-glycine. The rates of incorporation into serine were similar, while under normal conditions the ratio of incorporation of ^{14}C-2-glycine/^{14}C-1-glycine is higher than 1 with a maximum of 2, indicating that the enzymic defect underlying this disease is due to the absence or nonfunction of the glycine cleavage system. In patients with hyperglycinemia, serine to glycine conversion was normal and since glycine formed in this reaction could not participate as a C_1-unit donor, accumulation occurred. The addition of methionine to a diet devoid of serine and glycine caused levels of glycine in plasma to fall to normal values in 10 days.

7530 SERUM α-FETOPROTEIN AND PRIMARY CANCER OF THE LIVER IN MAN. *(E.)* Purves, L. R. (South African Inst. Med. Res., Johannesburg), I. Bersohn and E. W. Geddes. *Cancer* 25(6):1261-1270, 1970.

Cases with abnormal liver function tests, Bantu blood donors, neonates, Caucasian patients with primary cancer of the liver, and male Bantu mine workers with primary cancer of the liver were investigated by immunodiffusion assay and radioimmunoassay for the presence of α-fetoprotein in the serum. In a series of 93 post mortem proven cases of liver pathology and in a larger series of 130 post mortem and biopsy proven patients with liver disorders, α-fetoprotein was positive in 82% and 78% of the cases, resp. No α-fetoprotein positive case coming to post mortem (more than 200 cases) was found lacking a primary liver cancer (no cases of embryonal tumor were encountered). The response to cancer chemotherapy (including mitomycin C, actinomycin D, alanine mustard and 6-mercaptopurine) was poor except in 3 cases which responded clinically and which were α-fetoprotein positive and clinical improvement was closely matched by a fall in the α-fetoprotein level. There was no correlation between α-fetoprotein and clinical data (age, tribe, weight, survival time) or histologic and morbid anatomical data (weight of the tumor or the liver or degree of differentiation of the tumor). The positivity rate was lower in noncirrhotics on admission (53%) than in cirrhotics (81%). α-Fetoprotei was detected in 98% of random neonatal serum cord blood samples, but none was detected in a single case out of 1384 blood samples obtained from healthy Bantu mine workers.

7531 MALIGNANT HEPATOMA IN THE BANTU. *(E.)* Geddes, E. W. (Dept. Cancer Chemother., U. Pretoria, Union of South Africa) and G. Falkson. *Cancer* 25(6):1271-1278, 1970.

Various cytostatic agents and/or radiotherapy were used to treat 129 of 189 male Bantu patients with histologically proven primary carcinoma of the liver, while 56 patients served as controls. The average survival time from the onset of symptoms was 4 months, and from the time of histologic diagnosis survival time was only 2 months. Tests for alpha-fetoprotein were positive in 78% of the confirmed cases with no false-positive results. No clinically detectable metastases at the time of diagnosis were observed in 78% of the 189 cases and at autopsy, 32% of the 167 patients examined had cancer confined to the liver, but lung metastases were found in 51%. Chemotherapy and radiotherapy extended the mean survival time 4 to 7 months, and intra-arterial methotrexate was the most efficacious agent, producing partial remission; no complete remissions were observed.

7532 A CLINICAL AND HISTOCHEMICAL STUDY OF CHOLESTASIS. *(E.)* Desmet, V. J. (Acad. Hosp., St. Rafael, Louvain, Belgium), A. M. Bullens and J. DeGroote. *Gut* 11(6):516-523, 1970.

Four types of cholestasis were defined in a histochemical study of conjugated and total bilirubin made on liver biopsies of 150 patients (29 cases of acute hepatitis, 17 cases of chronic persistent hepatitis, 10 cases of chronic aggressive hepatitis A, 18 cases of cirrhosis, 24 cases of extralobular obstruction, 11 cases of steatosis, 29 cases of various other disorders, and 12 normal livers). Type 0 comprised those cases without visible bile pigment, i.e., no cholestasis, while type I was characterized by the presence of intracellular pigment granules in the hepatocytes. Type II was characterized by intracellular granules and extracellular thrombi (this group was subdivided according to the eventual presence of coarse pigment deposits in the parenchymal cells). Type III was characterized by intracellular granules, extracellular thrombi, and also bile pigment in the

Kupffer cells. The fine liver cell granules and extracellular thrombi contained mainly conjugated bilirubin, whereas the coarse liver granules and Kupffer cell pigment usually contained unconjugated pigment. In Types II and III a diffuse and directly reacting pigment was also observed. Mean serum bilirubin levels were significantly different between Types I and II and between Types II and III (0.93, 3.93 and 14.05 mg/100 ml, resp.), while nearly identical levels were found in Types 0 and I (0.89 and 0.93 mg/100 ml, resp.). A correlation between the different types of cholestasis, the level of bilirubinemia, and its dynamic evolution suggested that these 4 types of cholestasis may represent successive stages of increasing cholestasis, but no type of cholestasis was typical.

7533 SPECIFICITY OF CERTAIN BIOCHEMICAL DERANGEMENTS IN HEPATOCARCINOGENESIS.

(E.) Reid, E. (Roy. Cancer Hosp., London, England). *Brit J Cancer* 24(1):128-137, 1970.

Biochemical studies were performed on livers obtained from rats placed on diets containing either ethionine or α-naphthylisothiocyanate; ethionine-induced hepatomas were also studied. Proliferation of bile duct cells was the only histologic abnormality noted with α-naphthylisothiocyanate; fat deposition was the only change noted with ethionine. Nucleotide levels in α-naphthylisothiocyanate-treated rats did not decrease but there were slight increases in AMP and GDP. There was a decrease in the nucleotide triphosphate levels of ethionine-treated rats as determined by the values for the mixed peak containing UTP and GTP and for the mixed peak rich in ATP. ADP and GDP were significantly although not sharply decreased. NAD and NADPH were also decreased in the ethionine-treated rats and NADP and NADPH were sharply decreased in ethionine-induced hepatomas. The mitochondrial fraction of liver homogenates from both groups of rats showed a decrease in the content of acid-soluble nucleotides particularly after 3 weeks of feeding; AMP, ATP and $NADPH_2$ were also lowered following 3-7 weeks of ethionine feeding. The protein of the mitochondrial and microsomal fractions was unaffected by ethionine while the protein of the mitochondrial fraction was diminished by α-naphthylisothiocyanate. In livers from ethionine-fed rats and ethionine-induced hepatomas, enzyme activity in the synthesis of UMP was increased.

7534 ACCELERATED INDUCTION OF HEPATOMA IN RATS FED N,N'-2,7-FLUORENYLENEBISACETAMIDE BY X-IRRADIATION TO THE TARGET AREA.

(E.) Nagayo, T. (Aichi Cancer Ctr. Res. Inst., Nagoya, Japan), M. to and S. Yamada. *Gann* 61(1):81-83, 1970.

The effects of N,N'-2,7-fluorenylenebisactamide eeding and X-irradiation on hepatoma growth were tudied in Buffalo rats. In macroscopical and microcopical examinations, hepatoma nodules were found ithin the area exposed to irradiation. Livers of nimals fed continuously with N,N'-2,7-fluorenyleneisacetamide were the same as livers of animals with he same diet and in addition were irradiated; observations revealed an unstable state of liver parenchyma such as bile ductule proliferation along Glisson's sheath, nodular hyperplasia, cholangiofibrosis, and foci composed of basophilic small hepatic cells, but no malignant changes were observed. The group receiving only X-irradiation alone was found normal, histologically. The duration of the carcinogen feeding was 27 weeks and at this time, no hepatoma was observed in either sex. X-Irradiation appears to accelerate neoplastic changes of liver due to N,N'-2,7-fluorenylenebisacetamide, and may lead to induction of hepatomas in a relatively short time.

7535 ANAEROBIC GLYCOLYSIS AND PATTERNS OF GLYCOLYTIC INTERMEDIATES DURING LIVER CARCINOGENESIS AND IN HEPATOMA.

(E.) Gaja, G. (Inst. Gen. Path., U. Milan, Italy), F. Gajone, M. E. Ferrero and A. Bernelli-Zazzera. *J Natl Cancer Inst* 44(6):1269-1280, 1970.

Anaerobic glycolysis and patterns of glycolytic intermediates during liver carcinogenesis and in Morris hepatoma 5123 were investigated in rats. During treatment with p-dimethylaminoazobenzene, which was accompanied by an increase in the basal glycolytic rate and in glycogen breakdown (control 65.0; treatment (3 days) 18.9 mg/g), glycolytic stimulation was always detectable in liver slices from treated animals, but it occurred at a reduced extent, not correlated with the duration of the treatment. Glycolytic stimulation disappeared suddenly in well developed p-dimethylaminoazobenzene induced hepatomas. Changes in the concentration pattern of glycolytic intermediates, particularly fructose diphosphate, triose phosphate, α-glycerolphosphate, and 3-phosphoglycerate (control 29.3, 31.3, 1571, 57.2; hepatoma treated 91.9, 31.8, 341, 70.1 nmoles/g fresh tissue, resp.), supported the view that hepatoma glycolysis was not controlled at steps which, in the normal homologous tissue, limit the metabolic flow after the level of triose phosphates or by oxygen. The pattern of glycolytic intermediates in p-dimethylaminoazobenzene fed rats was consistant with the fact that glycolytic stimulation, though reduced, was still present.

7536 RETENTION OF METABOLIC REGULATION IN THE HYPERPLASTIC HEPATIC NODULE INDUCED BY *N*-2-FLUORENYLACETAMIDE.

(E.) Teebor, G. W. (New York U. Med. Ctr., New York) and I. Seidman. *Cancer Res* 30 (4):1095-1101, 1970.

The pattern of induction of several corticosteroid-mediated enzyme responses during a period of *N*-2-fluorenylacetamide carcinogenesis which yielded a high percentage of hyperplastic hepatic nodules in rats was investigated. At 12 weeks, over 90% of the male rats contained hepatic nodules (75% of which ranged from 0.5-1.0 cm in diameter). The nodules were pale-tan and fleshy, and protruded from the external and sliced surface of the liver. The cells of the hyperplastic areas were larger than the adjacent parenchyma, the cytoplasm was granular, and the nuclei were vesicular with prominent nucleoli. At 4 weeks, carcinogen fed male and female rats both demonstrated a 30-50% decrease in basal glucose-6-phosphatase activity in both untreated and detergent-treated (0.2% deoxycholate) microsomal preparations. Subjecting the rats to a 24 hr starvation period resulted in an increase to control levels of glucose-6-phosphatase activity in male rats which was apparent only in the detergent-treated preparation. Basal activity of hepatic tyrosine transaminase in carcinogen-fed rats was 50-60% of controls at 4 weeks and remained at this level throughout the 12 week period in both males and females, and basal tryptophan pyrrolase activity was half that of controls in both males and females at 8 weeks but was near normal at 12 weeks. Induction of both tyrosine transaminase and tryptophan pyrrolase by hydrocortisone was the same in control and carcinogen-fed rats at 12 weeks, and induction of glucose-6-phosphatase by triamcinolone was normal in both groups also.

7537 EFFECTS OF EXOGENOUS HISTONES UPON THE INDUCTION OF TRYPTOPHAN PYRROLASE AND TYROSINE TRANSAMINASE IN LIVER AND MORRIS HEPATOMAS.

(E.) Strobel, H. W., Jr. (Sch. Med. U. North Carolina, Chapel Hill), J. L. Irvin and H. P. Morris. *Cancer Res* 30(4):1075-1080, 1970.

The effects of injected histones and poly-L-lysine upon the induction of tryptophan pyrrolase and tyrosine transaminase of Morris hepatomas (5123tc, 5123A, 5123C, 7793, and 7795) were compared with effects upon induction of these enzymes in the livers of the tumor-bearing rats. Hepatoma 5123tc in intact or adrenalectomized Buffalo rats had a low basal level of tryptophan pyrrolase activity and a high basal level of tyrosine transaminase activity compared to normal liver. Both enzymes were induced by hydrocortisone, but the induced level of tryptophan pyrrolase in the hepatoma was less than in the liver. Injections of histones or poly-L-lysine induced only tryptophan pyrrolase in the hepatoma in adrenalectomized rats. The rate of decline of induced tryptophan pyrrolase activity in the 5123tc hepatoma in the presence of puromycin was identical to the rate of decline in normal liver, indicating that the low basal levels and weak inducibility of this enzyme is probably due to a defect in its synthesis, rather than to an accelerated rate of degradation. However, no decline of hydrocortisone-induced tyrosine transaminase activity in the hepatoma was seen during an 8 hr period after induction compared to normal liver, in which the $t_{1/2}$ of the enzymes was 2.9 hr. Consequently, the high basal level of tyrosine transaminase in this hepatoma is probably due to a low rate of degradation rather than a high rate of synthesis; the rate of degradation of tyrosine transaminase in the liver of rats bearing this hepatoma was also decreased compared to normal liver, suggesting that the tumor may produce a circulating inhibitor of the degradative system for tyrosine transaminase.

7538 PRIMARY CARCINOMA OF THE LIVER: II. CLINICAL ASPECTS, LAPAROSCOPY, FUNCTIONAL DIAGNOSIS AND DIFFERENTIAL DIAGNOSIS OF HEPATIC CIRRHOSIS.

(Ger.) Ortmans, H. (St. Hosp. Kassel, Germany), H. Selmair and E. Wildhirt. *Munchen Med Wschr* 112(26):1251-1257, 1970.

Clinical course, laparoscopic examination and chemical laboratory tests were used as criteria for the differential diagnosis of primary carcinoma and cirrhosis of the liver. One hundred and three cases of primary hepatic carcinoma were diagnosed by laparoscopy (32), by laparoscopy and histological investigation of biopsy material (6), at autopsy (64), and by post mortem liver biopsy (1); hepatic cirrhosis was present in 99 of the 103 cases. In order to facilitate the differential diagnosis between primary carcinoma associated with regenerative cirrhosis and active cirrhosis, significance calculations of laboratory tests were performed in 2 comparable groups of 30 cases of primary carcinoma and of 30 cases of cirrhosis of the liver. The values of alkaline serum phosphatase showed a significant difference between hepatic carcinoma (134.38 ± 79.76 mU/ml) and hepatic cirrhosis (47.24 ± 20.83 mU/ml). The serum bilirubin level showed a significant difference (mean value difference 3.17 ± 1.2094 mg%) indicating that either the tumor itself or its effects cause an occlusion syndrome of the draining bile ducts. Serum transaminase and lactate dehydrogenase did not show statistically significant differences; the serum iron level was distinctly lower in the carcinoma group, while some fractions of serum electrophoresis were increased.

7539 EXPERIMENTAL HISTOLOGICAL AND ELECTRON MICROSCOPIC STUDY OF THE LIVER IN SHOCK.

(Fr.) Feroldi, J. (Hosp. Eduoard Herriot, Lyon, France), Y. Mallet-Guy, P. Braconnot, R. Guillet and P. Mallet-Guy. *Lyon Med* 65(5):720-734, 1969.

Conditions of hemorrhagic shock were produced in 27 heparinized (2 mg/kg) dogs by bleeding. Arterial pressure stabilizing between 50 and 90 mm Hg was considered to simulate moderate shock and below 50 mm, severe shock. Congestion, edema of the hepatic parenchyma, accompanying lesions of the sinusoidal wall, dilatation of the space of Disse, changes in the endothelial border observed as early as 2 hr after bleeding were probably related to the hemodynamic changes in shock, in particular, to the increase of hepatic resistance to portal circulation. Cytological lesions characterized by disapperance of glycogen and structural alterations of mitochondria and rough endothelium which correlate with hyperglycemia and increased blood levels of lactic acid may indicate altered citric acid cycle activity.

7540 MORPHOLOGICAL DIFFERENCES BETWEEN ESOPHAGEAL AND PORTAL VEINS IN PORTAL HYPERTENSION.
